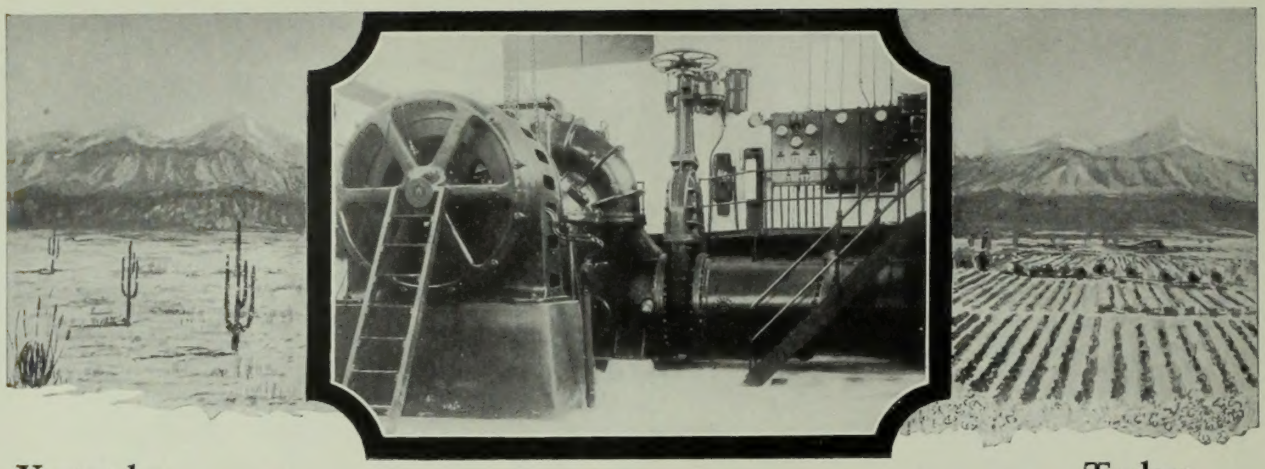
An Organized Voice for the Forces of Agriculture and Industry Which are Primarily Dependent Upon Irrigation



Yesterday
34,000 Acres of Barren Waste Land

Today
Luxuriant California Farmland At Its Best

"The magic touch of water
On a sun-baked desert land
Transformed it as by magic
Into productive golden sand"

Westinghouse Motors Serve A Great Irrigation Project

WESTINGHOUSE plays an important part in reclaiming the desert wastes of the West into fertile fields of luxuriant production.

Supplying water to 34,000 acres of arid waste land was one of the recent reclamation problems where it was up to Westinghouse to supply the correct motors to drive pumps of 157,000 gallons capacity per minute.

Two 650 hp. CS motors were used. Long life and maximum efficiency are built into this type of Westinghouse squirrel cage motor in the form of—

Double impregnated mica-insulated coils

This is absolute protection against moisture or high temperature.

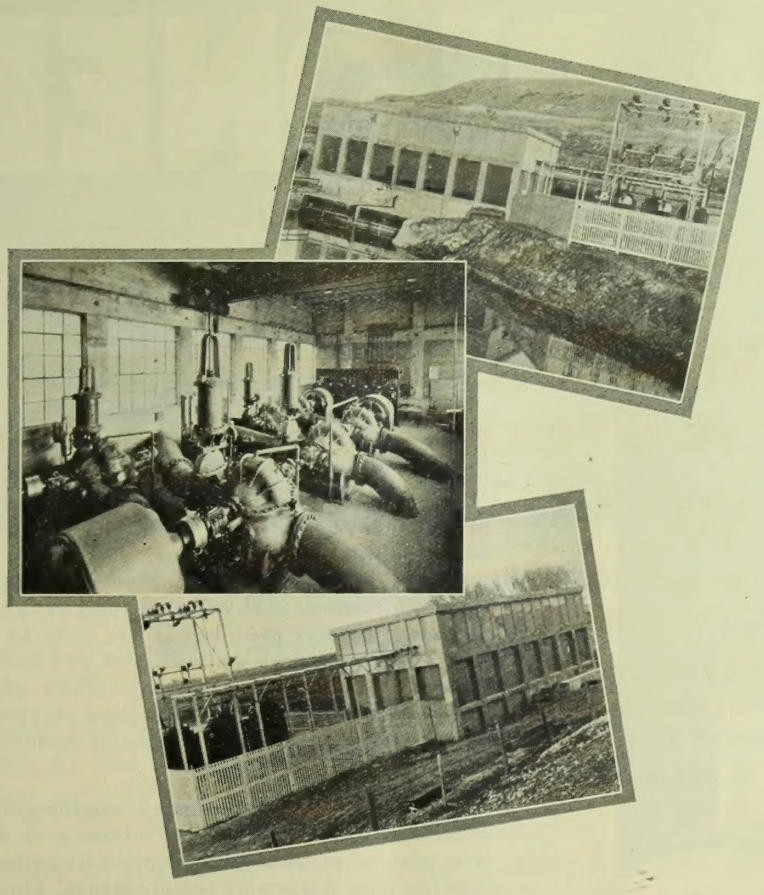
Irrigating at Heads of 300 Feet



THE Bonnieville Irrigation District plant at North Salt Lake is a noteworthy example of a Byron Jackson installation for heavy irrigation service. This plant consists of four Type S pumping units direct-connected to electric motors with a total capacity of 36,000 gallons per minute.

Half of this water is pumped against a head of 150 feet and the remainder to 300 feet. There is a total of 3000 horsepower installed.

Complete engineering information on pumping plants for any head or capacity is available on request.

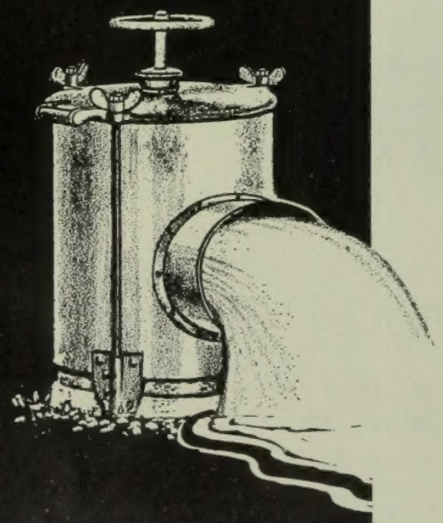
Introducing A PIONEER



WE MAKE the Original line of Irrigation Appliances, Outlet Valves and Cut-off Gates for the definite division and economical distribution of water over the field from Concrete Pipe lines.

If you are interested in irrigating a tract of land of any character, large or small, you will do well to communicate with us. We are in touch with the leading Concrete Pipe manufacturers of the Southwest and will refer you to the nearest one. If your property is not close to an irrigation contractor, we will give you complete information regarding the MARTIN plan of making the concrete irrigation pipe on your own ranch and installing the irrigation system complete.

We maintain an experienced engineering department which will gladly advise you on the best plan of installing a complete irrigation system for your particular requirements. Our service is most complete, and is based upon a desire to be absolutely unbiased in its recommendations.

Write us at once for our late catalogues.

IN THE WEST • IT'S "WESTERN"

WESTERN *does its bit*

Through the medium of dependable plate steel irrigation equipment, this company has been privileged to share in the upbuilding of the vast agricultural resources of the West. Never has the steel work of any project been too large for our five modern plants to handle, or any minor installation too small to warrant our attention. In fact---special or standard---any size, any shape, "Western" can build it. Our engineering counsel is at your disposal.

An inquiry will bring complete details on the product you are interested in

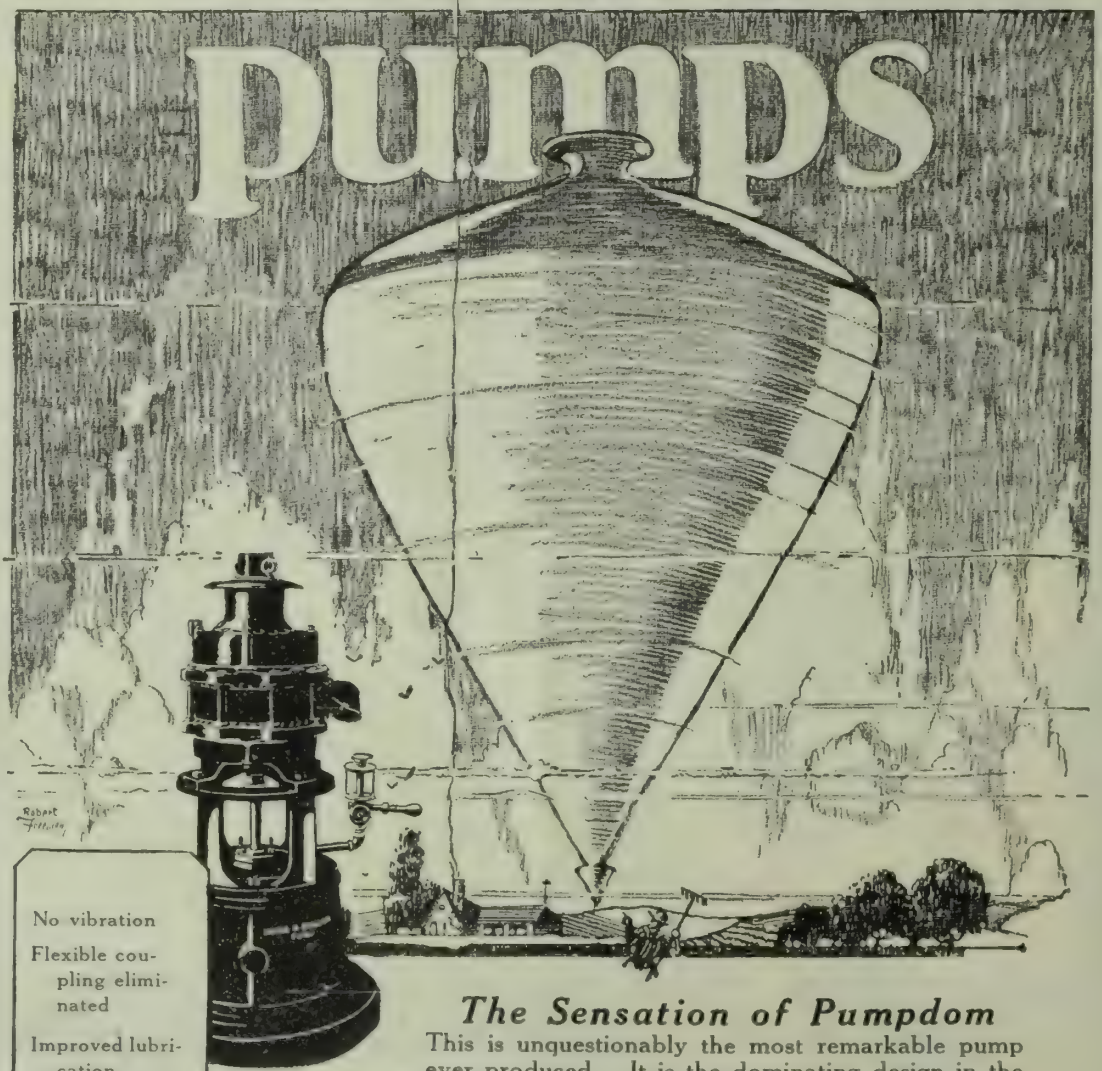
The Layne & Bowler TOP DRIVE PUMPS



- No vibration
- Flexible coupling eliminated
- Improved lubrication
- Full floating shaft
- Accurate alignment
- 3-point bearing
- Easy accessibility

Send immediately for complete descriptive Catalog No. 10.

The Sensation of Pumpdom

This is unquestionably the most remarkable pump ever produced. It is the dominating design in the irrigation field, permitting of longer life, freedom from vibration, assuring lower power bills, and sustained efficiency over long pumping periods. There are 125 sizes and capacities of Layne & Bowler Turbine Centrifugal Pumps adapted to our new Top Drive.

Just the Power for Many Pumping Jobs

A Climax "Trustworthy" Power Unit mounted on a handy skid-sled base, making it easy to move to the job. Requires no special foundation. Carries its own cover, which locks to prevent tampering.

Has large fuel supply tank, positive lubricating and cooling system. Requires least possible attention. Built in sizes to deliver 25 to 100 H. P.—4 or 6 cylinder. Especially suited to pumping jobs where you want "trustworthy" power with the least attention required from the operator.

BOARD *Of* ADVISORS

AS COMPLETED TO JUNE 15, 1925, INCLUSIVE

Representing Agriculture

CHAS. C. TEAGUE,

President California Fruit Growers' Exchange; President, California Walnut Growers' Association.

A. C. HARDISON,

President California Farm Bureau Federation.

J. V. MENDENHALL,

President, California Delta Farms, Inc.; President, Holland Land Co.; President, California Approved Land Settlement Assn.

Representing Engineering

ARTHUR P. DAVIS,

Chief Engineer and General Manager, East Bay Municipal Utilities District; formerly President, American Society of Civil Engineers; for 20 years Director, U. S. Bureau of Reclamation.

LOUIS C. HILL,

Of Quinton, Code & Hill, Consulting Engineers; formerly Supervising Engineer, U. S. Bureau of Reclamation.

CARL E. GRUNSKY,

President, American Engineering Corporation; formerly President, American Society of Civil Engineers.

W. F. McCLURE,

California State Engineer and Chief of the California Bureau of Public Works.

EDWARD HYATT, JR.,

Chief, Division of Water Rights, California Bureau of Public Works.

A. L. SONDEREGGER

Consulting Hydraulic Engineer and authority on ground water problems.

R. V. MEIKLE,

Chief Engineer, Turlock Irrigation District; and Chief Engineer, Merced Irrigation District.

Representing Irrigationists

WILLIAM DURBROW

President, Irrigation Districts Ass'n. of California; Secretary and General Manager, Glenn-Colusa Irrigation District.

GLENN D. SMITH,

President, California Mutual Water Companies Assn.

GEORGE L. SWENDSEN,

General Manager, Fresno Irrigation District.

Representing Land Settlement

J. V. MENDENHALL,

President, California Approved Land Settlement Assn.; President, California Delta Farms, Inc.; President, Holland Land Company.

GEORGE E. SPRINGER,

Vice-President, California Approved Land Settlement Assn.; Sec. and Gen. Manager, Alameda Farms Co., Alameda Sugar Co., and Union Commercial Co.

Representing Irrig. and Rec. Law

ALBERT E. CHANDLER

Of Haven, Athern, Chandler & Farmer; formerly President, California State Water Commission; Counsel for various irrigation projects; author of "Elements of Irrigation Law."

DAN HADSELL

Of Hadsell, Sweet & Ingalls; Counsel for many irrigation enterprises; authority on reclamation law.

Repr'g Investigations and Research

FRANK ADAMS

Professor of Irrigation Investigations, College of Agriculture, University of California.

B. A. ETCHEVERRY

Professor of Irrigation Engineering, University of California; author of several standard works on irrigation.

SAMUEL FORTIER

Senior Irrigation Engineer, Division of Agricultural Engineering, U. S. Dept. of Agriculture; Consulting Irrigation Engineer, University of California; formerly Irrigation Advisor to the Province of British Columbia; author of books and numerous publications on irrigation practice.

Representing Conservation

GEORGE C. PARDEE,

President, East Bay Municipal Utility District; formerly Governor of California and widely known for his activities on behalf of conservation measures.

FRANCIS CUTTLE,

President, Riverside Water Co.; President, Water Conservation Association; well known advocate of conservation measures and an authority on re-forestation.

PAUL G. REDINGTON,

District Forester, U. S. Forest Service, and Western Representative, Federal Power Commission.

M. B. PRATT,

California State Forester; an active worker for conservation in its application to irrigation and agriculture.

Representing Constructionists

ARTHUR S. BENT,

President, Bent Bros., irrigation general contractors, specializing in dam construction.

C. C. THOMAS,

Vice-President and Western Representative, Dwight P. Robinson & Co.

MELVILLE DOZIER,

Manager, Construction Industries Joint Committee; formerly Calfiornia State Flood Control Engineer; formerly Chief Engineer, Pacific Electric R. R. Co.

Representing Equipment

C. F. ZIMANSKY,

President, Western Irrigation Equipment Assn.

C. A. UTLEY,

Secretary, and formerly President, Western Irrigation Equipment Assn.

K. E. VAN KURAN,

District Manager, Westinghouse Electric & Mfg. Co.

WM. ANGUS,

President and Gen. Manager, Western Machinery Co.

S. F. FORBES,

Pacific Coast Manager, Fairbanks, Morse & Co.

N. B.--Several of the above groups are not complete at this writing. It has been suggested, by several of the Board members, that special groups should be formed to represent "Irrigation Finance" and "Public Utilities." A number of men have been suggested for membership on one or another of the present groups, and they are being considered with reference to their special qualifications. All groups are subject to enlargement hereafter, in order to insure strong representation for each important phase and division of irrigation and its allied interests; and in order that other sections may have representation commensurate with the status of hydraulic development in such sections. See "A Voice for Irrigation," on pages 11, 12 and 13, and explanatory article on pages 14 and 15.

POMONA IRRIGATION EQUIPMENT

Pomona PLUNGER PUMPS for DEEP WELL PUMPING

Highest Efficiency Guaranteed

EXPERIENCED water users have learned that the technical term "efficiency" is connected with power bills. The efficiency of POMONA DUPLEX PLUNGER PUMPS is much higher than the efficiency of any other type of pump. Our pumps operate at high efficiency regardless of changes in the water level.

These pumps operate at low speed, eliminating friction troubles and lubrication defects. They are adaptable to shallow and deep wells and records prove that their cost of upkeep is less than any other pump operating under similar conditions.

Many Pomona Pumps have been in operation for 20 years continuously and are still giving perfect service. Made in all sizes from 5 horsepower to 80 horsepower; belt drives or direct motor drives.

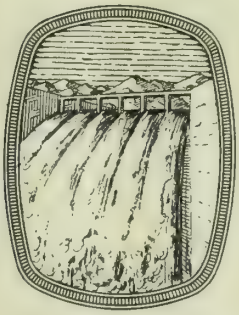
Petroleum World 626 S. SPRING ST., LOS ANGELES, CALIF. Modern Irrigation

WILLIAM MARION JARDINE, LL. D.

Who became the head of the United States Department of Agriculture in March, and who is now making an extended tour of the far west, becoming more familiar at first hand with the special problems of irrigated agriculture. Dr. Jardine spent most of his early life in Idaho and Montana, and understands fully the importance of irrigation to American agriculture. As the result of his present contact with the men and problems of the irrigation country, it is expected that his department will adopt an aggressive program for the furtherance of sound irrigation policies.

MODERN Irrigation

The Magazine of Applied Hydraulics



Volume 1 JULY, 1925 Number 1

A Voice for Irrigation

THIS new journal, dedicated to the interests of those who are serving America by pushing her boundaries outward, increasing her wealth, harnessing her natural resources and putting them to the service of her ever-growing population, through irrigation, is brought into being by the demand of circumstances.

The Great West stands in an eventful hour. Its history has been a record of prodigal exploitation. It offered to the early pioneers a vast new empire, with a horizon of staggering sweep, and resources apparently limitless in extent. But it required only a few decades for the appropriation of the riches most easily grasped; then started the era of agricultural development. Fertile acres, ready to yield in abundance, were apparently plentiful, requiring but the most casual care to return enormous crops. These too, however, soon disappeared; the westward trend of population and the demand for increased efficiency made the returns of unwatered areas inadequate.

But the magic of water was called to the task; and by this marvelous force the lands already under cultivation were made a hundred-fold more productive; while millions upon millions of acres which had been the undisputed realm of the cactus and the coyote were transformed into flowering garden spots. The supply of land which could be thus brought into use appeared measureless, and apparently in the everlasting snows and the turbulent streams which they fed there was water enough and to spare.

So, from stage to stage, the west has gone, confident that its wealth was inexhaustible, and the future amply provided for in the beneficent bequests of nature.

But now, in the second quarter of the twentieth century, for the first time, that assumption is being questioned and refuted. The cream has been skimmed; the remainder, rich enough in all truth, is for the first time being used with something like a realization that there is not an infinite supply. Already, where the ingress of population has been most rapid, and the development of land and the appropriation of water most intensive, those most concerned, at least, are recognizing that the problem of imminent exhaustion actually confronts them.

California, where irrigation has furthest progressed, is facing a condition recently expressed in these words: *"Much of California's agricultural lands have less water in their vicinity than is required*

by them for maximum productivity, and . . . . the total supply, even with complete conservation, is barely adequate to meet the state's potential demands for water."

IN OTHER parts of the United States where irrigation is extensively employed, comparable questionings are causing grave concern to those who have developed their water supply with blind confidence that its limit would never be reached. In other states, not so far removed from the primeval condition, and just entering (comparatively speaking) the era from which California is now emerging, these doubts have not yet been generally felt—an appreciation of the true condition exists only in the minds of an informed minority of their technical men. But the realization is coming, wherever irrigation is employed, and that at a time not far off.

With this recognition of the grave problems attendant upon irrigation and its allied fields of industry, there come new needs, never before encountered. Where unco-ordinated and disorganized development has served in the past, the present demands co-ordinated action in accordance with a dominant plan which recognizes the needs of tomorrow as well as of today. Communities in need of water find themselves unable to satisfy that need by a random appropriation of the nearest stream; their desires and interests come in conflict with those of other communities, and the result is inharmony, antagonism, and a delay for needed progress. Whole states find themselves at variance over the proper disposition of their vital resources, and there is no guiding voice to point the way to an equitable settlement; no proper authority to enforce it.

Correspondingly, there is coming a tardy recognition of the inter-dependence of all the problems dealing with the exploitation of the land. Land settlement boards, flood control commissions, irrigation projects, domestic water companies, hydro-electric interests, and various other agencies for the management of drainage, reclamation, conservation and for kindred objects have been doing their work under different heads, along different lines, and often at cross-purposes, with an inadequate realization of the fact that they represented merely different phases of the one great purpose. A clearing house for the activities of these instrumentalities, which might serve to relate and consolidate their achievements, has been a vital lack.

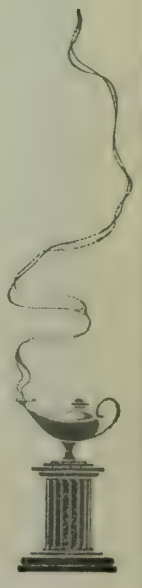
On the other hand, with the increasing utilization of available water resources, the problem of the consumer or "water user" has been made a more difficult one, involving highly complex economic and technical factors. There has been much admirable educational work done by various agricultural organizations to help the farmer in the solution of his problems as a user of water, but it has been incomplete.

These tremendous movements all point toward one great conclusion—*the need for a Voice.* Irrigation needs a voice—not the voice of any single, self-concerned interest, for there are many of these, each shouting aloud and trying its best to drown out those which are not declaiming the same message and gospel; not the voice of a political organization, circumscribed by political considerations and statutory limitations; not the voice of the man with a panacea, who would force his plan down the reluctant throats of all irrigationists. But the voice of a sincere, serious, plain-spoken tribune, unsubsidized, unwedded to any particular plan or theory, eager only to present to all those interested in water problems the best that can be gathered together from the multifarious fronts on which the army of Irrigation—and its kindred hydro-industrial enterprises—is active.

IN relation to all these problems, the element whose welfare is most vitally involved—the public—is silent, apathetic, ignorant. The engineers may point out the need for far-seeing vision; the wiser legislators may attempt to further the progress of irrigation through sensible laws; but the public remains content either to let the future of its most important physical possessions, its soil and water resources, be determined by those whose concerns are not generally unselfish; or, worse, allows its resources to be dissipated, often times destroyed, through the lack of proper conservation measures, without lifting even a feeble voice in protest.

These are the circumstances, and these the considerations, which have demanded, with an insistent call that can not be resisted, the establishment of such a magazine as MODERN IRRIGATION.

This journal is not launched with the idea that it can provide a ready answer to the myriad riddles which surround the present status of irrigation affairs, or direct its future with infallible wisdom. On the contrary, it begins publication with a keen appreciation of the great immensity of its field and the necessary insignificance of any single element, realizing that such an enterprise must, by a gradual process and by prestige well earned, extend its sphere of influence in increasing circles until by its own accomplishments, and with the whole-hearted cooperation of every agency working for the same desired ends, it deserves to be regarded as an authoritative spokesman.



If Irrigation has been dumb for the lack of a Voice in the past, it will not become at once eloquent because of the establishment of this journal, but it is our hope and aspiration that MODERN IRRIGATION may, from the very beginning, form some syllables of its great message in intelligible, constructive form; and, with the passage of time, may become a strong, clear voice of wisdom, speaking as one having authority.

IN THE conception of this enterprise and the execution of its first steps, the publishers have been content to proceed slowly. The idea of MODERN IRRIGATION has been developing for years. The experience of its publishers in the field of industrial journalism had shown them both the need and the opportunity for a class magazine dedicated, primarily, to the service of the irrigation industry, the fundamental basis of the West's present and future prosperity. Actual work on the enterprise was begun more than a year ago, when the publishers began a series of conferences with influential and representative men vitally concerned with irrigation, whose positions are such that they can recognize the need for such a magazine as this.

The conferences with these leaders of irrigation manufacturing, irrigation finance, irrigation management, irrigation engineering and irrigated agriculture have led, by a natural process, to the formation of a Board of Editorial Advisors, comprised by these leading figures of the industry who have promised to give their interest and thought to the guidance of the magazine along the most useful lines. None of these men are serving for compensation; none of them are personally interested, directly, or indirectly, in the financial success of the magazine; their participation in its direction is merely a manifestation of their vital concern in the advancement of irrigation. Their advice and counsel will be proffered, often at a sacrifice of their own leisure time, in an effort to make MODERN IRRIGATION of maximum usefulness to the irrigation and reclamation movement.

These Advisors represent no one faction, no "interest," no particular division of the industry or section of the country. But they do, in the aggregate, represent a gratifying evidence of the instantaneous response which MODERN IRRIGATION has elicited from the far-seeing men in all the divisions of the irrigation world.

As to the future performance and value of the new magazine, we are content to let our columns speak for themselves. Pledges mean nothing, and promises are empty, unless they are tangibly supported in actual accomplishment. But of this we are convinced—the opportunity is present for genuine service, limited only by our own capacity for accepting it. And this we know—that our intention is to seize that opportunity and make our journal an outstanding force for the advancement of this, the West's greatest industry—hence of *all* industry throughout the West. Our success will better be judged by our readers than by ourselves, as it is manifest in succeeding issues.

There are great controversial questions shaking the world of irrigation today; there are policies which are undergoing radical transformations; there are conceptions which are being made over and reshaped as theory is met and overcome by experience. In questions of this kind, our purpose will be to contract no alliances with factional groups, to espouse no disputed doctrines—rather to help in finding the wise course of action by avoiding preconceived ideas and controversial affiliations, and to search for the truth as it may appear.

OUR ideal for our magazine will be unsatisfied unless, in each issue, there shall be something of practical and vital value for every one whose interest lies in irrigation, or who, in the allied hydraulic fields, will find the magazine of an equally practical service to them. Our purpose will be to select our editorial contents on such a basis that the smaller water user, who is concerned with bringing water to his land at the smallest cost and greatest efficiency, will find help in earning a better living and in growing better crops; the large irrigator will find suggestions that he may put into practice in solving the problems of managing his more extensive activities; the engineer will encounter new ideas which will add to his store of information and his skill in coping with the technical aspects of the industry; the executives of the irrigation district and the irrigation project will read of the experiences of other managers and find new inspiration and new help for their tasks—and so on, through the list.

And through the composite contents of the magazine, a great industry, a great constructive movement, may speak, not only to its own members, carrying on the work of subduing nature and of bending its forces to the service of mankind in many parts of the world, but, through the endless circles of influence set in motion, to the man in the street, in such a tone and with such an attention-commanding message that he will pause, and listen; and the vast, far-flung forces of the industry, which are faithfully working in his service, will at last have found an articulate Voice.

A. C. HARDISON

C. C. TEAGUE

J. V. MENDENHALL

Who comprise the present membership of the Agricultural Group of MODERN IRRIGATION'S *Board of Editorial Advisors*

Leaders of the Irrigation Industry Will Serve as Advisors to *Modern Irrigation*

By DOUGLAS G. McPHEE

NEVER was an infant ushered into the world under more favorable auspices than the baby MODERN IRRIGATION. Never did a more auspicious group of god-fathers welcome its coming, and scan with attentive interest each of its salient features. Thirty prominent westerners — men whose names are familiar wherever irrigation is practiced, and whose titles stand for constructive usefulness in the irrigation world—will read with heightened interest this introductory number of MODERN IRRIGATION; because they are, in a sense, its god-fathers, members of its Board of Editorial Advisors.

These men have endorsed the plans and purposes of the new magazine, as they have been set forth by its publishers, and without personal concern in its success except as they are interested in the advancement of the entire irrigation movement, have pledged to it their support and their personal co-operation.

This group of men includes the recognized leaders of the several lines of endeavor most intimately related to irrigation—agriculture, industry, education, law, finance, conservation and engineering. Most of them are known throughout the entire irrigation industry; many of them are national or international figures.

GEORGE C. PARDEE
Conservation Group

It is these men who will help to guide the publication in the course of maximum usefulness to the field which it will serve; and it is their willingness, acting without compensation or concern in the business success of the venture, to participate in its direction, that constitutes its greatest endorsement to is readers.

IF a magazine, like a man, may be judged by the company it keeps, MODERN IRRIGATION begins its career deserving of the most favorable judgment. For probably never before in the western irrigation industry has a single group been organized to include, within its personnel, so many of the acknowledged leaders of the agricultural, industrial and professional life of the West as those activities touch upon irrigation.

The entire Board of Advisors has not yet been completed, for it is the intention of MODERN IRRIGATION to make it representative of not only each separate line of work with which irrigation is in constant contact, but of each geographical section of the irrigation empire. The membership will shortly be completed by adding men from each western and mid-western state occupying commanding places in the irrigation activities of their section, and other men in each of the main groups represented in the present membership who have not yet been approached, but whose prominence in the industry is such that their co-operation would be decidedly helpful.

THE formation of the Board of Editorial Advisors is a part of the general plan upon which MODERN IRRIGATION has been launched—a vital part of which is to make this publication not only an organ *for* the irrigation industry, but *by* the irrigation industry, with its policies and program dictated by the actual needs of irrigationists and irrigators.

That the leaders of the industry are sincerely and unselfishly interested in contributing their due part toward the welfare of the whole irrigation movement, without thought of direct personal gain, has been conclusively demonstrated by their willingness to serve as members of this Board. The publishers, in explaining their enterprise and asking for the co-operation of these men, expected to have to "sell" the idea by pointing out, in much detail, the great field and need for the publication. But in this they were most agreeably disappointed. In every case the individual approached, from his position of familiarity with the needs of irrigation, immediately recognized the potential value of such a publication, based upon the conservative and constructive principles outlined, and, having been satisfied that there was no "joker" concealed in the request for his endorsement, and his participation in its direction by counsel and advice, assented readily to lend his support in the guidance of its editorial policies.

THE nucleus of groups representing Agriculture, Engineering, Conservation, Land Settlement, Irrigation and Reclamation Law, Irrigation Management, Construction, Equipment and Research has been formed as a preliminary to the publication of the first issue, and each of these will later be completed by other outstanding authorities under the same classifications. To these will be added individuals representing the various sections of the west where irrigation is extensively practiced.

Each of these men has been carefully chosen as a representative of some particular aspect of irrigation, and each, by his experience or his official position—and in most cases both—has something definite to contribute toward making MODERN IRRIGATION a well rounded magazine of universal appeal.

M. B. PRATT
Conservation Group

PAUL G. REDINGTON
Conservation Group

The members of each of the groups comprising the Advisory Board will be introduced in coming numbers of the magazine. In this issue there is space to present only a few—the seven men who already have accepted membership on the Agricultural and Conservation Groups. They have been selected for this introductory number because they represent, in a sense, the basic and fundamental interests with which irrigation has to deal.

Three men comprise the membership (to date) of the agricultural group: Charles C. Teague, J. V. Mendenhall and A. C. Hardison.

Mr. Teague, as president of the California Fruit Growers' Exchange and the California Walnut Growers' Association, is a national figure in co-operative marketing, and has made a reputation for success in various private and corporate agricultural enterprises. He sums up the story of his relationship to irrigation by saying: "I came to California in 1893, and have been engaged in the development of lands, which development has primarily consisted of bringing water to the land and planting it to orchards." He is president of the following large agricultural and irrigation enterprises: Limoneira Company, Teague-McKevett Company, Farmers' Irrigation Company, Santa Paula Water Works, and the Thermal Belt Water Company, all of Santa Paula; the California Orchard Company, of King City, California, and vice-president of the Salinas Land Company, of King City. Mr. Teague's home is at Santa Paula.

FRANCIS CUTTLE
Conservation Group

J. V. Mendenhall is a native Californian whose interests have been intimately identified with the land for many years. He is president of California Delta Farms, Inc., the Holland Land Company, the California Approved Land Settlement Association, and the California Delta Potato Growers' Association. For three years he served as president of the California Bean Growers' Association. Mr. Mendenhall, through his various connections, is vitally interested in all phases of irrigation development, with especial concern in the great half-million acre area of the San Joaquin and Sacramento River deltas. His attitude toward irrigation is expressed tersely in his statement: "We all agree that the water question is the most vital and important question calling for solution in the west." Mr. Mendenhall lives in Stockton.

Needs of Expanding Agriculture in America Call for New National Reclamation Policy

Oregon Senator Outlines and Explains Plan for New Legislation to Supplement Present Reclamation Act

By SENATOR CHARLES L. McNARY

Chairman, United States Senate Committee on Irrigation and Reclamation

RECLAMATION by irrigation has been practiced in the seventeen arid and semi-arid states since 1902. In all of these states there are large quantities of government owned lands untaxed and untaxable. In eleven of these states over 60 per cent of the land is owned by the national government. Realizing the great handicap these states suffered by reason of the large areas of untaxed lands, former President Roosevelt urged Congress to pass the original Reclamation Act.

The money necessary for this development was not taken from the Treasury of the United States but was created from a special fund accruing from natural resources within these states, such as royalties from oil and coal fields on the public domain, pasturage fees and charges, and a portion of the sales of public lands. This development work has involved the expenditure of 150 million dollars taken from this special fund. As a consequence of this expenditure, there are two million acres of land being supplied with water which were heretofore barren and unproductive, and which have added to the national wealth property values exceeding six hundred million dollars.

AS the country becomes more thickly settled and populated, and as we exhaust our available agricultural lands, there will be an ever increasing demand for the development of additional reclamation projects, many of which are vastly too large ever to be built out of the present reclamation fund, which has an annual increment of about eight million dollars. It is my opinion that this sum should not be diverted from the development of small and feasible projects in the states wherein there is a large area of government owned lands, and that the original act should be preserved in its full integrity. However, as the country increases in population, there will come a demand for the expansion of our agricultural area, and it is for that reason that I believe the government should establish a national reclamation policy.

This plan should include all forms of reclamation, applicable to the conditions in the various states of the Union. It may take the form of reclamation by the removal of water from the wet lands of the south, or conducting water to the dry lands of the intermountain and Pacific Coast states; the removal of stumps from the cutover lands in the Great Lakes states; the flooding of the lands in the Mississippi Valley states to provide for sub-soil irrigation, or the restoration of the soil in the New England states; indeed, every state would experience an increase in taxable wealth if some form of reclamation was practiced, provided there was a demand for the enlargement of farm production.

WHEN we consider reclamation by irrigation there come before us the important factors of flood control and the development of hydro-electric energy. A typical case is the proposed development of the Boulder Canyon in the Colorado River, where by the impounding of its waters a great amount of power can be developed at a cost that would seem to justify the venture. At the same time, the waters of the Colorado could be controlled in flood time so as to prevent the losses annually attendant upon the late spring freshets caused by the melting snow high in the mountains. In addition thereto, water can be supplied for thousands of acres of fertile lands in the Imperial Valley in California and those acres that lie across the border in Mexico. It is a worthy project that should be undertaken, even though perhaps the ultimate cost of the development would amount approximately to three hundred million dollars. The great Columbia River project lying in the far Northwest is similar in character. Many other potential developments could be specified in the various parts of the country.

WHEN the demand for increased agricultural acreage is keen and the necessity apparent, great drainage projects will be undertaken in the South, involving the expenditure of many millions of dollars. Likewise a call will be made for the clearing for cultivation of the cut-over lands along the Great Lake states. and the reclamation of soils in the New England and Atlantic states.

It is my humble judgment that Congress will not desire to take up these projects one by one, or two by two, by appropriation directly from the Treasury of the United States. Such a policy would encourage log rolling; it would incite jealousies among the advocates of the various projects desired to be developed, with the resultant effect that the whole scheme would fail by reason of the unscientific plan upon which it was based. The government needs a comprehensive and constructive policy of reclamation which can be invoked whenever the needs of an expanded agriculture occur. Legislation of this fashion must avoid the appearance of carrying federal aid to the point where it may be denominated a subsidy, and such a term could be applied if each of the various projects were to be constructed out of funds directly withdrawn from the Treasury.

IF Congress should enact legislation carefully protecting moneys advanced for this purpose, by exacting adequate security and assuring liquidity of the sums allocated among the various projects, the plan would not challenge the opposition of those unfavorable to Federal assistance. This legislative program would involve obtaining from the Federal Treasury a large sum of money approximating three hundred to five hundred million dollars to be advanced toward the construction of new projects found feasible by some department of the government. The individuals included within the development would have to incorporate themselves into a legally organized unit conformable to state statutes and agreeable to government requirements. The organization would be required by law to issue its bonds bearing the current rate of interest, and whensoever the project was a going concern and its soundness was attested by a proper agency of the government, the bonds would be sold to private investors

(*Continued on Page 48*)

MODERN IRRIGATION *wishes neither to endorse nor to disapprove Senator McNary's new reclamation measure, but presents this article for its informational interest.—Editor.*

THESE PICTURES MIGHT BE CAPTIONED "CAUSE AND EFFECT". WATER AND ELECTRICITY, THE COMBINATION SUGGESTED AT THE LEFT, MAKE CALIFORNIA A LAND OF FINE HOMES AND SPLENDID CROPS.

What *Electricity* is Doing for Irrigated Agriculture in California

By FREDERICK S. MYRTLE

Editor, Pacific Service Magazine

CALIFORNIA has developed the application of electrical energy on the farm to a greater extent than any other section in the country, if not in the entire world. Her position in this regard is due primarily to two factors: first, cheap and available hydro-electric power; second, the elaborate interconnected system of transmission lines, traversing every section of the great interior valleys which are the chief agricultural regions of the state.

California contains approximately one hundred and one million acres of land, of which the area considered to be suitable for cultivation is estimated at twenty-two million acres. Now, to properly cultivate these lands there must be water, and California with her wet and dry seasons has not, in her natural streams, the constant flow that gladdens the heart of the agriculturist during the five months of the year when irrigation is an absolute necessity. As a rule, from April to October of each year neither rain nor snow falls in California; so that when the supply of snow in the mountains is exhausted and runs off in the various streams to the ocean there is little or no water flowing into the main rivers.

Particularly is this true of those that irrigate the two main arteries of the state, namely, the Sacramento and San Joaquin valleys, save that which comes from storage and from underground springs. To the storage reservoirs, therefore, California looks for the supply that will keep flumes and ditches full during the arid months of the year when, without their help, thousands upon thousands of acres of farm and fruit lands would perish for want of life-giving sustenance. Those storage reservoirs are provided through the extensive development of hydro-electric power that has been in process since the first plant was established on the American River twenty-nine years ago, and which is progressing today at an almost feverish rate to meet the demands of a fast growing civilization.

From those storage reservoirs run flumes and ditches that irrigate fruit and farm lands alike, while that most wonderful of appliances to which, more than anything else perhaps, the farmer owes his present day prosperity,—namely, the electric pump—has proved a veritable benefactor in the work of both irrigation and reclamation.

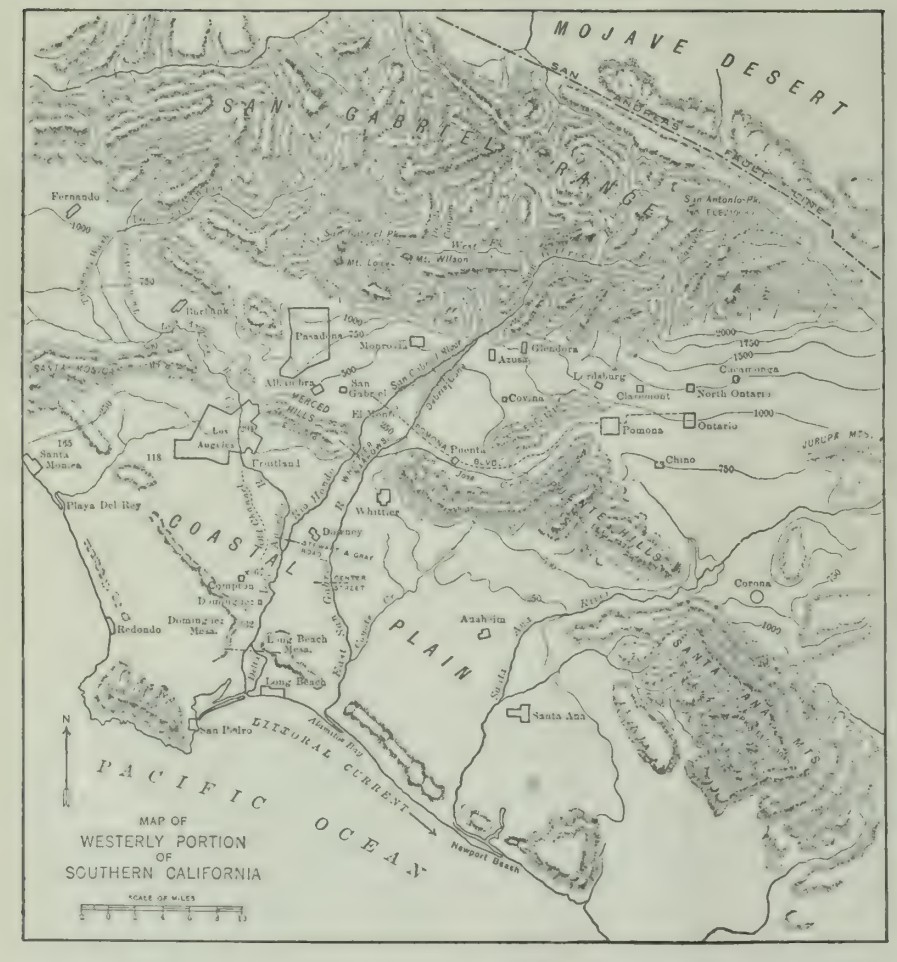
IRRIGATION has been aptly described as "crop insurance." Applied to conditions in California the description fits like a glove. From end to end of the Golden State there are long sweeping valleys of astonishing fertility that call for but intelligent cultivation to yield returns in boundless abundance. Modern science has pointed the way to intelligent cultivation and, given protection against Dame Nature's eccentricities, the California farmer can go his way contented. His protection, then, lies in irrigation in the arid sections and in reclamation in certain other sections of the country where the water supply promises to be too abundant at certain seasons of the year.

Irrigation is not a new thing; neither is reclamation; but both sources of prosperity to the tiller of the soil in California were, to all practical purposes, uncertain quantities until that great upbuilder, that greatest of all developers, cheap electric power, was made available, and the legend, "electricity on the farm," came to be generally inscribed on the banner of interior development.

It should not be necessary to remind the reader that the use of hydro-electric power generated in the Sierra Nevada Mountains and transmitted through the interior valleys to the large cities has had a marked influence on the varied industries that give California her place of prominence among the progressive states of the Union. Hydro-electric power has had the effect of creating new industries that, from an economic standpoint, were not possible before its introduction; and it has given a stimulus to other industries that were languishing even unto the point of death before this great public benefactor came to their rescue. Electric power has rejuvenated the mining industry; it has dotted the landscape of the interior with factories; it has helped extract the precious gold from the river beds; it has made the cement industry a most important factor in the state's development; it has solved the domestic problem to the point of positive luxury. But, if there is one thing more than another it has done to confer an everlasting boon and a blessing, it is the assistance it has given the farmer in his daily occupation and the protection it has afforded aganst the elements of risk that in early times made farming an extremely hazardous occupation.

In a section of the country where Dame Nature provides an average of three hundred days of sunshine out of every year it is indeed an advantage for the

(*Continued on Page 26*)



THIS MAP OF THE VALLEY OF SOUTHERN CALIFORNIA ILLUSTRATES MANY OF THE POINTS OF WHICH MR. SONDEREGGER HAS WRITTEN.

A Discussion of the Water Problems of the Valley of Southern California

By A. L. SONDEREGGER

THE VALLEY of Southern California faces water problems which are somewhat unique. The territory included in this term—which is here defined as all of Los Angeles, San Bernardino, Riverside and Orange counties—takes in not only the metropolitan area of the city of Los Angeles, one of the largest and most rapidly growing municipalities of the United States, but also some of the richest agricultural territory in the world. It embraces the watersheds of the Los Angeles, San Gabriel, and Santa Ana Rivers.

Commercially, this area is a unit, and is being increasingly so recognized. From the standpoint of its ultimate water supply it is no less a unit, and its problems must be so treated.

The chief factors affecting the water problem are:

(1) An irregular water supply with cycles of pronounced wet and dry periods in which the average supply differs about 3 to 1, and with a large portion of the flood flow wasting into the ocean;

(2) A marked shortage of supply, which would exist even if it were feasible to conserve all run-off and regulate the same to a cyclic average; this shortage is proposed to be supplemented from the Colorado River as the only available source;

(3) The necessity for large storage to regulate the irregular local supply, and any supplementary imported supply, to a heterogenous irregular demand which varies with the seasons of the year and with the relative wetness of wet and dry years.

THE water problem of this area resolves itself, therefore, into one of conservation of flood waste, in connection with flood control (to be solved individually for each principal watershed), and the importation of a supplementary supply to be considered for the Valley of Southern California as a unit.

These two problems are correlated and serve the same end.

It is accepted by many engineers that there are well defined cycles of 22 to 23 years consisting of periods of wet and dry years; 10 to 12 years in which the average rainfall and water supply is above normal, followed by a like period in which it falls below normal. The theory is based upon the results of the residual mass curve of rainfall and streamflow which, in turn, rests upon the fact that nature adapts itself to averages, accumulating moisture over a period of years and drawing on the same in the period following; otherwise the country would as one might say, either "dry up" or "drown."

The occurrence of periodical fluctuations of water supply has been proved by the Carnegie Institute, for 300 to 500 years back, from the rings of California Redwoods and from pines at Flagstaff and Prescott, Arizona. The periods average 11.4 years and follow closely the occurrence of sunspots.

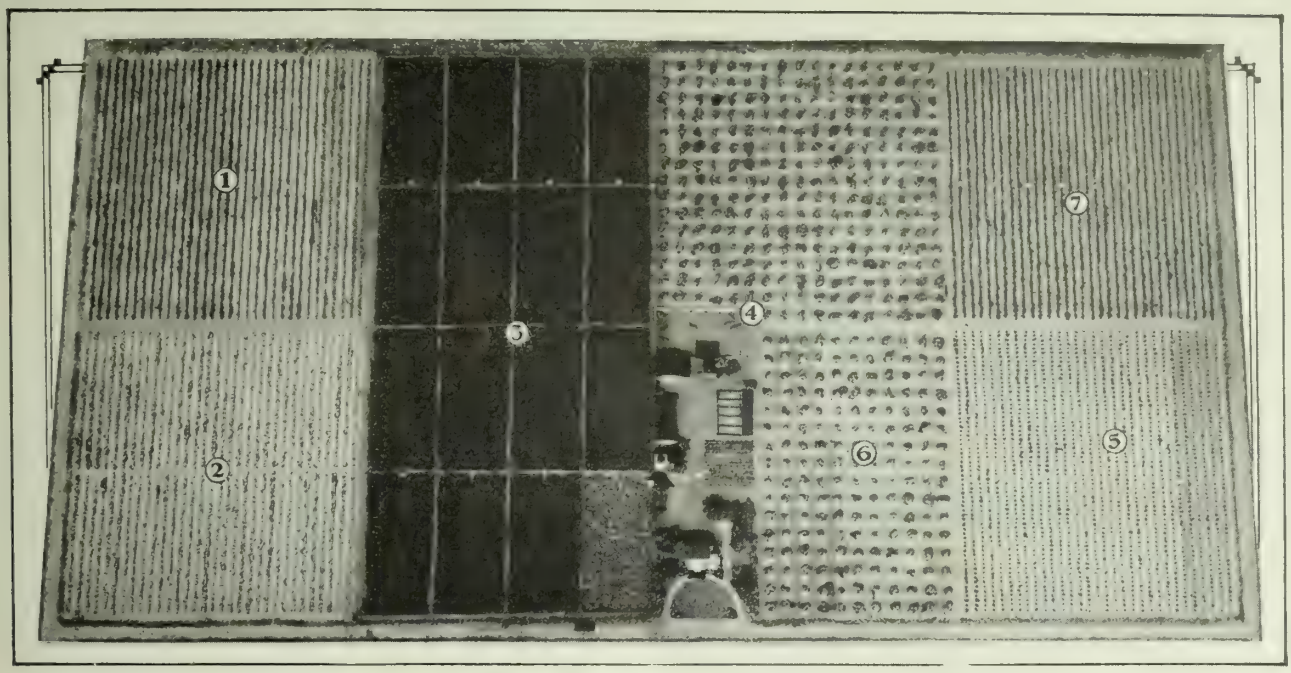
The averages of the seasonal run-off of San Gabriel and Santa Ana Rivers for the various periods are an indication of general water supply conditions, to-wit:

AVERAGE SEASONAL RUN-OFF—From STATE BULLETIN NO. 5

PERIOD	INDEX	San Gabriel River Watershed Acre Feet	Santa Ana River Watershed Acre Feet
1871-1883	Dry	116,700	226,400
1883-1893	Wet	234,200	334,000
1893-1904	Dry	61,600	159,000
1904-1916	Wet	206,200	317,000
1916-1927	Dry (Incomplete)	103,000	231,800
Wettest year	1883-84	720,500	553,400
Dryest year	1898-99	9,700	66,200

This table indicates a less imperfect regulation between wet and dry periods in the eastern watershed of Southern California, on account of more snowfall and the existence of flats at elevations of 6,000 to 8,000 feet, for which both the San Bernardino and the San Jacinto

(*Continued on Page 34*)



THIS EIGHTY-ACRE FARM IS ONLY EIGHT FEET LONG. ITS PROPRIETOR, SNOOK O'BRIEN, LEADS A MODEL LIFE AMID HIS DIVERSIFIED CROPS, COWS AND CHICKENS, ALL OF WHICH MAY BE SEEN IN THE PICTURE.

Model Electrified Ranch Tells Graphic Story of *Power Costs* on the Farm

SNOOK O'BRIEN is an irrigation farmer. He has gone through the experiences which are the common lot of the irrigation brotherhood, he has suffered all the ills that such flesh is heir to; yet he has persisted in his calling, and has achieved success.

Snook O'Brien's farm, and his products—even the cost of each element which enters into his expenses—are well known among the irrigationists of the west. He lives in a modern home in the middle of his modest acres, and is never seen by his neighbors; but the statistics of his enterprise, his profits and losses, have been noted and analyzed by scores of his brothers in the irrigation industry.

Snook's little farm is eight feet long, and four feet wide. His beautiful little home, thoroughly electrified with the most modern appliances, never echoes to the tread of feet across the threshold, for it is only of vest pocket size. And the reason that Snook himself, although so well known, is never seen engaged in tilling his land, or enjoying the well-won fruits of his labor under his vine and fig-tree is that Snook is a purely imaginary individual—or, rather, not imaginary, but a composite individual, representing the average irrigation farmer of a certain section of the west.

His farm is not merely a model farm in the sense that it is fully equipped with everything that the irrigator needs, electrified for convenience and efficiency from one end to the other, but it is a model, as well, in the Websterian sense of "a small imitation."

ON A table at the convention of the National Electric Light Association, being held this month in San Francisco, Snook O'Brien's farmstead may be seen and examined. It is offered as the contribution to the National Committee on the Relation of Electricity to Agriculture, by the Power Bureau of the Commercial Section, Pacific Coast Electrical Association. The display was largely worked out under the direction of A. M. Frost, manager of Sales of the San Joaquin Light and Power Company of Fresno, Calif.

"A great many of us," says Mr. Frost, who is chairman of the Commercial Section of the Electrical association of the Pacific Coast, "have had the idea for a long time of a display showing in graphic detail the application of electricity to agriculture. We believed that in order properly to tell the story of the value of electric power in the operation of irrigation plants we should have the information available in such an attractive form that those seeing it would be forced, by the interest of the display, to consider and analyze the figures submitted.

"Mere statistics and tabulations are dry reading—they don't get read at all, usually—and the Snook O'Brien farm is an attempt to present the ideal, electrified, irrigated farm in a form that tells the definite facts of costs, but in such a way as to impress even the casual observer."

THE model farm idea is hardly a new one, according to Mr. Frost—it has indeed been used many times in relation to many different aspects of the farmers' problems, but it is probable that it has never before been worked out in such detail, susceptible to such practical application, as in the hypothetical farm of Snook O'Brien.

In the compilation of data for use in this display many members of the Commercial Section have been active, and the Agriculture Committee of the Power Bureau has taken the matter up as one of its special activities.

Snook O'Brien's farm is an eighty-acre enterprise, devoted to diversified crops, including alfalfa, grapes, apricots, peaches, cotton, potatoes, milo maize, truck garden stuff, chickens and cows. In the display itself are visible the statistical tables of operation and production costs, so analyzed as to prove of help to the largest possible number of irrigation farmers.

The statistics used were compiled from averages as found in the San

Joaquin Valley, California, by members of the organizations carrying on the work, with the co-operation of others interested in agricultural work from other branches of the power industry.

Much of the information is taken from the files of the San Joaquin Light and Power Corporation, which, over a long period of years, has been serving power for the irrigation of land in this valley, and now serves about half a million acres in the district.

THE values of the crops and the tonnage records, as shown in the display, have been carefully considered, and are felt to be conservative. The nature of the O'Brien farm, with its diversification of crops, may, of course, lead to a better cost record than would be possible on a one crop farm. Referring to this advantage, Mr. Frost declares:

"The very great desirability of diversified agriculture is well appreciated throughout the state, and such diversity will, naturally, have a tendency to improve the load factor of the irrigation plants installed, benefitting both the power company serving the load, and the agricultural consumer. The consumer—in this case our friend Snook O'Brien—is enabled by the diversity of crops to keep his installation running a great number of months during the year, and, as a consequence, he gets into the lower blocks of the agricultural rate. He is also enabled to install a smaller plant than if his land were all planted to one product, for the reason that the one-crop ranch would require irrigation during only certain months of the year, which would increase demand and lower, or reduce load factor."

The photograph on this page of the model farm is a reproduction which does not do the O'Brien ranch full justice. It does, however, give a suggestion of the completeness with which it has been worked out.

The photograph shows only the farm proper. In the display itself, the most important part of which is the data which it incorporates, the farm is surrounded by tables showing the yield, return, cost, and profit on each of the eight crops produced, and setting forth in detail the items entering into the cost of irrigation.

EACH of the crops is taken up in detail, and with the aggregate costs are included the expenses incidental to the operation of the home, which is equipped with electric lights, range, water heater, sewing machine, vacuum cleaner, flat-iron, washing machine, toaster, percolator, fan and refrigerating machine, operated at a total power cost of $144. No financial return is shown from this expenditure.

"Of course," says Mr. Frost, "we believe that there is a distinct financial return from a properly electrified home on the farm, but as no products are produced that can be sold, we can not include this value in our calculations of profit."

"It is assumed that the water is being pumped for this farm, under a total head of 40 feet, which is about the average condition in the San Joaquin Valley," explains Mr. Frost. "We are, however, in many cases, supplying service on heads in excess of 150 feet, with very satisfactory results. We find that for the year 1924, the average cost for water in the San Joaquin Valley, produced by electric power on this system, was $1.27 per acre-foot. On a certain group of plants, (eleven, in number), with an average total head of 156 feet, five acre-feet of water was delivered on the ground at a cost of $2.56 per acre-foot. We consider these things very remarkable."

BENEATH the farm, in the display, appears this explanation:

"Snook O'Brien's Diversified Electrical Farm, Somewhere in the San Joaquin Valley, Calif.

"A presentation of the relation existing between power cost and gross return on an electrified farm, with a thorough diversification of products. The power costs were arrived at by calculating the performance of all electrical equipment based on actual experience. Such assumptions as had to be made on load factor, were carefully governed by selecting averages also based on farm practice. The final cost was computed by applying the proper rate schedule to the consumption thus figured.

"The method used to arrive at gross returns for the alfalfa, raisins, grapes, apricots, peaches, cotton, potatoes and maize products, was to take a reasonable average production, based on farm records, and apply an average selling price derived from an analysis of past and current market reports.

"For the returns from dairy and poultry products, the production figures were based on the assumption that select, high producers were used only. It was thought that average producers would not be warranted; when maintained on the comparatively small scale contemplated."

The following data are given for each of the eight crops represented:

Field No. 1, 10 Acres
POTATOES AND MILO MAIZE

Average yield	5 Tons Potatoes
Average yield	1½ " Maize
Total yield	50 Tons Potatoes
Total yield	15 " Maize
Selling price	$ 25.00
	35.00
Total return	1775.00
Acre ft. of water applied per year	44.00
Power cost per acre foot	1.24
Power cost for water per acre per year	5.43
Total power cost per year	54.26
Per cent of total power cost to total return	3.10%

Field No. 2, 10 Acres
COTTON

Average yield	750 Lbs. Seed
	¾ Bales Cotton
Selling price	3¾ Tons Seed
	7½ Bales Cotton
Selling price	20c
Total return	$843.75
Acre feet of water applied per year	31.20
Power cost per acre foot	1.24
Power cost for water per acre per year	3.83
Total power cost per year	38.32
Per cent of total power cost to total return	4.50%

Field No. 3, 10 Acres
ALFALFA

Average yield	8 Tons
Total yield	160 Tons
Selling price	$ 15.00
Total return	2400.00
Acre feet of water applied per yr.	100.00
Power cost per acre foot	1.25
Power cost for water per acre per year	6.17
Total power cost per year	123.45
Per cent of total power cost to total return	5.10%

FARM YARD—3 Acres

10 Cows, 150 Hens, Vegetables and Truck Garden		
Total yearly yield	6280 Lbs. Butter Fat	
	3000 Doz. Eggs	
	$100 Garden Truck	
Selling price	Butter Fat 40c	
	Eggs 20c	
Total return	Butter Fat $2500.00	$3200.00
	Eggs 600.00	
	Garden Truck 100.00	
Acre feet of water applied per year		$ 7.50
Power cost per acre foot		1.24
Power cost for water per acre per year		3.05
Power cost for Milking Machines		53.03
Separator		
Sterilizer		
Feed Grinder		
Yard Lighting		
Total power cost per year		$62.19
Per cent of total power cost to total return		1.90%

Field No. 4, 10 Acres
PEACHES (Green) ORCHARD

Average yield	6 Tons
Total yield	60 Tons
Selling price	$ 35.00
Total return	2100.00
Acre feet of water applied per yr.	25.00
Power cost per acre foot	1.24
Power cost for water per acre per year	3.09
Total power cost per year	30.86
Per cent of total power cost to total return	1.60%

THE EAST PARK DAM ON LITTLE STONY CREEK CONTROLS A RESERVOIR OF 51,000 ACRE - FEET CAPACITY.

What One *Successful* Reclamation Project Has Done--*Orland,* California

By R. C. E. WEBER

Superintendent, Bureau of Reclamation, Orland, California

THE Orland project, comprising about 20,600 acres of land, and constructed under the National Reclamation Act by the Bureau of Reclamation, is located in the north-central part of the Sacramento Valley, California, about 100 miles north of Sacramento.

The first steps looking toward the construction of this project were taken in 1906, when the Orland Unit Water Users' Association was organized, and a petition addressed to the Secretary of the Interior which led ultimately to the approval of the project and the beginning of construction.

The lands in this area were formerly devoted to raising grain crops — wheat and barley—but the soil had become impoverished to such an extent that grain could not profitably be produced except in alternate years. Before 1911, about 150 acres of land were under irrigation in and around the town of Orland from the unregulated flow of Stony Creek, which usually furnished a limited supply of water until the middle of June.

THE EAST PARK FEED CANAL, DIVERSION DAM AND HEADWORKS, ORLAND PROJECT.

A realization of the economic waste of such conditions led to the project's construction. It was begun in 1909 to include 14,000 acres, and in 1914 was extended to its present area.

The cost of the project, as completed, has been fixed at $55.00 per acre, repayable in 20 annual installments. Construction repayments began to accrue in 1916, and prior to 1924, eight installments of this charge, aggregating $14.96 per acre, had been paid in full on the due dates. As a result of a sixty per cent loss in crop production in 1924, when only one-fourth of the normal water supply was available on account of the abnormal deficiency in rainfall and the Stony Creek run-off, there was, for the first time in the history of the project, a delinquency in the payment of reclamation charges to the government.

Notwithstanding those adverse conditions, however, construction payments of more than one-half of the total amount due, together with a repayment of nearly three-fourths of the operation and maintenance charges for 1924 were made, and the outstanding amounts will be further reduced when returns from crops produced during 1925 are available.

The operation and maintenance charge on this project has varied from a maximum of $2.00 per acre in 1920 and 1921 to a minimum of $1.60 per acre—the rate established for the current year. The present installment of the construction charge amounts to $3.30 per acre per year. The earlier ones were at the rate of $1.10 and $2.20 per acre per year annually.

Statistical results of irrigation on the project appear in the table which accompanies this article.

With the completion of the storage works, water was first available for the entire season during 1911, when 2,663 acres were irrigated. With the exception of two years of abnormal drouth and consequent water supply shortage, there has been an expansion of the irrigated area each year until, at the present time, some 15,500 acres, or 75 per cent of the total project area, are being irrigate.

A STUDY of the reduction in crop production values in 1920 and 1924 as shown in this table (the result of water supply shortages) indicates that the present storage facilities of the project are not sufficient to furnish an adequate irrigation supply in years of less than normal rainfall. This has been recognized by both the Reclamation Bureau and the Orland water users and preliminary plans and estimates have been prepared and a tentative initial appropriation made by Congress towards the construction of a second reservoir on Stony Creek for the purpose of developing a storage holdover during years of normal rainfall and run-off for use in a possible succeeding drouth year.

While the cost of the contemplated work will exceed the original cost of the project, the Orland water users are willing to assume the increased charge on

VOL. I JULY, 1925 NO. 1

How and Where We Stand

CONSIDERABLE space has been given in this first issue of MODERN IRRIGATION to an exposition of the ideas and policies behind the magazine. It is important that any new enterprise of this kind should identify itself clearly and distinctly, in making its initial approach to those whom it expects to serve. It is unnecessary, of course, to add that this is a characteristic of the introductory number only. In future issues less attention will be given to MODERN IRRIGATION the magazine, and more—much more, as time goes on—to *Modern Irrigation* as an economic force, the foundation of agriculture in the west; and the underlying basis of western progress and western prosperity; at once a science, a great movement and a far-flung industry.

Some confusion, perhaps, may be occasioned in the minds of readers by the fact that MODERN IRRIGATION is published by the Petroleum World Publishing Company. In order that such confusion may be at once dispelled, it should be explained that this company has for many years been the publisher of PETROLEUM WORLD, the leading trade journal of the western oil industry, and takes its corporate name from that magazine. The company is not financially connected with, or subsidized by, any oil company or by any other organization or individual, and maintains a policy of independence and fairness toward all the elements of that industry, to which fact may be ascribed much of its success.

The company's decision to issue MODERN IRRIGATION, entirely apart from its other publications, as a magazine dealing exclusively with the interests of the irrigation industry, has come as a result of the recognition that this field presents unequalled opportunities for service. Already well organized for the publication of high-class industrial magazines, and located in the state where irrigation is most widely practised, it has been a logical development for the company to launch this new enterprise.

In so doing it has no axe to grind, no private theories to exploit, no propaganda to implant. Its one ideal is to create a magazine which will be a really representative organ of irrigation, and a constructive force for the dissemination of valuable information among irrigators and water users of all classes.

The Modern Journal

FROM its experience in the publication of industrial journals, the company has developed a very definite theory as to the proper function of such an organ. This theory is based on the premise that without the confidence of its readers such an endeavor is fruitless. Proceeding upon this basis, it is the purpose of MODERN IRRIGATION first to gain that confidence; and it sees no other way to acquire it than to deserve it honestly.

The usefulness of that man or that publication is destroyed which permits itself to be known as the spokesman of any one particular group or interest. From the time of its identification as a "special pleader" all of its utterances will be discounted, and they ought to be. It is because of this conviction that MODERN IRRIGATION enters upon its career without one entangling alliance, without one pledge made or promise given to any faction or interest, with only one expressed intention—to help to convey the truth about irrigation in its most useful form.

The ambition of the magazine is to become known as a reliable and authentic source of information, both general and technical, on all phases of irrigation and applied hydraulics. An especial effort will be made to present technical articles, which will be valued for their intensive interest to particular elements of the industry, along with general articles of an inclusive and extensive appeal to irrigators and technicians everywhere.

The Editorial Function

THERE was a time in the history of journalism when this sort of a policy was not the usual attitude of the editorial mind. In the "good old days" of Dana and Greeley, or perhaps as recently as the era of Marse Henry Watterson, the editorial function was that of a St. George, riding forth to slay

POINT *Of* VIEW

the dragons of ignorance or wilful opposition, armed with a pen that was tipped with triple brass. The editor was more than a mere collator and interpreter—he was a fierce and fiery tribune, cheered on by those who agreed with him, and riding rough-shod over the tender toes of all who did not. He sat in his editorial office, glaring at the world and condemning all his opponents to torture upon the pillory of his vitriolic vocabulary.

That policy, however, was better suited to a more primitive day and to a less complicated field of writing than to modern industrial journalism, in which no one—least of all a mere editor—may pose as the embodiment of all knowledge.

It is the conviction of MODERN IRRIGATION that the men who are actually working out the problems of the industry, thoughtfully, sincerely, and with an ideal of unselfish service, are the ones who are eminently qualified to supply the solution to its problems. The editor may better be a hard-working, prosaic interpreter of opinions and events than a picturesque Don Quixote astride the steed of dogmatic argument. And it is on this basis, and in line with these ideals, that the magazine is dedicated and presented to its readers.

A Titanic Task

BEWILDERING in magnitude is the field which MODERN IRRIGATION faces and the task which it has set for itself. The mere geography of the irrigation empire is an amazing thing—millions of acres of land, in hundreds of valleys, waiting but for the coming of water to spring into fruition; thousands of rivers, great and small, winding their way from the eternal snows and needing but the skill of the engineer and the judgment of the financier to transform them into fountains of wealth.

And the ramifications of the industry are so many! "How far back do you intend to take this matter of irrigation?" asked a notable figure in western agriculture, in speaking to the editor concerning the projected magazine. "Are you going back to the very beginning? If you are, you ought to include in your field those pressing problems of conservation and re-forestation which challenge every irrigationist who has the vision to comprehend them; and who considers not only the conditions of today, but their relation to tomorrow's water-supply."

Yes, it is an immense and a challenging field. Upon irrigation more depends, by far, than the solution of the problem of some few communities, that foresee, in the appropriation of water, the chance for their own expansion. The swelling population of America looks toward the west, and the west looks toward irrigation for the answer to the riddle of the future.

A Goal to Strive for

BUT it is easy enough to generalize and to voice eloquent platitudes about the subect. The real task of this publication will be to put form and substance into the vision, once caught, and bring forth an instrument of widespread service to each institution, and to the individual, in the irrigation field, in order that they may meet successfully the problems which confront them, and, at the same time, advance the welfare of the industry as a whole.

That is the goal which we will strive for. Too much, perhaps, to expect to accomplish between the covers of a magazine, issued but twelve times a year, and directed by mere human beings. But an ambition worthy of any one's effort. With the help of those who have pledged their co-operation to MODERN IRRIGATION, we face the task ahead with every confidence as to what the ultimate result will be.

Irrigation Needs Recognition

THE fact that no such journal as MODERN IRRIGATION has ever been launched, on a scale proportioned to the immense field of the industry, is but one further suggestion (of which there are so many for the thoughtful man to ponder) that irrigation is not recognized throughout the west at its true value. It seems strange, indeed, that this great force is so largely "taken for granted" by states which, without it, would be reduced to the status of semi-arid wastes upon which agriculture might be possible, but not profitable.

Charles C. Teague, probably the best known grower of citrus fruits in the west, said to the editor recently: "I could not afford to own and operate a farm that was not under irrigation." This is increasingly the attitude of practical horticulturists, who have learned the value of an adequate water supply in the school of stern experience.

And if this be true, what must be said of the state, or of the nation, that neglects or refuses to realize the paramount importance of irrigation and all things connected with it?

ANOTHER prominent irrigationist—F. A. Reid, president of the Salt River Valley (Arizona) Water Users' Association—was speaking recently of the general lack of appreciation of irrigation's importance. Mr. Reid said: "There are hundreds of thousands of people in the west, especially in the large cities, who go their way with no idea that irrigation means anything, at all, *to them;* and all the while their very livelihood depends upon the continuance and improvement of the irrigation systems of the semi-arid states."

The job of bringing home to the irrigator himself the magnitude of his responsibility, equipping him to meet that responsibility more fully, and of obtaining general recognition for the industry, can not be accomplished in one month, or one year, or by any one organization. But it must be done. MODERN IRRIGATION believes that it can help to do it.

The Snook O'Brien Model Farm

(*Continued from Page 20*)

Field No. 5, 10 Acres

MALAGA GRAPE VINEYARD

Average yield	6 Tons
Total yield	60 Tons
Selling price	$ 40.00

Modern Irrigation's Advisory Board

(*Continued from Page 15*)

Allan C. Hardison is president of the California Farm Bureau Federation and a member of the executive committee of the American Farm Bureau Federation. In addition to his prominence in farm-bureau work he is a successful horticulturist and an engineer of note. He is president of the Hardison Ranch Company, and officially identified with a large number of citrus associations and kindred organizations. He is president of the San Cayetano Mutual Water Company and vice-president of the Santa Paula Water Works, Thermal Belt Water Company, and Farmers' Irrigation Company, all of which are Ventura County (California) organizations. Mr. Hardison has rendered conspicuous service also in the field of agricultural education, having been a member of a commission appointed by former Governor Stephens of California to make a national survey of agricultural colleges with a view to improving methods of instruction in the college of agriculture of the University of California.

Four men have been invited to join and have accepted membership on the conservation group. They are George C. Pardee, Francis Cuttle, Paul G. Redington and M. B. Pratt.

Dr. George C. Pardee was an eminent surgical specialist before he was called to distinguished public service by the people of California. In 1891 he was chosen mayor of the city of Oakland, and was successively a regent of the state university and Governor of the state. His activities include important service in the interests of conservation; he was formerly a member of the National Conservation Commission, served as chairman of the California Conservation Commission, and is now chairman of the California State Forestry Commission. He is still active in business as president of the East Bay Municipal Utilities District at the age of sixty-eight, and interested in irrigation in all of its aspects. His home is in Oakland.

Francis Cuttle, for the past twenty-two years, has been president of the Riverside Water Company and prior to that, for sixteen years, was its superintendent. He has been president, also, of the Water Conservation Association, formed to conserve and utilize the waters of the Santa Ana River and its tributaries, since its inception in 1909, and has served as chairman of the Tri-Counties Reforestation Committees since it was organized by San Bernardino, Riverside and Orange counties in 1907 for a similar purpose, with a comprehensive plan of conservation, reclamation and flood-con-

THE IRRIGATION DIGEST

A Monthly Bulletin Board of Brief Facts and Events from the World-Wide Field

VALE, OREGON.—A survey of the Vale project has been begun, preliminary to the beginning of actual construction work, by R. J. Newell and T. A. Clark, government engineers of Boise, Idaho.

RIVERSIDE, CALIF.—The Riverside Water Company, by amendment of its by-laws, has become a mutual water company, and will supply water to its stockholders only.

SPOKANE, WASH.—The fourth annual convention of the Columbia Basin Irrigation League will be held here on July first, with Secretary Work and Commissioner Elwood Mead in attendance.

LAS VEGAS, NEVADA.—The Las Vegas Chamber of Commerce is fostering the formation of an irrigation district to take care of the rising water table in certain portions of the Las Vegas Valley. The water, which will be developed by means of drains, will be used on lands below Las Vegas.

WASHINGTON, D. C.—Estimates of the gross income from American agricultural products during the year 1924-25 indicate a material increase over the previous year. The current crop-year is expected to show a gross income of approximately twelve billion dollars, compared with $11,500,000,000 in 1923-24.

BUTTE VALLEY, CALIF.—The completion of the Butte Valley Irrigation District, comprising 28,000 acres of land, and bringing 10,000 miners' inches of water into Miess Lake from Butte Creek, Antelope Creek and Bear Lake, was celebrated with appropriate ceremonies on May 16th at a great community gathering near Macdoel.

SACRAMENTO, CALIF.—Among the bills passed by the California legislature and approved by Governor Richardson were Senate Bill 228, appropriating $94,125 for water surveys under the state division of Water Rights, and Assembly Bill 162, appropriating $20,000 for assisting the federal Interior Department in stream gauging in California.

KANSAS CITY, MO.—The Green-Beekman Construction Company, of this city, has been awarded a three-million-dollar irrigation and drainage contract on the Bardley project, near Phoenix, Arizona. The lands to be irrigated under this project are located nineteen miles to the northeast of Phoenix, and include 38,000 acres.

LOS ALAMOS, CALIF.—Ranchers of the Los Alamos, Santa Ynez, and Lompoc districts, Santa Barbara County, met with the Chamber of Commerce of Los Alamos recently to go into the final details of plans to irrigate 50,000 acres from three reservoirs, taking water from the Santa Ynez River. H. H. Henderson, engineer, is largely responsible for the plans of the understaking.

CARSON CITY, NEVADA.—Specifications and plans for the construction of an additional reservoir in the Lovelock Valley, Pershing County, Nevada, are in the course of preparation and will be submitted to a committee of citizens of Lovelock who have the work in charge. If consummated this project will provide 100,000 acre-feet of storage for use in the Lovelock Valley.

POCATELLO, IDAHO. — The great American Falls dam on the Snake River, twenty-five miles west of this city, will be formally dedicated with elaborate ceremonies on July 13th, with a crowd of participants expected to number more than 40,000 persons. The dam will impound 1,700,000 acre-feet of water as completed, with a potential capacity of 3,000,000 acre-feet, and will cover 61,000 acres of land.

MANTECA, CALIF.—By an overwhelming majority, voters of the South San Joaquin and Oakdale Irrigation Districts during May voted a bond issue of $2,200,000 for the construction of the Melones Dam, to be built on the Stanislaus River, nine miles below the town of Melones. The reservoir will be nine miles long and will store 110,000 acre-feet of water, to be used in irrigating 144,000 acres of additional land in both irrigation districts.

IMPERIAL, CALIF.—Peak flow of the Colorado River was attained June 12, for the year 1925, at 48,000 second feet, according to Chief Engineer Ray S. Carberry, of the Imperial Irrigation District. This flow represents a new low record. Flood peaks in former years have been: June 24, 1925, 65,800 second feet; June 8, 1923, 100,000 second feet; June 10, 1922, 115,000 second feet; June 28, 1921, 185,000 second feet; June 8, 1920, 190,000 second feet.

SANTA ANA, CALIF.—Current irrigation problems are being discussed in a series of meetings held in Orange County under the auspices of the Farm Bureau. Meetings are being held in seven different cities of the county, in various parts of the citrus growing area. Discussion of actual problems facing the ranchers who participate in the meetings will be featured, with an examination of soil borings and recommendations by specialists in charge.

PHOENIX, ARIZ.—The Salt River Valley Water Users' Association is rehabilitating the old power canal that parallels the southern shore of Roosevelt Lake. This canal, twenty miles in length, ends at the dam far above the present water level. With its "head" of 220 feet, it is estimated that much power may be added to the product of the hydroelectric works below the dam with loss of a relatively small amount of water. It cost $1,200,000 and furnished power for most of the dam construction work.

PHOENIX, ARIZ.—A series of experiments being performed by H. Stewart, Maricopa County Agent, C. A. Catlin, and B. J. Showers, to examine the effect of deep-well water in alkaline regions, may reveal some entirely new facts in relation to problems of water wells in alkali soils. The general theory that such wells bring alkali saturated water from deep strata and deposit the salts on the earth is being disputed. The experiments are expected to show that such is not the case, but that the deep wells actually remove alkali from the surface.

farmer to be able to turn on his own private rainfall whenever his fields require water. In this way sunshine and rain work together simultaneously and the result is shown in abundant crops.

Let the visitor look for himself upon conditions as they are developing today in California. As he passes through our great valleys he sees on all sides large farms being cut up into smaller tracts planted, variously, to fruit, vines, rice, alfalfa, grain, garden truck or some other crop that brings immediate and large returns to the farmer. If he looks farther he finds that the most important thing in connection with this intensified farming is the application of water to the land, and, going still one step farther in his investigation, that in a rapidly increasing percentage of instances the water is being pumped from wells and the pumping plants being driven by electric power.

In California, alone, it is estimated that on the ranches there are 35,500 electric motors in operation. These motors total approximately 483,965 horsepower. Eighty per cent of them are used for driving irrigation pumps. With such an unusually large consumption of current, judging by middle western and eastern standards, the electric light, heat and power companies can afford to sell power at a low cost and still make a profit. As a result, there is a general use of electricity for lighting and for barn power operations. In the interior valleys, where wood, coal or oil is not readily available, cooking to a large extent is done by electricity. The favorable climatic conditions of the far West encourage the use of electricity for this purpose and it is estimated that there are 10,000 electric ranges in use on California farms.

SO MUCH for the relation of electricity to modern agriculture as a general thing. But there is more to the subject in these enlightened times. There is cooperation, by which is meant cooperation between the power companies and the agriculturists themselves, the water users, the irrigation districts, the private irrigation enterprises and all others having to do with the development of the soil in the great valleys that stretch the length and breadth of California. That cooperation was much in evidence during the water shortage of last year, and it is safe to say that thousands of acres of fruit and farm lands which, but for skilful management in an emergency, would have gone short of the life giving sustenance that lies back of the electric pump, were saved from disaster by just such cooperation.

As a case in point, this was the situation in Placer County when it was found

How Electricity Serves the Irrigator

(*Continued from Page 17*)

that by July 1, 1924, the beginning of the fruit season, the stored water would be fifty per cent short of the average. Under such circumstances it would have been to the advantage of the electric service companies supplying that region to restrict the use of water at the beginning of the fruit season in order that its storage might be larger in the fall; but such early restriction would have run counter to the desires of the growers who wanted water to mature their fruit. Instead of pulling and hauling in different directions, officers of one of the larger power companies and representatives of the Placer County Water Users' Association, made up of land-owning fruit growers, sat down together to discuss the situation. The company's district manager put his cards on the table, so to speak. He told how much storage the company had and how much water would be needed to meet district and railroad demands which, by law, take precedence over all others. The growers checked the company's figures and an agreement was reached by which the association agreed to cooperate in an effort to avoid all possible waste, while the company, on its part, agreed to supply the growers with water as it was needed.

Both sides kept the faith and the result was that the irrigation period came and went with everybody satisfied. The agricultural situation was saved.

THE relation of electricity to agriculture is a problem engaging the attention of some of the greatest minds in the country. There is a national committee, which works under a competent agricultural engineer as director, whose chief task is to determine the maximum economic uses of electricity in agriculture. The work is organized on a state basis, being distributed among state committees similar in organization to the national committee whose personnel is made up of representatives from the American Farm Bureau Federation, the National Electric Light Association, the Power Farm Association, the American Association of Agricultural Engineers and the United States departments of Agriculture, Commerce, and Interior.

The state of California has participated in this movement for upwards of a year. The State Committee on the Relation of Electricity to Agriculture is headed by Professor L. J. Fletcher of the College of Agriculture, University of California, and its members include a number of power company representatives. The agricultural "load" is increasing every day. Take, for instance, the Pacific Gas and Electric Company's system; the record shows that in 1922 service was supplied to 12,500 agricultural consumers, cultivating a total area in excess of 450,000 acres, who consumed a total of 108,181,961 kilowatt hours, or 240 kilowatt hours per acre. The total agricultural connected load on this company's system at the end of the irrigating season in 1924 was 177,715 horse power, and the sales of agricultural power 135,306,000 kilowatt hours.

Modern Irrigation's Advisory Board

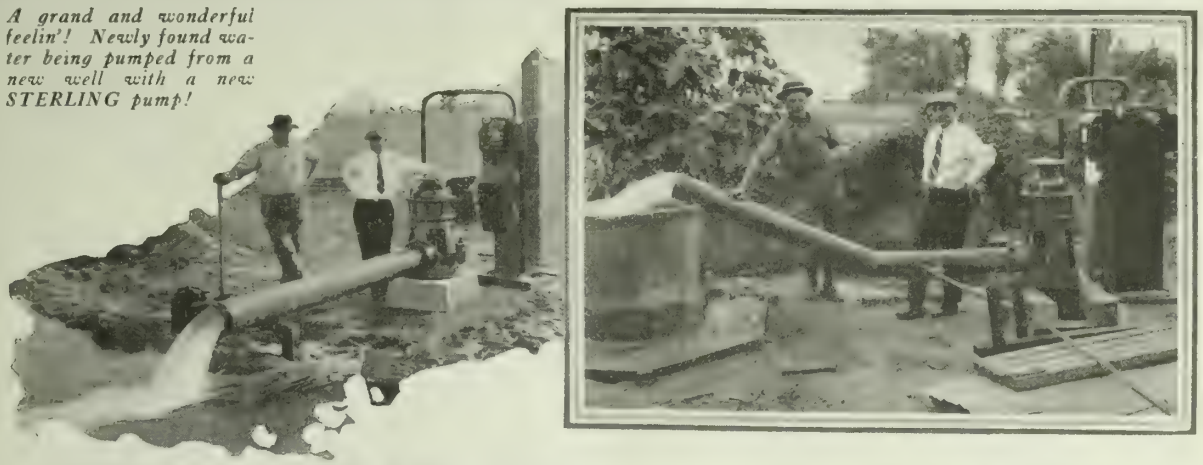
(*Continued from Page 24*)

trol of the Santa Ana River watershed. In these capacities, Mr. Cuttle has been actively engaged during all of the past thirty-eight years in the development, delivery and conservation of water. He was a member for five years of the California Conservation Commission, and is at present a member of the State Board of Forestry, taking an active interest in the conservation of forests and watershed cover. His residence is at Riverside, California.

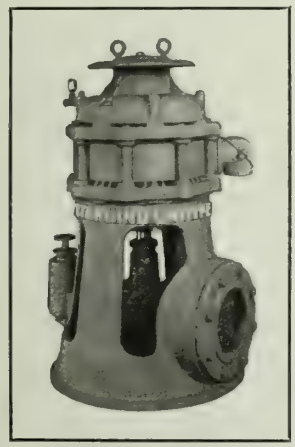
M. B. Pratt is State Forester of California. His special interest in irrigation is in its relation to the problems of forest-cover conservation. Mr. Pratt is president of the Association of State Foresters, and an acknowledged authority in his particular field. He completed his academic education at Yale University in 1905 with the degree of Master of Forestry and was connected with the United States Forest Service for nine years, resigning to enter state service in California. He served as assistant professor of forestry in the University of California for four years, subsequently becoming deputy state forester, and was appointed state forester in 1921. "I have long felt," declares Mr. Pratt, "that the industries dependent upon irrigation do not fully realize the significance of the co-relationship between watershed cover and water, and the effect upon continued prosperity of irrigated areas through the denudation of our mountain slopes."

Paul G. Redington is District Forester, United States Forest Service, with headquarters at San Francisco, and is also designated as the western representative of the Federal Power Commission to handle such water power activities as relate to the National forests. Mr. Redington is a graduate of Yale University, with the degree of Master of Forestry, and has served with the forest service in various capacities since his graduation, including that of inspector, supervisor and district forester in most of the National Forest states west of the Mississippi River.

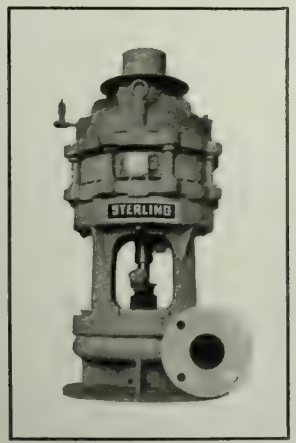
A grand and wonderful feelin'! Newly found water being pumped from a new well with a new STERLING pump!



STERLING *Original Unitype Drive* Deep Well Turbine Pumps



STERLING ELECTRIC DRIVE—THE ORIGINAL UNITYPE



STERLING VERTICAL CENTRIFUGAL PUMP (Patented)

RELIABLE DEALERS WANTED!

Member: Western Irrigation Equipment Association

OUR STERLING LINE *of* PUMPS *Consists of*

DEEP WELL TURBINES
Centrifugal Type

Sizes suitable for 3" diameter well up to and including 20" well. Both direct and belt drive. Send for bulletin No. 16-C.

HORIZONTAL PUMPS
Direct Connected and Belted

Sizes 1¼" to 10" inclusive. Send for Bulletin No. 14-C.

DOMESTIC WATER
Supply Systems

Surface and Deep Well Turbine Types. Horse power sizes ½, ¾, 1, 1½" and 2. Capacities 600 gallons per hour and up. Pressures 20 to 40 pounds. Send for Bulletin No. 17-C.

VERTICAL PUMPS
Direct Connected and Belt Drive

Sizes 1" to 6" inclusive. Send for Bulletin No. 20-C. The motor on this pump is interchangeable with the motor used on the Deep Well Turbine Drive. In purchasing this pump you have the advantage of being able to use the motor on your future Deep Well Turbine Pump. **Think it over!**

GAS ENGINE PUMPS
Direct Drive and Centrifugal Type

Capacity 20 to 80 gallons per minute. 25 to 75 foot lift. Send for Bulletin No. 19-C.

STERLING *Pumps*

IRRIGATION MANAGEMENT

SOME PROBLEMS OF A MUTUAL WATER COMPANY

By RICHARD BARD

President, Zone No. 1 Mutual Water Company, Ventura County, California

IRRIGATION is the artificial application of moisture to the soil. In Southern California, the development of every specialized crop, such as oranges, lemons and walnuts, has been dependent upon the successful development of water for irrigation purposes. Without irrigation these industries would shortly perish, the orchards die or the production fall off to the point where the return would be less than the expense of raising the crop.

The entire citrus and walnut industry has succeeded because the orchardist is not dependent upon the natural rainfall but can supplement nature's supply with moisture artificially applied at times and in amounts exactly suited to the needs of each particular orchard. Consequently, in California, this need of water has given rise to the formation of irrigation districts, public utility companies, mutual water companies and private systems on a scale perhaps the largest and most highly developed of any irrigation system in the world.

In some regions of California water is very difficult to develop; while in others, artesian wells can be put down at small expense and operated at almost no cost.

THE cost of water is usually based upon the head delivered for 24 hours. This ranges from five cents per miner's inch for 24 hours in large districts where open ditches are used, and where the pumping head is nominal, or else gravity flow, to $1.00 per miners inch for 24 hours in districts where the supply is scarce and the pumping lift is tremendous; as, for instance, 700 or 1000 feet. It can readily be seen that the more costly the water, the greater the necessity for measuring carefully the amount of water delivered.

MAIN PUMPING PLANT OF ZONE NO. 1 MUTUAL WATER COMPANY, SHOWING INSTALLATION OF BYRON JACKSON PUMPS DIRECT-CONNECTED TO WESTINGHOUSE MOTORS.

Some companies rely entirely upon guess work to determine the amount of water their users consume and, in some instances, have no standard charge but pro-rate the expense among their stockholders at the end of the year by levying assessments to cover all charges. Public utility water companies are, of course, compelled to submit a rate determined by the Railroad Commission. But Mutual Water Companies, with which the writer is more familiar, are organized with the idea in mind to deliver water to their stockholders at cost. The cost element is variously determined by different companies, but it is pretty well established that in figuring cost of delivery the following items should be included: power, repairs to lines, machinery, wages of superintendent and linemen, supplies, small tools, office help, officers' salary (if any), stationery and supplies and all other expenses incident to the delivery of the water.

In addition to the above should be added depreciation of system, machinery and equipment, interest on borrowed money, and amortization of funded debt. The latter charges are seldom calculated in fixing water rates, but they ought to be taken into account and proper reserves set up to allow for depreciation and to build up funds with which to retire indebtedness. It is customary, with most companies, to wait until a new line has to be in stalled or new machinery purchased and then levy a special assessment to cover this outlay. But this is unwise practice and throws a sudden burden upon the stockholders. The only proper way to handle betterments, renewals, and funded debt, is to provide for the same by levying a special charge each year against all the stockholders, equally proportioned upon the basis of stock ownership or acreage involved. In this way actual cash reserves are created, so that in case renewals must be made, or indebtedness must be met, there is cash on hand for the purpose and no special assessment is necessary.

In the particular irrigation company with which the writer is concerned, we have an area of some 4500 acres

18-INCH PUMP WITH UNDERGROUND DISCHARGE, INSTALLED FOR CITIZENS LAND & WATER CO., BLOOMINGTON, CAL., 125 H. P. MOTOR AT 725 R. P. M.

Citizens Land & Water Co.,
Bloomington, Cal.

Pacific Pump Works:
Gentlemen:

I have just been going over my power bills of this and the past season and the results are very gratifying.

We now have five of your pumps and we are very well pleased with them. The added efficiency you gave us has taken care of the great depth we have to pump this year. Your fair treatment and good equipment deserves the support of every user, and you may use us at any time, —our records are open to you.

Wishing you success, I remain,

Yours truly,

J. F. YOUNG, Supt.

STANDARD SPECIFICATIONS

Bronze Impellers in all Pumps—Heavy Column Pipe with "Butt-Joints" and lathe cut threads —Cumberland Shafting, always oversize, enclosed in housing with Bronze Bearings every six feet. Spider Guides every twelve feet—Gravity Feed Lubrication—Power Heads, all Full Floating—and Interchangeable belt or motor drive without changing head shafts.

Capacities 100 to 5000 Gallons per minute. Wells 8-inch and larger.

under the system, divided into two different areas or zones, based upon elevation. The first zone comprises about 3,000 acres, the average pumping lift being 200 feet, and the second zone 1,500 acres, with an average pumping lift of 400 feet.

Our charge for water in the first zone is thirty cents per miner's inch for twenty-four hours, with a yearly depreciation charge of $1.20 per acre, and our charge for water in the second zone is fifty cents per miner's inch for twenty-four hours, with a depreciation charge of $1.80 per acre. This system has now operated two years and we find that our charges for water are ample to pay all expenses, with every likelihood that we will be able to reduce the rates as our system is used more.

When we started the construction of the system we considered carefully the matter of measuring devices. There was no question as to the advantage of installing some kind of device, but the particular make and unit of measurement was a matter of choice. After much investigation we determined upon the Sparling meter as being the most practical field meter for our particular needs. We now have nearly 100 of these meters installed and operating. They have given very satisfactory service and are the basis and final court of appeal in all controversies regarding the amount of water delivered to users.

THERE is no question in our minds that it is absolutely necessary to have measuring devices installed in any modern system. If one relied entirely upon the zanjero to estimate the flow of water and the number of hours it flowed, there would arise constant controversies on the part of the farmers as to the actual amount of water received. It is impossible to regulate the flow through a pipe-line so that it will remain constant for a given length of time. This being the case, the farmer would always have occasion to doubt whether he got the amount of water paid for and, consequently, a feeling of dissatisfaction would arise in his mind and a belief that he was being treated unfairly and on a different basis than his neighbor; all of which makes smooth running and cooperation impossible—the essential need of every mutual company.

Therefore if, at a very nominal expense, meters can be installed which will make the calculation of water deliveries automatic and beyond dispute, it would certainly pay every company and in fact every individual user to adopt measuring devices for its or his particular system.

Not only is it valuable to the company to know exactly how much water it is delivering to each user, but it is also extremely valuable to each individual farmer or grower to know exactly how much water he is putting on the land. Without such measuring devices, the farmer is working blindly and often wastes his water; or else he fails to put on enough water, with the result that he loses the benefit of irrigation altogether. Any orchardist ought to know how many acre-inches of water his ground has received during the year, in order intelligently to care for his trees.

There are numerous units of measurement of water, such as gallons; cubic feet; second feet; miner inch hours; acre feet and otherwise. For municipal use or domestic use, the unit of gallons or cubic feet is used almost exclusively. In large irrigation districts, particularly in alfalfa regions, the unit is in second feet; but in systems involving orchards the unit usually is in cubic feet or miner's inch hours. We adopted the latter unit as it seemed the simplest and most easy to convert into terms of acre inches. A miner's inch hour is the amount of water which results from the flow of one miner's inch of water for one hour, or in terms of gallons (using 9 gallons per minute for 1 miner's inch) 540 gallons. Thus if a farmer receives a head of 100 miner's inches for twenty-four hours, he receives 2400 M. I. H. Converted into gallons this equals 1,296,000 gallons. As there are 325,850 gallons in each acre foot of water, a flow of 100 M. I. for twenty-four hours is equivalent to approximately four acre feet. Or, in other words, 600 M. I. H. equals one acre foot and 50 M. I. H. equals 1 acre inch.

Therefore if the farmer wants to know how many acre inches he has put on his land he goes to the meter, reads the dial, subtracts the reading from the former reading and divides the difference by 50. This gives him a quick method of calculating his application of moisture to the land.

THE amount of water applied to the land varies with the crop and moisture conditions. Lemons need water every month of the year, walnuts three or four applications, beans one or two applications. Sometimes as high as four acre feet per acre is applied per year, but the average amount used by orchardists in Southern California will run from fifteen inches to two feet per acre.

Last year our company delivered to its stockholders an average of twelve acre inches to each acre irrigated at a cost to the user of $7.50 per acre. The average return to the user in lima beans was 1450 pounds per acre, or, in money, a gross return of $163.00 per acre.

In conclusion let me say that irrigation is the only insurance a farmer or orchardist in Southern California has against dry years. Furthermore, the proper application of water to the soil is the problem which every farmer or orchardist must work out for his own particular needs.

This cannot be done effectively unless he has some sure way of finding out the amount of water he is putting on his land; hence, one of the most important features in any irrigation project is the installation of accurate, easily installed, well built measuring devices. Without them the farmer and the company are lost; with them, intelligent irrigation is made not only possible, but simple.

One Successful Reclamation Project—Orland

(*Continued from Page 21*)

any reasonable terms of repayment available under the Reclamation Law, so that with the completion of the proposed work and the agricultural results from irrigation heretofore obtained on the Orland project, its success in the future is definitely assured.

The project area, originally consisting of a few large holdings and supporting a population of not to exceed 200 in number, has been broken up through the agency of government irrigation to the extent that, even in an adverse drouth year, such as 1924, nearly 700 farms with

SUMMARY OF RESULTS OF IRRIGATION ON ORLAND PROJECT

Year	Acres Irrigated	Crop Value		Land Investment	No. of Farms	Population of Farms
		Total	Per Acre			
1911	2,663	$ 60,218	$24.80	$ 800,000	188	640
1912	4,230	112,924	29.24	1,358,500	211	645
1913	6,616	203,949	34.07	1,709,035	246	896
1914	7,354	176,331	26.99	2,073,965	296	1,333
1915	8,928	220,422	31.81	2,100,300	351	1,258
1916	9,357	342,399	48.83	2,538,342	384	1,260

1918	14,764	709,172	58.73	3,648,100	593	1,689
1919	15,203	892,259	71.90	4,894,645	600	1,768
1920	13,872	549,698	49.80	5,419,350	644	1,844
1921	14,697	495,810	43.32	5,557,810	663	1,892
1922	15,119	565,556	47.92	6,123,000	693	1,909
1923	15,500	675,967	54.40	6,235,950	703	1,945
1924	11,962	224,952	22.57	6,131,550	673	1,750

a population of 1,750 were being operated and irrigated. During the same interval, the population of Orland increased four-fold.

The water supply for the Orland project is derived from Stony Creek, a tributary of the Sacramento River, originating in the Coast Range mountains. The irrigation plan provides for storage in a reservoir of 51,000 acre-feet capacity, controlled by East Park Dam on Little Stony Creek and a feed canal, seven miles in length, connecting the storage basin with main Stony Creek. For the irrigation of project lands, water is diverted from Stony Creek at two points into the South and North Canals by means of low diversion weirs. The natural flow of the creek is utilized for irrigation requirements during the early months of the season and is later supplemented by storage.

The stored water is conveyed from East Park reservoir in the natural creek channel some 40 miles before being diverted into the distribution system, comprising 138 miles of canals and laterals, 90 miles of which are concrete lined.

The soil at Orland consists of alluvial deposits from Stony Creek with an admixture of wash from an adjacent, more elevated area. The varieties are gravelly loam, clay and sediment loam, all deep and very productive. The general slope of lands within the project is about 15 feet to the mile, affording excellent surface drainage. The subsurface drainage is equally as good, so that after 14 years of irrigation on the project no drainage problems, originating from a general rising of ground water levels, have occurred.

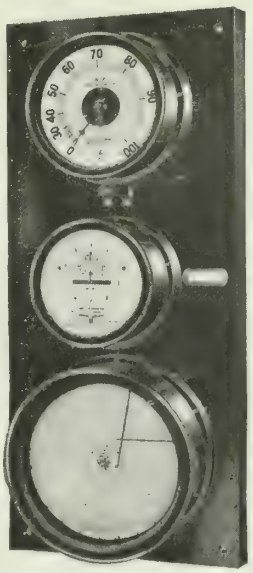
The average elevation of the irrigable area of the project is 250 feet above the sea level, the variation being from 180 to 320 feet. The mean annual temperature at Orland, as derived from Weather Bureau records extending over some 40 years, is 64 degrees. The normal rainfall is 18 inches per season, which occurs usually between November 1 and March 1. The irrigation season normally extends from April 1 to October 1, with some irrigation of citrus and olives in October and November.

All land in the Orland project is in private ownership. Land was purchased by new-comers from the original owners at prices varying from $75 to $125 per acre for unimproved property and from $300 to $1,200 per acre for improved property.

The limit of ownership has been established at 40 acres, except that original subscribers (and their successors in interest) to stock in the Orland Unit Water Users' Association are qualified to hold an area not in excess of 160 acres.

Advantages of Electrically Operated Water Meters for Irrigation Purposes

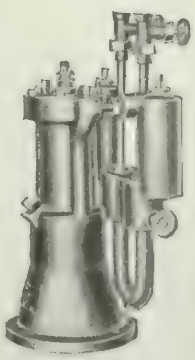
ELECTRICAL operation means flexibility in water meters, as in all electrical appliances. The meter body may be installed in the most inaccessible places, while the indicating, totalizing and recording instruments can be located in the most convenient places, as engine rooms or in the office.



This is made possible because the meter body is electrically wired to the reading instruments, thereby eliminating the necessity of having the meter body and reading instrument close to each other.

This electrical operation insures absolute accuracy. There are no errors due to friction resulting from mechanical appliances as floats, cams, levers, glass and stuffing boxes.

In deciding on water meters for irrigation purposes, it is well to keep in mind the following points that are found in Republic Water Meters. They result directly from the use of the thin plate orifice and electrical operation.



1. **Insures accuracy.**
2. **Easy to install—orifice plate may be installed between flanges.**
3. **Low Cost.**
4. **Does not cause noticeable pressure drop.**
5. **Does not clog, rust or wear out.**

HYDRAULIC ENGINEERING

Dealing with the Problems of the Irrigation Operating and Consulting Engineer

HINTS ON THE USE OF CONCRETE IN IRRIGATION

By J. E. JELLICK

District Engineer, Portland Cement Association, Los Angeles

CONCRETE pipe systems have been extensively used for irrigating land in the western states for the past thirty years. Investigations conducted by the United States Department of Agriculture, and by agricultural colleges in irrigated regions, show that vast areas of highly productive land are being ruined because of inefficient irrigation methods. This loss of productive capacity in many cases can be practically eliminated by carrying the water required for irrigation in modern pipe systems.

In 1921 the United States Department of Agriculture published a bulletin entitled "The Use of Concrete Pipe in Irrigation", prepared under the direction of Dr. Samuel Fortier, a recognized authority on irrigation. The importance of efficient irrigation systems is emphasized in the following statements by Dr. Fortier, quoted from that bulletin:

"In recent years, owing to the rapid increase in the value of soil products, intensively farmed land under irrigation systems has risen in many cases to double its pre-war value. This great advance in the value of irrigated land has placed a premium on water, and a widespread effort is being made to convey, distribute and use the appropriated waters in such a way as to incur the least possible loss. Every gallon of water wasted by seepage and absorption in porous earthen channels or in careless use on the land robs the farmer of so much profit; whereas, every gallon saved protects fertile soil from water-logging and results in larger yields and profits to the grower.

AN experience covering a period of over a quarter of a century on the Pacific Coast, and more especially in California, has demonstrated that large quantities of water can be saved by the substitution of pipe for earthen ditches. The results of a large number of measurements made by the irrigation division of this bureau show that the transmission losses in earthen channels vary from 10 to 60 per cent and average fully 35 per cent of the quantity of water admitted through the intake. When pipe are substituted for earthen channels, the loss of water in conveyance is usually negligible.

"The use of pipe for the carriage of water and of pipe systems for its distribution to farmers not only prevents loss of water, but affords better facilities for its control, distribution and delivery. Irrigating land by means of open channels in earth is a laborious and unpleasant task, wasteful of water, time and effort. On the contrary it can be rendered comparatively easy and pleasant if the proper equipment is provided in the way of pipe, pipe systems with proper gates, turnouts and other fixtures. The interest on the cost of such betterments for highly profitable crops is more than likely to be amply compensated by the water and labor saved and a more uniform moistening of the soil."

Efficient methods of irrigating land are being developed at the University of California Experimental Farm, Davis, California, under the direction of Professor S. H. Beckett, an authority on irrigation matters. The recommendations of Professor Beckett are contained in booklets published by the Portland Cement Association, and are available upon request.

The following valuable suggestions on laying concrete pipe are quoted from the government bulletin "The Use of Concrete Pipe in Irrigation", previously mentioned:

"Concrete pipe should be laid deep enough in the trench so as to reduce the range of temperature and to be safe from injury against plows, subsoilers or other farm implements. There should be at least 12 inches of earth over the top of all kinds of pipe, and high pressure pipe should have a top covering of at least 18 inches. Temperature changes in the shell of the pipe are greatly reduced when the pipe is buried deeply, and less trouble is experienced from expansion and contraction. The moisture content within the shell of the pipe is likewise kept more uniform than where the upper half is laid near the surface of the ground.

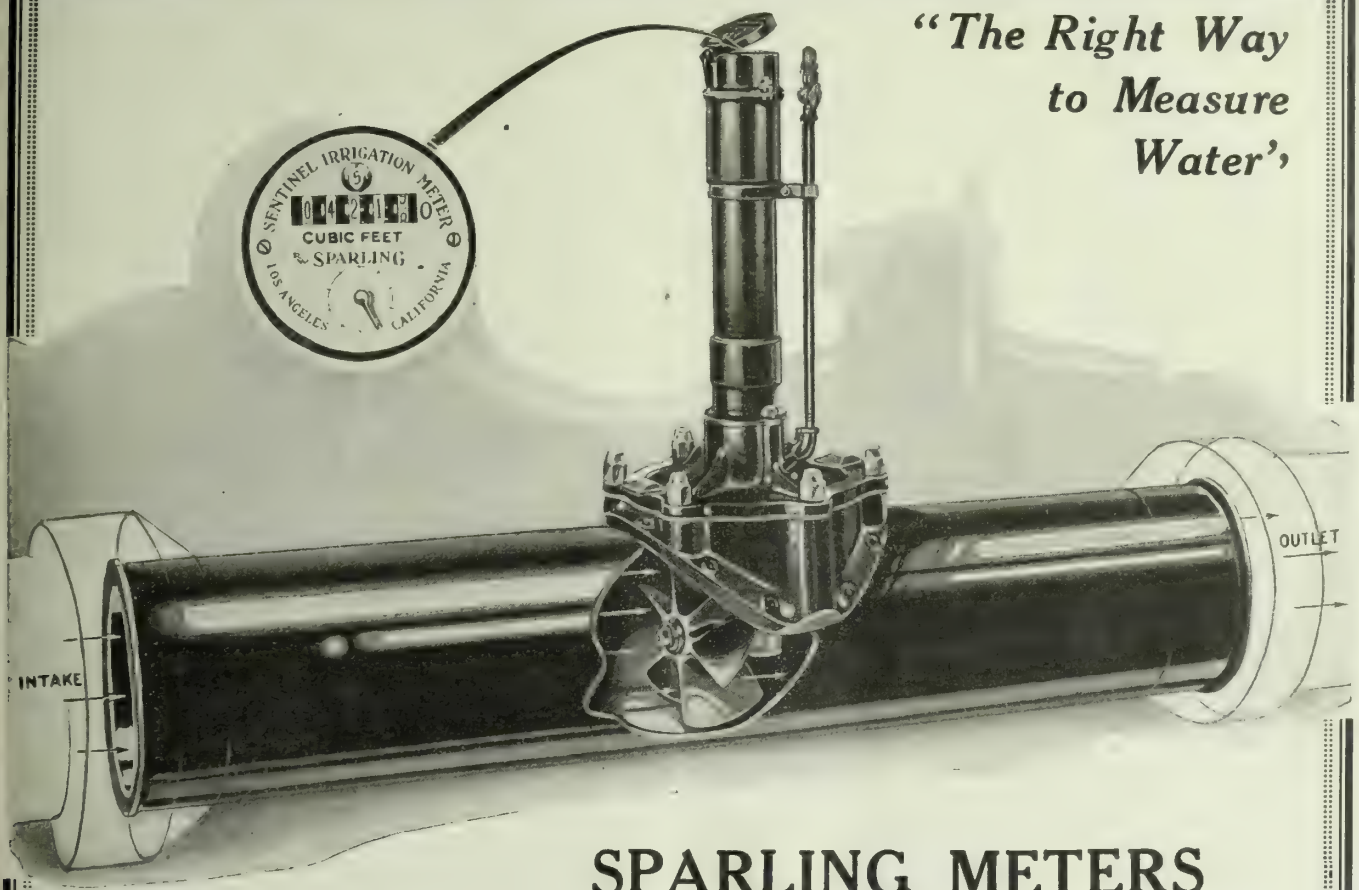
"Most experienced pipe layers lay small sizes of pipe by standing the joint to be paid on end and filling the groove end with mortar. The pipe is then firmly pressed against the tongue end of the pipe that is already laid in the ground, care being taken to get a good bond of mortar between the ends of the

THE WASTEWAY PIPE SET AT AN ANGLE IS DESIGNED TO PREVENT AIR TROUBLES.

WHERE A CONCRETE PIPE SYSTEM WATERS THE HILL TOPS AS WELL AS THE VALLEY.

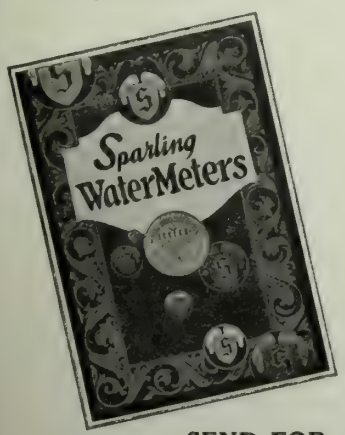
THIS EXETER (CALIF.) VINEYARD GETS ITS WATER THROUGH A CONCRETE SYSTEM.

"The Right Way to Measure Water"



SPARLING METERS ASSURE ACCURATE MEASUREMENT

Water is too valuable to be handled carelessly and user and producer should be protected by the impartial certainty of meter measurement. The Sparling Meter provides an accurate record of the EXACT amount of water passing through it—eliminates guess work and disputes, and assures a "square deal" to all.



SEND FOR THIS BOOK!

Completely illustrated with valuable data and charts together with information about the efficiency of

THE SPARLING METER

Four Big Features of the Sparling

1—Registers the volume of water in whatever unit may be desired.
2—Is simple to install and moderate in cost.
3—Applicable to either open flow or pressure conditions.
4—Tamper proof, yet accessible for repairs.

Sparling Meters are daily demonstrating their efficiency for large users in Agricultural Projects, Municipal Plants and in Industrial Enterprises.

Let us help you solve your particular water problems.

R. W. SPARLING

WATER MEASURING EQUIPMENT

945-951 NORTH MAIN STREET

LOS ANGELES

For Detailed Listings, Branch Offices, Etc., See the Buyers' Guide to Leading Supply Sources—Pages 55-56

pipe. The mortar is smoothed off with a trowel on the outside and the inside brushed smooth with a long-handled brush. The ends of the pipe are always wetted with a brush before applying the mortar.

"After the trench is dug and the pipe to be laid strung along the side of it, one expert pipe layer, with two helpers, will sometimes lay as much as 1,200 feet of 8 to 12-inch pipe in a day, but 800 feet is a good day's work for an average crew. Four men are usually needed to lay pipe from 14 to 18 inches in diameter and will average 300 to 500 feet of this size in a day. Five to seven men will lay from 300 to 500 feet of 24-inch pipe in a day.

FAVORABLE conditions for laying concrete pipe depend upon temperature, moisture in the pipe when laid, and moisture in the ground. Pipe laid in winter, when the ground is moist from rains, seldom gives trouble, especially if the pipe is kept continually full of water after being laid. Pipe laid in sandy soil, when the ground is hot and dry, is almost certain to develop contraction cracks unless water is turned in promptly. If it is necessary to lay pipe in hot, sandy soil, the trench should be deep and the backfill kept moist until water can be turned in. As bands and joints sets very rapidly, pipe can often be filled with water 24 hours after laying. Heavier soil containing moisture will protect the pipe from drying out. If the pipe is dry when laid, and the soil is dry and warm, there will probably be little change in the length of the pipe until it is filled with water, but when the pipe is thoroughly soaked there is likely to be considerable expansion."

Irrespective of its diameter, pipe should show no leakage under a hydrostatic pressure of 15 pounds per square inch, maintained for a period of five minutes. This pressure is equivalent to a head of approximately 35 feet. Moisture merely penetrating the shell of the pipe and adhering to its surface should not be considered leakage.

The outer surface of pipe made with concrete of correct semi-dry consistency should have distinct web-like markings. This indicates that the proper amount of water has been used to give maximum strength and minimum absorption.

When struck with a hammer a properly made concrete pipe will produce a clear ringing, metallic sound.

It is not intended to cover all phases of the subject here, as an article of more or less general nature is all that space permits of, and reference is again made to the publications of the Portland Cement Association which are available to anyone upon request.

Southern California Water Problems

(*Continued from Page 18*)

Mountains are conspicuous, while in the region of the San Gabriel River they are practically absent.

A water supply anywhere near the average of a cycle requires the storage of hundreds of thousands of acre feet, which may have to be carried over for several years.

There is a further conspicuous irregularity in the seasonal run-off of the years of any one period. The dry period of 1893-1904 produced in the San Gabriel River and tributaries the following run-off:

A maximum seasonal of.....177,000 acre feet
A minimum seasonal of..... 9,700 acre feet
And an average of..... 61,600 acre feet

It will, therefore, require large storage to maintain the average of a dry period. No surface reservoirs are available to store such volumes of water. However, a kind Providence has given us large groundwater basins, arranged in series so that practically a full utilization of the local water supply is possible.

The records of streamflow in Southern California go back only about thirty years, those of rainfall generally about fifty years and for the city of San Diego, seventy-five years.

The investigations of the Carnegie Institute indicate periods during which the rainfall fell below our present dry period records by 30 per cent.

Computations of safe yield of large watersheds like that of the Valley of Southern California, and upon which large territories depend for their continued development, should, therefore, be discounted by an additional safety factor.

THE Valleys and Coastal Plains within the territory here considered are sunken basins of depths of 1,000 feet or more reaching, in most instances, considerably below sea level. They are filled with irregular deposits of sand, gravel and clay, alluvial deposits of the streams issuing from ranges of crystalline formation and are capale of absorbing large volumes of water. The streams crossing the valleys and the rainfall on the valley floor produce seepage which ultimately reaches the ground water table and thence gradually moves to the ocean. Most of the valleys have more or less constricted outlets, like the San Fernando Valley, at Glendale; San Fernando Valley, at Glendale; San Gabriel Valley, at Whittier Narrows; the Santa Ana Valley, at Rincon near Corona; the Coastal Plains, at Palms; on both sides of Signal Hill; and between Newport and Alamitos Beach. The outlets of the Coastal Plains are gaps cut into the oil anticline which extends from Newport Beach to Huntington Beach, Signal Hill, Athens and Beverly Hills.

In the upper valleys the ground waters, backed up by these constrictions, rise to the surface in the stream channels and produce rising streams, such as the Los Angeles River, at Griffith Park, which has a flow of 45 to 80 sec. feet; the San Gabriel River, at Whittier Narrows, flowing 60 to 120 sec. feet; and the Santa Ana River, at Rincon, flowing 50 to 150 sec. feet.

In the Coastal Plains the ground waters do not drain into channels but rise generally to the surface of the ground and produce moist areas from which the water evaporates. Cased wells sunk in these moist areas have an artesian flow.

All these basins are of colossal dimensions embracing, in some instances, hundreds of square miles and they are, therefore, capable of storing and regulating enormous quantities of water which no surface reservoir could accomplish.

The effect of periodical fluctuations of water supply on the groundwater levels in apparent from well observations extending, in a few instances, over a period of about 30 years and, for large numbers of wells, over 20 years. Water levels rise and fall in sympathy with precipitation and streamflow. As all basins are under a more or less uniform natural draft, either by percolation at the outlet or by water rising to the surface, the effect of a subnormal seasonal wetness will produce a deficient recharge as compared with the natural draft and vice versa. The cumulative effect over a dry period is, therefore, a gradual recession of the waterplane, reaching its low water mark at the end of the dry period. With a wet period, gradual recharge sets in until at the end of the same, peak conditions are reached. These groundwater basins, individually, effect an imperfect natural cyclic storage to the extent of their recharge.

The development of horticultural farming in Southern California (with the exception of the San Fernando Valley) and the remarkable crop yields of this semi-arid country over wet and dry periods alike have been made possible by the available underground storage.

In these ground water basins Nature has indicated how storage of the flood-waste and of a supplementary supply must be taken care of if this country shall be fully developed and be independent of the periodical fluctuations of local water supply.

LOS ANGELES COUNTY has a Flood Control but no Conservation organization. Its flood control plans provide for a system of surface detention reservoirs, the largest one being that proposed for San Gabriel Canyon with a capacity of 240,000 acre feet at an estimated cost of $25,000,000.

The requisite capacity of these reservoirs for flood control purposes depends not only on the flood flow but also upon the magnitude of the efflux during floods and is, therefore, directly related to the question of conservation.

The County, however, has no concerted plans for the conservation of floodwaste. Within the metropolitan area outside the city, there are a great number of water supply organizations, most of which, for growth in the immediate future, depend upon conservation. It is felt that unless their interests are consolidated and co-ordinated with the flood control plans, no systematic utilization of the flood waste can be made.

In the Santa Ana River watershed conservation by spreading flood waste on the debris cones is practiced on a large scale, the principal organizations being the Conservation Association operating on the Santa Ana Cone and the Pomona Valley Protective Association, on San Antonio Creek. Direct diversions are made, without detention storage, as soon after peaks as the water is reasonably free from silt and danger of breaks is past. The ultimate consummation of conservation must be handled in connection with flood control detention reservoirs, both for engineering and for economic reasons.

The plans of Mr. William Mulholholland, Chief of the Lost Angeles City Water Department, provide for the diversion of 1,500 sec. feet from the river for domestic use of the cities in the Valley of Southern California. The length of the aqueduct is approximately 250 miles, involving a pumping lift of about 1,400 feet. Large storage will be required at this end. Generally speaking, surface storage sites are scarce and they have to be used at times for flood control purposes. Underground storage is available and will likely be utilized, with the underground storage of Owens River Aqueduct water in San Fernando Basin as a precedent. About 150,000 acre feet of water has been stored in that Basin underground as seepage from irrigation, with the effect of increasing the dry period flow of the Los Angeles River by 20 sec. feet. Supplementary as is this Colorado River supply, its use must be co-ordinated to the local supply, so that the rational utilization of all water sources resolves itself into one problem within each principal watershed.

A Great Western Irrigation Meter

will solve your measurement problems

It is on the job day and night. It is not effected by silt or trash. Meter is geared for orifice of any size (1-10 sq. ft. to 100 sq. ft.)

WHO'S *WHO* AND WHO'S *WHERE*

IN IRRIGATION AND RECLAMATION

Personal Notes and Impersonal Observations About Men You Know

Everett M. Paul, formerly director of the sixth agricultural district, Los Angeles, California, has resigned his state position to become manager of the Sun Maid Raisin Company. His home will be in Fresno.

The Governor of Oregon and the Secretary of the Interior have recently designated W. A. Delzell, of Salem, Oregon, to serve on the Board of Survey and Adjustments in connection with the review of reclamation matters in Oregon.

Frank Evans, of Salt Lake City, Utah, has been named General Marketing Counsel and Secretary of the American Farm Bureau Federation, by its Executive Committee. Mr. Evans has served for three years as attorney for the Utah State Farm Bureau, and has been a director of the National Federation for the same length of time.

B. F. Williams of Kaufman has been appointed state reclamation engineer of Texas succeeding Arthur A. Stiles. Mr. Williams has been engaged in general engineering practice for the last fifteen years. Mr. Williams says it shall be the policy of his department to provide the people of the state with adequate and accurate engineering data on economical and safe flood control.

Colonel William Kelly, Corps of Engineers, U. S. Army, who has served as chief engineer of the Federal Power Commission since September 1, 1920, has been granted an extended leave of absence by the War Department. The vacancy thus created has been filled by the designation of Major Glen E. Edgerton, Corps of Engineers, to be chief engineer.

Knowles Ryerson, Farm Adviser of Los Angeles County, California, has left on an extended leave of absence for Haiti, where he will have charge of the horticultural work at the new experiment station and agricultural school being established there under the direction of the United States. M. B. Rounds, assistant farm adviser, has been appointed to his place during his absence.

Raymond F. Walters became chief engineer of the United States Bureau of Reclamation on May 1, after serving with the bureau since 1903. Since the resignation of former Chief Engineer Weymouth last year, Mr. Walter has been acting chief and on May 1 became the official head of the engineering department. His headquarters are at Denver, Colorado, and he is a graduate of the Colorado Agricultural College.

Louis C. Hill of Los Angeles, Major General W. C. Langfitt, and Fred A. Noetzli of San Francisco have been named members of the advisory board of engineers which will be in responsible charge of the construction of the Coolidge dam and the San Carlos project in Arizona. The personnel of the advisory board has been approved by the Commissioner of Indian Affairs at Washington, D. C.

A party consisting of C. E. Grunsky, Jr., engineer of San Francisco; Vern Freeman, engineer for the Santa Clara River Protective Association; A. C. Hardison, president of the California Farm Bureau Federation, and Harry Valentine, district forest ranger, spent several days during June in the back country of Ventura County with a view to determining the extent of the Santa Clara watershed. They are making particular note of possible dam sites.

Charles H. Fitch, of the Washington office of the United States Bureau of Reclamation, retired recently from professional labors at the age of seventy years. His activity in government service covered a period of more than fifty years. He was attached to the Bureau of Reclamation from the time of its organization, in 1902, until his retirement. From 1911 to 1916 he was project engineer of the Salt River Valley project, Arizona.

Robert W. Hodgson, associate professor of subtropical horticulture in the University of California, and formerly farm adviser in Los Angeles County, is conducting one of the principal classes in the summer school which will be in session from June 27 to August 8 at the Citrus Experiment School, Riverside, California. The course will cover citrus culture from many angles, including some very practical work in irrigation problems.

Succeeding Frank T. Payne, acting commissioner ad interim, W. J. Everett has been appointed state commissioner of conservation in Louisiana. He was formerly private secretary to Governor Fuqua, of that state. His acquaintance with reclamation activities in Louisiana is extensive, and he was for some time a professor in the Louisiana Polytechnic Institute at Runston; later engaging in newspaper work in various parts of the state.

F. E. Weymouth, formerly chief engineer in the United States Bureau of Reclamation, recently resigned that office to accept private employment. Mr. Weymouth had been connected with the reclamation service since 1902. His career has included a great variety of significant accomplishments in engineering work, both in this and other countries, including the construction of the Arrowrock Dam, in Idaho, the highest structure of the kind in the world.

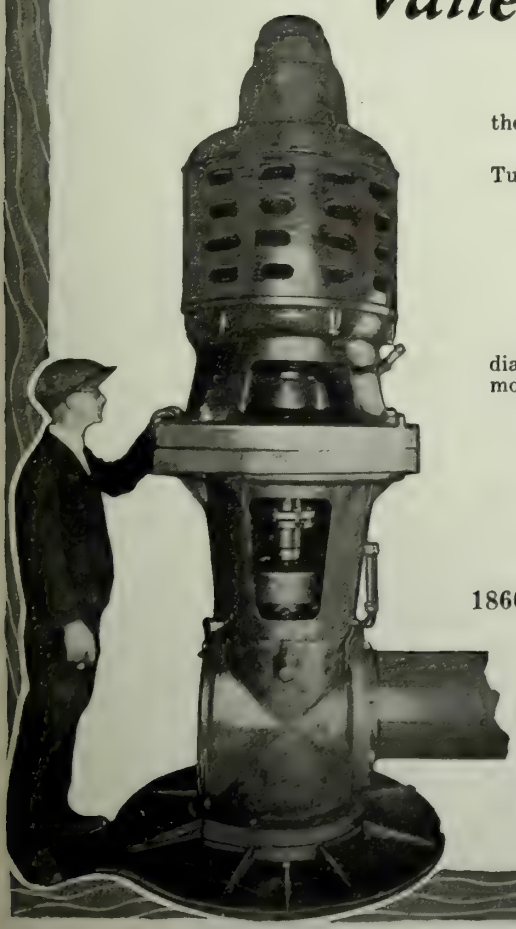
Senators L. D. Dennett, of Modesto, and Ralph Swing of San Bernardino, Assemblymen Water J. Little, Hermosa Beach, and A. C. Finney, of El Centro, are the Californians appointed as a committee to represent the state in the allocation of waters of the Colorado River. Pursuant to an act of the 1925 California legislature, this committee is empowered, after due investigation, to enter into an agreement with Arizona and Nevada determining the rights of the three states to share in the waters of the river.

Dr. Hubert Work, Secretary of the Interior, and Dr. Elwood Mead, Commissioner of Reclamation, have left Washington on an inspection tour of the west and northwest, which will require about a month for its completion. They will visit a number of reclamation projects and several national parks en route. Their itinerary includes stop-overs in Colorado, Wyoming, Oregon, Washington, Montana, and Idaho.

Well No. 23 E. O. S. on the Salt River Valley Water User's Association. This Kimball pump is delivering 552 Miners' Inches or over 6200 gallons per minute. Some idea of its size may be gained from the picture below.

53 Kimball Pumps

Now Used by the Salt River Valley Water User's Assn.-



High efficiency, low operating cost, long life without repairs are the outstanding reasons for the popularity of the Kimball Pumps.

The great volume of water being handled by Kimball Direct Flow Turbine Pumps for the Association may be judged by their having—

37 of the No. 18 Type.....5000-6000 Gallon Capacity.
1 of the No. 15 Type.....2500-3000 Gallon Capacity.
1 of the No. 13 Type.....2000-2500 Gallon Capacity.
1 of the No. 12 Type.....1500-2000 Gallon Capacity.
3 of the No. 9 Type..... 600 - 700 Gallon Capacity.
7 of the No. 7 Type..... 300 - 450 Gallon Capacity.

For large projects or for individual wells as small as 7 inches in diameter the Kimball Direct Flow Turbine Pumps will supply you the most water at the lowest cost.

City of Los Angeles Water Dept., Uses 40 Kimball Direct Flow Turbine Pumps

FRANK J. KIMBALL COMPANY

P. O. Box Arcade 1540

1860 E. 15th St. Los Angeles, California

The pump illustrated to the left is one of the No. 18 type, shown in actual use in illustration at the top, where it is delivering 6200 gallons per minute.

RECLAMATION

A SURVEY OF THE NATIONAL RECLAMATION OUTLOOK

By DR. ELWOOD MEAD

Commissioner, U. S. Bureau of Reclamation

OUR whole country is interested in the continuation and success of the national reclamation policy. On this depends the growth in population and wealth of some of the arid states.

Conditions created by the Great War have put an end to important irrigation development by private capital. This result has come through increase in construction cost and lessened profits of farming.

The money for building Federal irrigation works and to carry on their operation comes from the proceeds of the sale of public land, the repayment of the cost of these works by settlers and a part of the income from oil and timber lands. About $200,000,000 has been expended. It would take $110,000,000 more to complete the old projects and build the new ones for which appropriations have been made.

ON some projects all the money owing the government has been paid; on others the revenue derived has not even covered operating expenses. Last year one of the good projects paid 7 per cent of what it cost to operate it. Another paid only 15 per cent. The original idea of a revolving fund which would return in twenty years all the money invested, so that it could be used over again, has not worked out. One project that owed $440,000 only paid $25,000, or 6 per cent; another project that owed $11,000, paid only $69; another that owed $112,000 paid $6,000. Financial results of this kind would, if universal, soon bring reclamation to an untimely end through emptying the reclamation treasury.

While some projects pay little or nothing, others pay nearly all. Before we approve of entering on larger development which many desire, we should know what has brought about the present situation and put our house in order to meet new obligations. This has been the task of Secretary Work for the past two years.

In order to understand the situation, he created the Fact Finding Commission to ascertain why there were so many complaints, why there was such irregularity in payments and what changes ought to be made. He followed the report of this commission with successful endeavors to secure legislation by Congress. He followed these preliminary steps by appointing a Board of Survey and Adjustment to visit projects where conditions were most unsatisfactory, and acting on his motto that one look is better than a thousand words, he has made a 10,000 mile journey to visit a part of the Federal Reclamation projects and when urgent duties in Washington are attended to, will start on another 15,000 mile journey to visit the remainder.

The experience of the last 20 years, the conclusions of the Fact Finding Commission and what the Secretary has seen on this visit seem to make clear that the reclamation law centered too much attention on construction and gave too little attention to the agricultural and economic conditions. These are the things which measure earning power and ability of settlers to pay. There was a confident but unthinking belief that the building of an irrigation canal would, of itself, create irrigated agriculture. That once this was done settlers would flock in, and regardless of whether they knew anything about irrigation farming, whether they had any money, they could if given a piece of land somehow dig in and succeed.

Although irrigation under canals where water rights are costly requires intense culture and the growing of high priced crops to repay the money, there was nothing in the law that would authorize the selection of settlers, nothing to inform them of what changing a piece of raw land into a farm would cost. The charges imposed on alkali flats and areas of infertile shale were exactly the same as on the richest river silt on the same project.

RECLAMATION development has also suffered from the declaration in the Reclamation Act that all the money expended should be returned to the fund. Many projects were begun that required years to complete. All the earlier estimates were made when construction costs were low and usually the first part of the land settled came in under a low construction cost; when years later additional lands were irrigated, higher prices made costs greater and the next unit thrown open was at a higher cost than the original estimate and higher than the settlers on the settled part of the project were paying.

With every increase in cost there had to be a boost in prices of water right so as to avoid losses. This has resulted in great inequality of burdens on the same project. Discontent on the part of settlers carrying the larger costs was inevitable and it has created a difficult and embarrassing situation for those in charge.

ONE reason why settlers on projects that should be prosperous are not meeting their payments to the government is the fact that they owe private debts bearing a high rate of interest that take all the money they can spare from the operation of their farms and supporting their families. Not only is it to their interest to pay the debt that bears interest and postpone their debt that bears no interest, but great pressure is exerted on them to keep their money at home—let the government wait.

Many of these settlers' debts are due to a speculative inflation of land prices, which occurred on nearly all of these projects in the early stages of development. The generous terms of payment for water rights by the government made this a fruitful field for the land salesman, who would point out that all one had to pay on the water right was a low rate of interest for 20 years and then his payments would end, and it was often whispered to the settlers that if they stood together they could succeed in having payments postponed or written off en-

La Feria Water Improvement District
CAMERON COUNTY NUMBER THREE

Directors

Officers

La Feria, Texas 6/11/26

Mr. Wm. P. Chadwick,
Times Mirror & Printing House,
116 S. Broadway,
Los Angeles, Calif.

Dear Sir:-

Beg to acknowledge receipt of your letter of the 7th instant with reference to our Ruth Dredge. I am pleased to advise you that the District has used this machine for a little more than three years. We have been highly pleased from the results we have obtained from this machine. We feel that it is indispensable for canal cleaning. We can clean canals with dimensions of four feet bottom grade up to twenty feet bottom grade. We have been able to lessen our expense of maintaining canals to a very great extent by the use of this Machine.

We have used our Machine for constructing drainage ditches and have found it very satisfactory for this work. I understand certain parts of the Machine have been strengthened and I am of the opinion that with this improvement it can be used for constructing drainage ditches through soil that is not too hard with entire satisfaction.

Yours very truly,

LA FERIA WATER IMPROVEMENT DIST. CAMERON COUNTY #3.

Per W. W. Pres & Mgr

tirely. When Secretary Work asked an officer of a settlers' organization why they were not doing more to meet their payments, the answer was that until the government collected its debt from France, it ought not to ask settlers to pay.

This does not mean that many settlers on these projects are not going through a distressing experience. They have suffered as farmers everywhere have suffered but their trouble today is not so much meeting project costs as the high interest rates and the payment of principal on their private debts.

THE remedy for this is not to make reclamation a credit agency but to try and work out some system for the refunding of their debts which bear eight and twelve per cent interest. Many of them now are overdue and should be converted into long time amortized loans bearing low interest rates. Financial and economic relief should come from some other sources than postponement of payment of expenses for operating canals.

Secretary Work has taken a decided stand in this matter. One of the projects that has never paid operating expenses is to be sold for what it will bring. Where it is known that water users are able to pay, they are being pressed to pay, in justice to struggling, deserving settlers who had paid, and, where there is a refusal to pay, suits are being brought to collect. An end has been brought to the demoralizing practice of issuing blanket moratoriums which only pile up the debt to be paid in the future, which lets the well-to-do and prosperous escape their obligations in order that relief may be extended to those who ought to have it.

Hereafter, if the view of Secretary Work prevails, the relief extended will be individual and will be confined to those who can show that they have made every effort to meet their obligations to the government.

ON some projects there must be an adjustment of payments and the writing off of part of the cost. It was the conclusion of the Fact Finding Commission that on some of the projects money has been spent which cannot be recovered and that this loss should be admitted and the records revised to show the exact situation. This does not mean that the project costs on the good lands will be reduced. The Frannie Division of the Shoshone Project or the east side of the Uncompahgre Project are illustrations of the need for adjustment. Here canals have been built to covtr large areas of unfertile land. On the Shoshone project 200 settlers have abandoned these farms. On the Uncompahgre project there are thousands of acres that are not being cultivated and never will be. The cost of the canals to cover these areas should be written off.

It is certain that the increased cost of everything will be reflected in the future cost of irrigation works. The estimates for water rights for four new projects included in last year's appropriation vary from $125 to $160 an acre. That is far higher than the actual costs on any of the old projects. Hereafter, the land will be classified and the cost of water rights, instead of being uniform, will vary on different classes of land because earning power varies. On the project where the average cost is $160, the cost of the water right for the best land may be between $175 and $200.

In order that Congress might understand what would likely happen if these projects were built, four economic boards were created to study conditions and make a report as to whether they were feasible. These boards reported that, in addition to the cost of the water right, the settlers who took up farms would have to expend from $100 to $125 an acre for clearing the brush, leveling the land, constructing fences and farm buildings, providing the minimum of livestock and equipment, and paying expenses until crops could be grown. In other words, the settlers would have to spend from $5,000 to $10,000 in order to make these farms going concerns.

ALL of these investigators recommended that there should be, on every project, someone who had practical knowledge of conditions, who would act as an advisor to the settlers, telling them how and where to carry on development, what crops to grow and where to find markets. That settlers should be required to have some capital and some experience.

It was recommended that there should be some credit agency from which advances could be made to pay a part of the development cost. The opinion of many of those present was that the time had come when the State should be called upon to make some investment and effort in a development which meant more to it than to the nation.

The state view prevailed and on the four projects referred to there is a requirement in the appropriation that the State must agree in a contract with the secretary to take charge of settlement, to lay out and plan the development of the farms, to furnsh practical advice and direction, and advance money to complete the improvement and equipment of farms. The indications are that they will comply with these conditions and that an era of cooperative development is before us.

Agricultural Engineers Meet in Los Angeles

Elect New Officers and Hear Papers on Various Phases of Farming Engineer's Work

The Pacific Coast section of the American Society of Agricultural Engineers met in May in Los Angeles with twenty-five members from various parts of California in attendance. The meeting was held at the Clark Hotel, and after a banquet, the association listened with keen interest to three papers delivered by members, dealing with various phases of the work of the agricultural engineer.

Professor David Weeks, of the Division of Rural Institutions, University of California, read a paper dealing with the need of a national reclamation policy based on sound economic considerations. The first part of his paper was a discussion of the general problem of reclamation, with reference to the experience of the past and the demands of the future, and this was supplemented by an illustrated talk on illustrative aspects of the Spanish Springs project, with which Mr. Weeks has had exceptional opportunity to become acquainted by virtue of his position on a special board of investigators appointed by the Secretary of the Interior.

Max E. Cook, farmstead engineer of the California Redwood Association, delivered a very practical paper on the construction of farm buildings, illustrating his points with photographic slides of typical structures designed to serve the farmer withe the maximum of economy and convenience.

Prof. B. D. Moses, Division of Agricultural Engineering, University of California, delivered a progress report on the activities of the California Committee on the Application of Electricty to Agrculture, which brought out in detail many of the things which that body is now accomplishing.

Officers of the section for the ensuing year were elected by the association as follows:

Chairman: Prof. Frank Adams, Division of Irrigation Investigation and Practice, University of California, cooperating with the United States Department of Agriculture, Davis, California.

Vice-Chairman: Max E. Cook, farmstead engineer, California Redwood Association, Los Angeles.

Secretary and Treasurer: Prof. L. J. Fletcher, head of the Division of Agricultural Engineering, University of California Farm School, Davis.

TEXT OF McNARY RECLAMATION BILL

IN AN article in another part of this issue, Senator Charles L. McNary, of Oregon, chairman of the committee on Irrigation and Reclamation in the United States Senate, tells of his conception of the need for a new, comprehensive, national policy for reclamation and of a plan which he feels convinced would meet that need in a wise, constructive way.

"I am sending you a copy of a bill which I have just had printed," writes Senator McNary, "which embodies, in a legislative way, my views on this subject."

The bill, which is given in full herewith, will be introduced by Senator McNary before the first session of the Sixty-ninth Congress, which convenes next December. It is a document which will repay earnest study and careful thought by all friends of irrigation and reclamation. The bill follows:

A BILL to encourage the development of the agricultural resources of the United States through Federal and State cooperation.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That when used in this Act—

(a) The term "Secretary" means the Secretary of the Interior.

(b) The term "district" means any district organized under the law of any State to provide for the reclamation of lands for agricultural and home-making purposes, with authority to issue bonds which shall be a general charge against all lands within the district and to contract with the United States under this Act as provided herein.

(c) The term "farm" means an area of land within a reclamation project sufficient in size, in the opinion of the Secretary, to support a family, but not exceeding one hundred and sixty acres of reclaimed land.

(d) The term "excess lands" means all lands in a single holding in excess of one established farm.

SEC. 2. That the Secretary is authorized to investigate the feasibility of reclaiming the lands within any district in any State under contract with the district. One-half the cost of investigation shall be advanced by the district and one-half by the United States. Such investigation shall cover full details concerning water supply, engineering and economic features, the cost of construction, land prices, and the probable cost of developing and settling the lands to be reclaimed. If upon such investigation the Secretary concludes that reclamation is feasible, written finding to that effect shall be made and submitted to Congress for consideration, with copies of reports and other data upon which such conclusion of feasibility is based. Upon authorization by Congress and the appropriation, in whole or in part, of funds therefor, the Secretary is authorized, under contract with the district, to construct the necessary works for the reclamation of the lands involved and operate and maintain the same so long as such operation and maintenance are necessary, in the opinion of the Secretary, to safeguard the interests of the government. The total cost of construction and of operation and maintenance, which shall include a just portion of overhead expenses, shall be paid by the district to the United States.

SEC. 3. That before construction of a project is commenced the sizes of the farms therein shall be established and agreements shall be made effectively subjecting not less than 80 per centum of the excess lands within the project to disposal by authority of the Secretary to settlers at prices and terms fixed in advance in such agreements. Such prices and terms shall be determined with the view of placing a bona fide and competent settler upon each farm of the project with the least possible delay.

SEC. 4. That when, in the opinion of the Secretary, a project has been fully completed and successfully operated for one season the Secretary shall fix the construction cost thereof, which shall include the total cost of investigation, the expense of selling district bonds under section 5, interest at not exceeding 5 per centum per annum upon all sums advanced by the United States in the construction thereof, and the cost of operating and maintaining the project to the date of fixing such cost. This total cost the district shall agree to pay to the United States within a period not exceeding forty years, with annual interest thereon at not exceeding 5 per centum per annum: *Provided,* That upon receipt by the United States from the proceeds of district bonds, as provided in section 5, of such total cost with interest, the obligation of the district to the United States for construction shall be satisfied: *Provided further,* That upon the receipt of such total cost the moneys advanced by the district for investigation of the project shall be returned to the district. So long as the government operates and maintains a project the district shall also pay to the United States annually, upon terms to be fixed by the Secretary, the total cost of operation and maintenance.

IRRIGATION FINANCE

ADEQUATE FARM LOANS FOR IRRIGATED LANDS

1. Financing Lands Under New Irrigation Projects

By B. J. SEGER

OWNERS of irrigated lands have come to realize that it is becoming increasingly more difficult to secure adequate loans on lands in irrigated sections. It is a well known fact that loan companies do not hesitate to loan one hundred dollars per acre on farm lands in the rain belt, while they will loan but twenty-five to forty dollars per acre on irrigated lands and, in many instances, will make no loans at all.

Farmers on irrigated lands need as much if not more capital to farm successfully than those in the east who raise corn and small grain. The fact that crops grown under irrigation are more certain and under good farming methods, produce larger yields than where crops depend on rain fall, does not seem to influence the loan companies to favor loans on irrigated lands. Steps should be taken to remedy the situation brought about by this handicap, to the end that definite plans may be inaugurated which will improve these conditions.

B. J. SEGER

Secretary-Treasurer of the North Platte Valley (Nebraska) Water Users' Association and of the Farmers' Irrigation District.

It is not the purpose of this paper to present a plan for securing loans which will enable the landowner who already is deeply in debt to increase his indebtedness, but to show, if possible, how adequate loans at a low rate of interest may be secured where it is not possible at the present time. I hope to make some suggestions from which may be evolved definite plans for securing adequate farm loans for irrigated lands and which will give relief to the landowner who is carrying a heavy burden of debt at a high rate of interest.

We will first consider the irrigation system of a new project. We will take it for granted that the system is well built, its headgates and wasteways are well constructed and in good repair, the water supply ample and sure. The land appraiser or agent who desires to make loans under an irrigation project and is guarding the interests of his company will carefully inspect the irrigation system.

After investigating the physical condition of the system, the appraiser would desire to know first, the amount of bonded or construction debt per acre against the lands; second, plan of payment—how much is required to be paid yearly per acre; third, he would ascertain if any effort is being made on the part of the Board of Directors of the District to collect taxes or to see that they are paid with reasonable promptness.

If bonds were semi-serial—serial after ten years—they should be changed to a straight serial bond, for the reason that a considerable saving in interest could be made and, further, the payments would not become too heavy to be paid out of returns from the land, as the debt could be spread over as many years as necessary to bring the yearly payments within easy reach of the farmer.

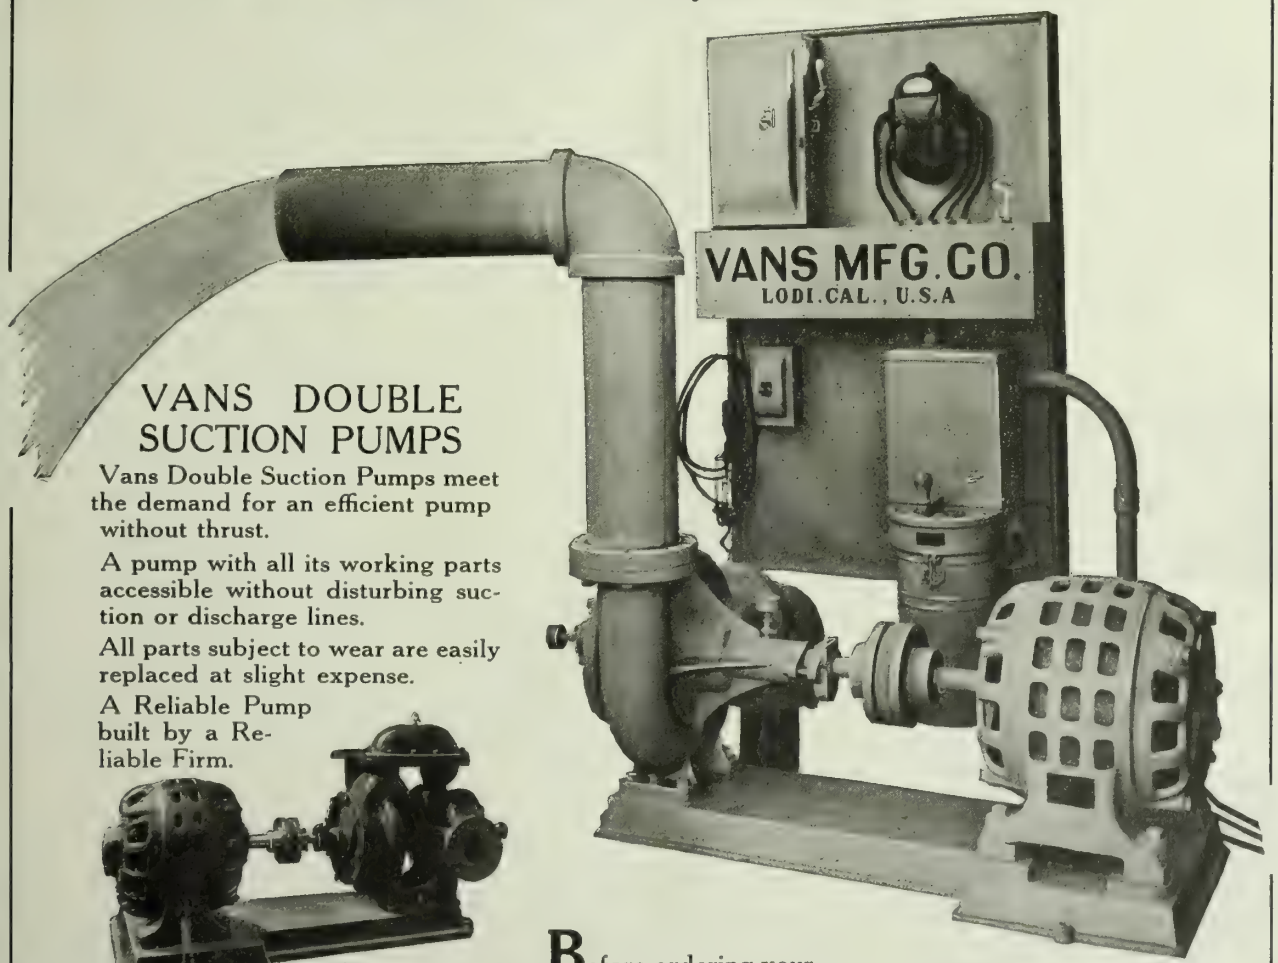
THERE would be several advantages to an irrigation district in issuing a serial bond. First, there would be a reasonable assurance that the bonded debt would be paid as the payments became due. Second, there would be a distinct saving in interest over the semi-serial type of bond. Third, with a strictly serial type of bond, the payments could be such that the land owner would be more certain of meeting them as they became due. The land owner would be in better position to secure a loan on his land for the reason that a loan company would be more willing to loan on lands that were not already overburdened with heavy water right charges or irrigation taxes.

With the irrigation district's finances arranged to the best advantage possible to the land owner, we are now ready to consider loans under *new* projects. It is a well known fact that it is very difficult to secure loans of any kinds on lands under a new irrigation project. If a loan is made, it is inadequate as a rule and usually bears a high rate of interest.

If a farmer on a new project is not able to secure a loan for a reasonable length of time, at a low rate of interest, for building his most necessary improvements and for the purchase of equipment and live stock, he will be greatly handicapped in getting his farming plant on a paying basis.

VANS PUMPS

Mean More Gallons per Horse Power



VANS DOUBLE SUCTION PUMPS

Vans Double Suction Pumps meet the demand for an efficient pump without thrust.

A pump with all its working parts accessible without disturbing suction or discharge lines.

All parts subject to wear are easily replaced at slight expense.

SAN FRANCISCO

Practically every farmer who buys land under an irrigation project has some cash and equipment at the start, but his funds are soon exhausted and usually he has not been in the community for a sufficient length of time to establish his personal credit. If he tries to borrow on his land from regular loan agencies, he seldom meets with success. The local bank, as a rule, is not in position to loan him money, in sufficient amounts on the security the individual farmer is able to give; nor can the banker make a loan to him for a sufficient length of time to give him opportunity to get his farming operations on a paying basis. How, then, can the irrigation farmer or land owner secure a loan for an amount which will allow him to purchase needed stock and equipment?

WE will take it for granted that the majority of landowners under an irrigation project, as described, came to the project with some cash and equipment. If all of the improvements, equipment, necessary farm implements, work horses and other stock owned by each farmer were pooled, the combined assets would form a basis for a strong cooperative association.

In a number of communities in Nebraska and other states, groups of farmers have organized Mutual Loan Associations for the purpose of purchasing dairy stock. Where properly organized, they have been successful. The amount of authorized capital stock depends on the size of the organization. The par value of one share is $100.00. Four kinds of stock are sold—paid up stock, partial payment stock, investment paid up stock and partial payment investment stock. After sufficient funds are secured from the sale of stock, money is then loaned at a low rate of interest to those desiring to purchase dairy stock. The cows purchased are given as security.

Such an association could be organized, on a somewhat larger scale, by a group of from one hundred to five hundred landowners. An association of this kind could be organized under the present laws of Nebraska, for example, if the name of the association included the word "Savings", such as: The Mutual Loan and Savings Association.

It would be feasible for land owners under new projects, and those landowners under one or more older projects, to organize such an association. In combining several projects, especially if they are comparatively small, it would be possible to provide sufficient funds to loan to the stockholders if funds from some outside source could be secured equal to the amount raised from the sale of stock of the association.

The United States Department of Agriculture recently issued a bulletin entitled "Irrigation District Operation and Finance", in which it was stated that two of our western states have assisted irrigation districts in those states by loaning the credit of the state, in the following manner: the State issues bonds which are sold, and the proceeds of the bonds are then loaned to the irrigation district. The district pays the interest on the bonds, and takes them up at the end of five or ten years.

Since this has been done in other states with good results, provision might be made whereby the state of Nebraska, let us say, or some other state where the plan has not yet been put into effect, would loan its credit in the same manner, to loan associations formed under irrigation projects for agricultural purposes, making it possible for the association to borrow an amount equal to the paid up stock of the organization. This would furnish sufficient funds with which to make loans. The amount loaned to the individual could be increased from year to year, as the funds for loan purposes increased. All loans to the members to be from one to three years with interest at the rate of 5 per cent to 6 per cent.

After the association had been organized for a few years, there would be funds returned from interest and loans paid which would enable the organization to have a revolving fund large enough for the needs of the members. There would be no limit to the possibilities and usefulness of such an organization, if properly managed.

THE advantage of such an organization would be, that all of the improvements, stock, farm equipment and credit of its members could be utilized to the fullest extent as security behind the stock issued. The expense would be small; all of the profit of the association would go to the members. The members, in turn, would be enabled to borrow money at a low rate of interest with which to purchase income producing stock and for the building of needed improvements. The better the farmer's equipment the greater his profits, which, in turn, would enable him to get on his feet financially in a comparatively short period of time.

A Mutual Loan organization in the community would not interfere with the regular banking business. In fact it would be of material help, for the reason that the association would take care of the long time loans, leaving the banks the thirty, sixty and ninety day loans. Since none but stockholders could take advantage of association loans, and only for agricultural purposes, there would

(*Continued on Page 49*)

A Word to Advertisers

Who Sell the Irrigation Market --including Allied Hydraulic Fields

THIS issue breaks new ground in the field of industrial journalism. Of MODERN IRRIGATION you will hear considerable, from this time on. In all the world there is no periodical like it; in all the United States no industry more important than that which it serves; none that has been more neglected, from the standpoint of development through sound merchandising and advertising, or that offers greater returns for the future.

Closely, indeed intimately, allied to irrigation is the great hydro-electric industry and the fields of municipal and industrial water supply. In many respects their interests are common interests—their problems mutual. Many of the engineers who lay out big irrigation projects are retained, in a consulting capacity, by municipal water systems and by hydro-electric interests. Because, in the West, the development of water supplies, and their conservation, presents a common problem, the publication will be followed closely by city engineers and water works superintendents as well as by executives and hydraulic engineers of the electric power companies. For it will contain much of helpful, practical value to them.

First of all, however, will it become the guide and manual of the irrigation field—a vast market with a total buying power greater, perhaps, than that of any one other industry; for in most sections of the West agriculture and irrigation are synonymous terms. By now, this issue is being read by men whose annual purchases aggregate millions. MODERN IRRIGATION is the logical and *only* medium offering direct coverage of the market which they represent.

The active cooperation of the leading men of the irrigation world, who will serve in an advisory capacity to the editors, stamp it as a publication of influence. As an advertising medium of the first water, its value will be quickly apparent. More and more, as each issue makes its appearance, will its pages become the recognized "Who's Who" of the equipment concerns which sell this field.

The publishers are preparing some intensely interesting memoranda of value to every advertiser who would like to sell more irrigation equipment. Letters or telegrams of inquiry will be answered promptly, and involve the sender in no obligation—other than intelligent consideration of the medium which already is the organized voice of the irrigation movement, and which is destined to become a real service institution to readers and advertisers alike.

OVERHEAD IRRIGATION

MY CITRUS TREES GET ALL THEIR WATER FROM ABOVE

By F. H. MACPHERSON

IN ENTERING upon a discussion of the subject of overhead irrigation, as applied to citrus husbandry, I should like to have it understood that I do not pose as an expert, nor as one having had even a long experience in things agricultural. My trend of thought until I came to California was along entirely different lines. I had, however, for over ten years, dreamed of the time when it would be possible to retire from a rather strenuous business life to the quiet and sunshine of the wonderful West. In 1920 this became possible. For some years previously I had owned the ten-acre orange grove upon which I located on arrival in California, but as happens frequently with the "absentee landlord" I had paid very little attention to the grove, with the result that when I did come I found it in very poor condition; which is evidenced by the fact that I have removed over one hundred and fifty of the trees then in the grove replacing them with re-sets. Shortly after arrival, I began taking an interest in the grove, watching the various phases of citrus culture as each developed.

TWO TYPES OF HEADS. (ABOVE) REVOLVING SPRAYS SET IN ALTERNATE ROWS, ONE TO EVERY OTHER TREE; (BELOW) TRYING OUT A SYSTEM OF ONE HEAD TO EACH TREE.

I was immediately impressed with the seeming inadequacy of the irrigating methods generally practiced, and I started experimenting along lines which occurred to me as being more nearly nature's way of supplying moisture. I started out in 1921 with one head (of spraying equipment) coupled to my domestic water line. I followed this with five other heads, later adding eight more, until I had thirteen heads in operation by August, 1922. I made note from time to time of the seemingly advantages of overhead irrigation over the furrow method, and so fully convinced was I of these advantages that I decided upon equipping the entire grove with the overhead system. This was completed by November, 1922. A little while before I had decided upon the complete installation, I learned, for the first time, that two or three other citrus growers had antedated me, and were irrigating their groves with sprinklers almost identical in type with those I had been trying out, but portable, while mine were stationary. I mention this in fairness to others who had been working along similar lines.

My entire grove has been under the over-head system of irrigation for two and one-half years, and the results have thus far been entirely satisfactory. It should always be remembered that the grove was in a very much run-down condition when I installed the over-head equipment, and that even yet I have not gotten the trees back to such a point of health and growth as would give the crop returns to which one would be entitled from trees as old as mine, had they been properly cared for from the start.

HERE, perhaps, will be the logical point in this article to enumerate the advantages which up to this time I have satisfied myself accrue to the user of the overhead method of irrigation:

1—The ability to get and to apply moisture, when and where, as shown by the soil auger, it is needed.

2—The fact that there is absolutely no loss of water during irrigation. None of this precious fluid escapes down the ditches by the roadside; or over into the neighbor's grove; or down through the soil at the upper and lower ends of the grove.

3—Loss of water by evaporation is reduced to a minimum, as all irrigation is done at night.

4—The fact that 100 per cent of the root area receives moisture, reasonably and evenly distributed.

5—A very considerable saving in the quantity of water required during the ordinary irrigation season.

6—No carrying of the silt from the upper to the lower end of the grove.

7—The keeping of the tree and leaves free from dust and dirt, greatly improving the appearance of the foliage and the quality of the fruit.

CAMPBELL
OVERHEAD IRRIGATION

DISTRIBUTES the water applied in the form of small drops just like a gentle rain—not in a mist that will be lost by evaporation or in a deluge that will wash the soil.

Gives a 100% distribution over the entire area irrigated. Apply an inch or less of "rain"; let it stand for a few hours and dig where you will and not a spoonful of dry earth can be located.

Requires less than half the water necessary for the ditch or furrow system where there is an immense waste on account of varying texture of soil and run-off.

Affords an immense saving in labor. Simply open the valves and let it "rain" on a section of one, five or ten acres for a few hours—then shut off and turn on another section. No furrowing needed in advance of irrigating.

Obviates the necessity of terracing and contour planting—even on the steepest hillsides. Trees can be planted square and every drop of water applied will soak in.

Prevents and disintegrates plow-sole—thus making sub-soiling and deep cultivation unnecessary.

Absolutely prevents damage from wind-burn. Moisture carried by the wind will entirely check evaporation from the leaves and fruit.

Saves the expense of spraying for red spider and other insects and by keeping the trees in a healthy condition will make all, or practically all, fumigation unnecessary.

Prevents June drop by eliminating the evaporation from the trees that causes it.

Gathers nitrogen from the air and forces downward distribution of nitrates and soluble parts of manure that have been applied near the surface. It also carries humus in solution below ploughed depth to all deep-lying roots.

We make complete guaranteed installations including pumping equipment for boosting machinery if desired or will sell you the necessary equipment, make your plans and superintend installation.

J. P. CAMPBELL IRRIGATION CO.
SUITE 240 WILCOX BLDG. LOS ANGELES, CALIF.

We can supply you one of the brass ball-bearing sprinklers that we use so extensively on OVERHEAD IRRIGATION installation with a 4 ft. portable stand and hose connection so you can try it out on your domestic water supply. The price is $7.00 and we will refund your money if you wish to return it.

For Detailed Listings, Branch Offices, Etc., See the Buyers' Guide to Leading Supply Sources—Pages 55-56

8—Eliminating the necessity of deep plowing.

9—Elimination of plow sole.

10—Has eliminated to date, the necessity of spraying for red spider.

11—Forces downward distribution of nitrates and soluble parts of manure applied near surface. Carries humus in solution below plowed depth, to all deep-lying feeding roots.

12—A possible reduction in cost of fertilizer, as a result of the more thorough distribution and more efficient utilization thereof.

13—The elimination of June drop.

14—The washing off of very much of the "honey-dew" deposited upon the fruit as a result of black scale and aphis, thereby sending the fruit to the packing house in a very much cleaner condition than would be otherwise possible.

15—More uniform and earlier growth of cover crop.

16—Production, by natural means, of the deep, reddish-yellow fruit which packing house experts have for years been trying to produce, both by natural and by artificial means.

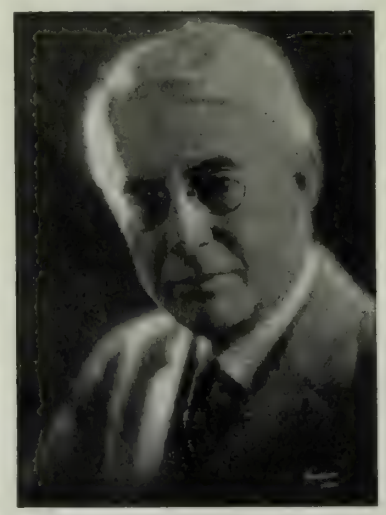
17—A very material saving of expense of furrowing, of labor in making connections with irrigation stands, of labor in irrigating and of cultivation after irrigating.

18—The ability to supply moisture to the tree and root system more nearly in nature's way in summer, and in winter as well, when there is a shortage of rainfall as during the winter just passed.

19—The prevention of damage from frost, at least down to a temperature of 25 degrees.

MOST of these advantages are so self-evident that no additional testimony in support of them is necessary. During the irrigation season, May 1st to November 1st, I used upon my 8½ acres 405,700 cubic feet of water, or 13.15 acre inches. A comparison with five of my neighbors covering 39 acres showed a total of 3,138.000 cubic feet of water, or 20.75 acre inches used by them, being over 50 per cent more water used by the furrowing method than by the overhead method of irrigation. Consider further that in the case of irrigation by overhead sprinkling 100 per cent of the root area received moisture, while by the furrow method possibly not to exceed 60 per cent to 70 per cent of the root area was reached. The soil is of substantially the same type throughout the area under comparison. A natural query just here would be: Did my grove receive as much water as it should have had? The reply is that the moisture conditions were excellent throughout the entire season, as can readily be attested by between 400 and 500 citrus growers in Southern California who visited the grove during the irrigation season, who saw soil-auger tests made, and who also had opportunities of noting the general condition of the grove.

Perhaps I ought to say here that the soil in this neighborhood is of a comparatively light type. I have had no experience with the heavier soils, but it occurs to me that if the owner of the grove with the heavier soil will provide himself with sprinkling equipment which will spread the water over the grove in smaller drops, and possibly at a slower rate of speed, giving the moisture an opportunity to seep in, the same results can be obtained as in the case of the lighter soils.



F. H. MACPHERSON, writer of the accompanying article, is an overhead irrigation "fan," who has probably done more than any other one grower of citrus fruits to give the over-head theory a practical demonstration under actual growing conditions, on his eight and one-half acre ranch, "Sunny Slope," at San Gabriel, California.

Mr. MacPherson came to California five years ago with the intention of "seeking retirement." His fifty-nine years of business life in the east had been full and varied, including successful experience as a publisher, accountant and financier, in addition to which he was connected with several of the large paper-manufacturing firms of the east in executive capacity. In addition to his horticultural interests, he is now a director of a large number of financial, business and civic organizations of Southern California, and is president of the Sunny Slope Water Company.

Turning on two valves down in the center of the grove constitutes all the hard work there is connected with the actual irrigation under this method. Our irrigation is all done at night, but late in the afternoon of the day preceding the system is turned on, and the heads that for any reason are found not to be working perfectly are inspected and the cause of the trouble removed. As soon as the moisture conditions permit, the grove is cultivated in order that it may hold the moisture content to the best advantage. The cost of cultivation during the irrigation season of 1924 did not exceed $20.00 per acre. We are doing some experimenting with different methods of tillage and may have some rather interesting reports to make thereon at a later date.

McNary on Reclamation

(*Continued from Page 18*)

and the money covered into the Treasury of the United States, to be again advanced to other projects. By a scheme of a fund revolving in character, a limit would be placed upon the amount of money to be advanced by the government. Private initiative would be called upon to carry the projects through to a successful development and private capital would find a new and inviting field of investment, thereby relieving the government of a continued burden. The whole of the sums advanced would be returned to the Treasury of the United States, assuring the government against loss and relieving it from a permanent contribution in the development of its resources.

A bill embodying provisions similar to the suggestion briefly outlined was introduced by me in the Senate a few years ago, and by Congressman Smith of Idaho in the House. The bill passed the Senate, but was not pressed in the House for the reason that the depression which faced agriculuture throughout the country did not seem to offer an opportunity calculated to insure its passage.

Inasmuch as the Colorado River project is pressing for government action, and others of kindred nature are being considered, it seems appropriate that the Congress should again consider a plan which contemplates the inclusion of all reclamation, wheresoever located in the states, free from the appeal of special appropriation for particular projects.

Some plan of development of the nation's agricultural and water resources should be conceived and written into law so that the advocates of development and the patrons of investments may know in what manner and to what extent Federal aid and encouragement may be expected. Otherwise, and in the absence of a national policy, the Congress will be called upon interminably to legislate in a field rich in rivalry and poor in a policy designed to insure the Treasury against exploitation and the country against overexpansion of our latent resources.

Adequate Farm Loans

(*Conitnued from Page 44*)

still be a large field for the services of the local banker.

With such associations on the projects to take care of the needs of the farmer as to loans for the first few years, he would soon be established on a good financial basis. Members of such an organization would have no trouble in securing real estate loans from the Federal Land Bank or from the Joint Stock Land Bank, if needed. The mere fact that such land owners operated a successful loan organization among themselves, would give the loan companies confidence in the individual members and in their ultimate success.

It is quite certain that loans secured from the Federal Land Bank will be more satisfactory as to the amounts loaned when irrigation projects and the landowners under them realize the importance of getting their indebtedness on a basis which will not be burdensome to them, and, therefore, not so hazardous for the loan company.

THE Joint Stock Land Bank has not yet made any loans on irrigated lands in Nebraska. As to other states where irrigation is practiced, I cannot say with any certainty. No doubt this bank will make loans on irrigated lands just as soon as a project and the landowners under it can demonstrate their ability to pay their obligations when due. The rules of this bank permit it to make loans to landowners whether they live on the land or not; but the owner must live in the vicinity of the land so that he can give the farm his personal supervision.

Both of the loan agencies mentioned make farm loans at a low rate of interest on the amortized plan for repayment. After a number of years of experience, this plan for repayment is found to be the most satisfactory. This kind of loan seems to be the best for the land owner for the reason that the yearly payments are not excessive, and a small part of the principal is paid each year.

Dr. Elwood Mead, Commissioner of Reclamation, has the following to say regarding the financing of farmers under irrigation projects:

"In other countries where irrigation works are built by the government, provision is made for helping the settler prepare his land for irrigation and improving and equipping his farm. This is regarded as much a part of reclamation financing as providing the money to build the canals and laterals and reservoirs. Aid of this kind is given by Italy, Egypt, India and different Australian States,

SURVEY *of* IRRIGATION DEVELOPMENT

As Shown by Official Records of the Month -- Local, State, and Governmental

NEW PROJECTS AND DEVELOPMENTS CONTEMPLATED

AMONG the permits to appropriate water issued by the Department of Public Works, Division of Water Rights of California during the month of May, 1925 were those listed as follows:

Permit No. 2073, Application No. 3699 (Tulare County)—Issued to C. M. Jones, W. W. Slayden, Porterville, Calif., May 6, 1925, for 24 cubic feet per second from Tule River in Sec. 14, T 21 S, R 29 E, for power purposes in Sec. 15, proposes to develop 183 T.H.P. Estimated cost $15,000.00.

Permit No. 2074, Application No. 4242 (Del Norte County)—Issued to E. F. Raymond and Sons, Crescent City, Calif., May 6, 1925, for 0.008 cubic foot per second from an unnamed gulch in Sec. 9, T 17 N, R 3 E, H. M., for irrigation purposes in Sec. 8. Estimated cost $350.00.

Permit No. 2075, Application No. 1611 (Sutter County) Issued to D. W. Carmichael, Sacramento, Calif., May 7, 1925, for 28.36 cubic feet per second from Feather River in Sec. 1, T 12 N, R 3 E, M.D.M.. for irrigation of 1593.03 acres near point of diversion. Estimated cost $30,000.00.

Permit No. 2076, Application No. 4218 (Yolo County)—Issued to Holland Land Co. et al, San Francisco, Calif., May 7, 1925, for 35 cubic feet per second from West Cut of Reclamation District No. 999 in Secs. 33 and 21, T 6 N, R 3 E, M.D.M. for irrigation of 2800 acres near point of diversion. Estimated cost $10,000.00.

Permit No. 2077, Application No. 3290 (Sutter County)—Issued to P. J. Hiatt, Woodland, Calif., May 8, 1925, for 15.45 cubic feet per second from Sacramento River in Sec. 12, T 12 N, R 1 E, for irrigation of 1,073.10 acres near point of diversion. Estimated cost $15,000.00.

Permt No. 2079, Application No. 4085 (San Bernardino County)—Issued to A. I. Rouda, Los Angeles, California, May 15, 1925, for 0.025 cubic foot per second from an unnamed spring in Sec. 9, T 2 N, R 1 W, for irrigation of 40 acres in Sec. 9. Estimated cost $2,500.00.

Permit No. 2080, Application No. 4081 (Calaveras County)—Issued to Anten Pozar, Angels Camp, Calif., May 16, 1925, for 0.05 cubic feet per second from a spring in Sec. 22, T 4 N, R 13 E, for domestic use and irrigation of 10 acres in Sec. 27. Estimated cost $500.00.

Permit No. 2081, Application No. 4494 (Nevada County)—Issued to W. H. Griffith and F. M. Ray, Nevada City, California, May 19, 1925, for 136.24 acre feet per annum from Rock Creek in Sec. 25, T 17 N, R 8 E, for fish culture and recreational purposes in Sec. 25. Estimated cost $2,500.00.

Permit No. 2082, Application No. 1270 (Nevada County)—Issued to Nevada Irrigation District, Grass Valley, Calif., May 19, 1925, for 500 cubic feet per second and 65,000 acre feet per annum from Canyon, Texas, Fall, South Fork Fall Creeks and South Fork Yuba River, in Nevada County, for irrigation of 208,000 acres in Nevada Irrigation District. Estimated cost $2,856,460.00. South Fork of Midale Yuba River in Sec. 28, T 19 N, R 12 E, M.D.M. for power purposes in Sec. 16. Proposes to develop 6136 T.H.P. Estimated cost $75,00000.

Permit No. 2084, Application No. 2075 (Nevada County)—Issued to Nevada Irrigation District, Grass Valley, Calif., May 19, 1925, for 75,000 acre feet per annum from Mddle Fork Yuba River in Sec. 11, T 19 N, R 12 E, for power purposes in Sec. 16. Proposes to develop 12,927 T.H.P.

Permit No. 2085, Application No. 2276 (Nevada County)—Issued to Nevada Irrigation District, Grass Valley, Calif., May 19, 1925, for 75,000 acre feet per annum from Middle Fork of Yuba River in Sec. 5, T 18 N, R 12 E, for irrigation of 208,000 acres in Nevada Irrigation District.

Permit No. 2086, Application No. 2277 (Nevada County)—Issued to Nevada Irrigation District, Grass Valley, California, May 19, 1925, for 5,000 acre feet per annum from South Fork of Middle Fork of Yuba River in Sec. 5, T 18 N, R 12 E, for irrigation of 208,000 acres in Nevada Irrigation District.

Permit No. 2087, Application No. 2372 (Nevada County)—Issued to Nevada Irrigation District, Grass Valley, California, May 19, 1925, for 300 cubic feet per second and 65,000 acre feet per annum from Canyon, Texas, Fall and South Branch of Fall Creek in Nevada County for power purposes in Sec. 16. Proposes to develop 12,927 T.H.P.

Permit No. 2088, Application No. 2373 (Nevada County)—Issued to Nevada Irrigation District, Grass Valley, California, May 19, 1925, for 150 cubic feet per second and 12,500 acre feet per annum from South Wolf Creek in Section 25, T 15 N, R 8 E, for irrigation of 208,000 acres in Nevada Irrigation District.

Permit No. 2089, Application No. 2881 (Placer and Yuba Counties)—Issued to Camp Far West Irrigation District, Auburn, Calif., May 20, 1925, for 10,000 acre feet per annum from Bear River in Secs. 20 and 21, T 14 N, R 6 E, for irrigation of 4,102.37 acres near point of diversion. Estimated cost $125,000.

Permit No. 2090, Application No. 3843 (Placer and Yuba Counties)—Issued to Camp Far West Irrigation District, Auburn, California, May 20, 1925, for 50 cubic feet per second from Bear River in Secs. 20 and 21, T 14 N, R 6 E, for irrigation of 4,102.37 acres near point of diversion.

Permit No. 2091, Application No. 4105 (Sutter County)—Issued to Thomas J. Johnson et al, Sacramento, Calif., May 20, 1925, for 2.4 cubic feet per second from Feather River in Sec. 4, T 11 N, R 3 E, for irrigation of 192 acres near point of diversion.

Permit No. 2092, Application No. 4084 (Riverside County)—Issued to Western Savings Bank, Long Beach, Calif., May 20, 1925, for 0.2 cubic foot per second from an unnamed canyon in Sec. 24, T 6 S, R 5 W, for domestic use in Sec. 24.

Permit No. 2093, Application No. 3974 (Siskiyou County)—Issued to J. O. McBroom et al, Cecilville, Calif., May 22, 1925, for 37.5 cubic feet per second from Cecil Creek in Sec. 32, T 38 N, R 11 W, for mining purposes. Estimated cost $4,000.

Permit No. 2097, Application No. 4189 (San Bernardino County)—Issued to Giacomo Abbona, Chino, Calif., May 25, 1925, for .05 cubic feet per second and 6.14 acre feet per annum from an unnamed spring in Sec. 20, T 2 S, R 8 W, for irrigation of 13 acres in Sec. 20.

Permit No. 2098, Application No. 4351 (Yolo County)—Issued to Manuel Rose, Sacramento, Calif., May 25, 1925, for 1.25 cubic feet per second from Sacramento River in Sec. 2, T 10 N, R 3 E, for irrigation of 100 acres near point of diversion. Estimated cost $1,000.00.

Permit No. 2099, Application No. 4349 (Yolo County)—Issued to H. T. Silvius, Sacramento, California, May 27, 1925, for 1.25 cubic feet per second from Sacramento River in Sec. 11, T 10 N, R 3 E, for irrigation of 100 acres in Secs 10 and 11. Estimated cost $2,000.00.

Permit No. 2100, Application No. 2100 (Amador County)—Issued to J. W. Preston, Jr., San Francisco, Calif., May 27, 1925, for 350 cubic feet per second and 60,000 acre feet per annum from North Fork Mokelumne River in Sec. 33, T 8 N, R 16 E, for power purposes in Sec. 24, T 7 N, R 13 E. Proposes to develop 49,597 T.H.P. Estimated cost $6,000,000.

Permit No. 2101, Application No. 2548 (Amador County)—Issued to J. W. Preston, Jr., of San Francisco, California, May 27, 1925, for 350 cubic feet per second from Cole and Beaver Creeks and Bear River in Sec. 5, T 7 N, R 16 E, and Secs. 2 and 11, T 7 N, R 15 E, for power purposes in Sec. 24, T 7 N, R 13 E. Proposes to develop 49,597 T.H.P.

Permit No. 2102, Application No. 2996 (Amador County)—Issued to J. W. Preston, Jr., San Francisco, California, May 27, 1925, for 225 cubic feet per second from North Fork of Mokelumne River in Sec. 24, T 7 N, R 13 E, for power purposes in Sec. 32, T 6 N, R 12 E. Proposes to develop 37,483 T.H.P. Estimated cost $250,000.

Permit No. 2104, Application No. 1081 (Calaveras and Tuolumne Counties)—Issued to Oakdale and South San Joaquin Irrigation Districts, Oakdale and Manteca, Calif., May 29, 1925, for 96,195 acre feet per annum from Stanislaus River in Sec. 11, T 1 N, R 13 E, for irrigation of 145,358 acres near point of diversion. Estimated cost $2,000,000.00.

Permit No. 2105, Application No. 2460 (Calaveras and Tuolumne Counties)—Issued to Oakdale and South San Joaquin Irrigation Districts, Oakdale and Manteca, Calif., May 29, 1925, for 2000 cubic feet per

second and 150,000 acre feet per annum from Stanislaus River in Sec. 11, T 1 N, R 13 E, for power purposes in Sec. 10. Proposes to develop 53,409 T.H.P. Estimated cost $2,000,000.

Permit No. 2106, Application No. 3091 (Calaveras and Tuolumne Counties)—Issued to Oakdale and South San Joaquin Irrigation Districts, Oakdale and Manteca, Calif., May 29, 1925, for 25,704 acre feet per annum from Stanislaus River in Sec. 11, T 1 N, R 13 E for irrigation of 145,358 acres near point of diversion.

Permit No. 2107, Application No. 4122 (Plumas County)—Issued to Ellen McMann et al, Wonderland, Calif., May 29, 1925, for 0.37 cubic foot per second from ings Creek and Cold Spring in Sec. 19, T 30 N, R 6 E, for domestic use and irrigation of 30 acres in Sec. 30. Estimated cost $50.00.

Permit No. 2108, Application No. 4167 (San Diego County)—Issued to Edward R. Burt, San Felipe Valley, Calif., May 29, 1925, for 12 acre feet from an unnamed wash in Sec. 2, T 13 S, R 5 E, for domestic use and irrigation of 5 acres near point of diversion. Estimated cost $500.00.

Permit No. 2109, Application No. 4419 (Los Angeles County)—Issued to Camp McClellan Improvement Co., Los Angeles, Calif., May 29, 1925, for 0.02 cubic foot per second from spring near source of Moscal Creek in Sec. 2, T 3 N, R 8 W, for domestic purposes in Sec. 35. Estimated cost $12,200.00.

Power Developments

The Federal Power Commission has recently authorized the issuance of the following licenses and permits, for projects in the irrigation country:

Project No. 103—To Messrs. Pattee, Bernhard and Ross, of Oakdale and San Francisco, Calif., and Astoria, Ore., respectively, a premilinary permit for 18 months for a power project located on the North Fork of Stanislaus River, in Tuolumne and Calaveras Counties, Calif. The proposed development will consist of a large storage reservoir having a capacity of 32,000 acre feet to be known as the Ramsey reservoir, and a conduit conveying water from a point about a mile below the reservoir to a power house located about 11 miles downstream. The estimated installed capacity is 5,000 horsepower.

Project No. 514—To Mr. Stephen E. Kieffer of San Francisco, Calif., a preliminary permit for 18 months for a power project in the Cosumnes River, in Amador and Eldorado Counties, Calif. It is proposed to construct a dam about 300 ft. high, forming a reservoir of 470,000 acre-feet capacity and to discharge the water from the reservoir through a power house to be located at a point lower down on the river, thereafter using the water for irrigation, domestic and municipal purposes for lands and cities in the Sacramento Valley west of the dam in addition to the development of power.

Project No. 527—To the Ventura Power Corporation of San Francisco, Calif., a preliminary permit for 18 months for a project located in Ventura and Los Angeles Counties, Calif. This project includes a series of power developments on Piru Creek involving the construction of two dams and storage reservoirs and three power houses with conduits leading to the latter. The aggregate power capacity of these sites is estimated to be 6,000 horsepower. It is expected that the power to be developed will be sold to public-utility companies in Southern California, and that a certain amount of the water will be used for the irrigation of lands below the project.

Project No. 121—(James B. Girand): The commission voted, since the consideration of the project for power development at Diamond Creek on the Colorado River, Arizona, has been intimately associated with the terms of the pending pact between the states of Wyoming, Colorado, New Mexico, Arizona, and California, which Arizona has refused to ratify and to which California proposes stipulations, and since a hearing has been demanded by protestants to the issuance of the license from the upper reaches of the Colorado, that such hearing be granted them, to be held in September next, in this city. It was voted, also, that unless adequate reasons are then presented against the issuance of the license, it is the thought of the Commission that a license shall then be granted.

New Incorporations

The following new water companies have been incorporated in California during the last month for which official records are available:

No. 114055—CLUB LAND & WATER CO., (a California company). Directors: M. C. Parker, F. E. Young, R. J. Hopper, all of Los Angeles, (each 1 share). Date of filing, May 6, 1925. Place of business, Los Angeles. Capital stock, $100,000. Par value, $100. Amount subscribed, $3000.

Purposes—"To develop and produce water by sinking wells for irrigation, also for creating ponds and artificial lakes to be used for irrigation and in connection with sporting, hunting, fishing and pleasure clubs and to create hunting grounds."

Articles filed by Dryer, Castle & Hartke, 615 Van Nuys building, Los Angeles.

No. 114087—SOUTH SIDE WATER CO., (a California company). Directors: A. C. Philpott, V. E. Bonham, A. J. Dutton, A. J. Bresnahan, O. V. Miller, all of Pomona, (each 1 share). Date of filing, May 8, 1925. Place of business, Pomona. Capital stock, $10,000. Par value, $10. Amount subscribed, $50.

Purposes—"To maintain and operate wells, pumps and reservoirs and pipe lines and to distribute water to its stockholders for irrigation and domestic purposes."

Articles filed by R. K. Pitzer, 324 Investment Building, Pomona.

Adequate Farm Loans

(*Concluded from Page 49*)

and South Africa. It is also a kind of aid given by all progressive European countries in helping poor men to buy and improve farms. The omission of this feature in the Reclamation Act should be corrected to bring us into line with the experience of other irrigated countries and to relieve credit conditions on existing projects. In these other countries, the estimates for the cost of improving and equipping farms are made with the same care as the estimates for building the irrigation works. In some cases the settler is required to have part of the money needed to carry out this development, and the state loans him what is lacking. The rate of interest on these loans varies from 3½ to 5½ per cent. The payments are amortized and they run all the way from three years, for the purchase of livestock, to twenty years for loans on buildings and other permanent improvements on the land. Usually these loans are made by some government official, who is appointed because of his agricultural knowledge and familiarity with conditions, and he combines with those functions that of being advisor to settlers to work out programs that will increase the farmer's income, and, along with low rates of interest, promote his prosperity."

In a recent article in the *Country Gentleman*, Dr. Mead has the following to say regarding the lack of interest which states in the arid west have toward lending assistance in the development of new projects:

"There has been a surprising indifference on the part of the arid states as to the method of settlement adopted, or the hard conditions met by the settlers.

The whole matter has been regarded an affair of the government. This is not as it should be. Nearly all of the arid states are now in a position to share in the financial responsibility. If they had such a share, there would be more careful scrutiny of proposed new projects and a more rapid and prosperous agricultural development."

Dr. Mead states further: "The advisory committee made two economic recommendations which ought to have the support of everyone. I will only quote the first one as follows: 'Project settlers are in need of relief from paying high interest rates on short time loans. They are often unable to borrow money with which to improve and equip their farms. A credit fund should be provided under competent control, from which settlers on the project can borrow money with which to make permanent improvements or to buy needed equipment and livestock. Loans for permanent improvements, secured by the land, should run not to exceed thirty years; loans for equipment and livestock, not to exceed five years. The rate of interest should be five per cent; payments of principal should be amortized; the making of loans should be at the discretion of the credit authorities.' "

I am fully convinced that it would be entirely feasible and proper to ask the state to not only lend its credit to enable irrigation farmers to secure working capital, but to show more interest in the agricultural problems of the farmer on irrigated lands. It is certain that the irrigation farmer, if he is to succeed, must be able to secure loans at a low rate of interest and for a reasonable length of time for repayment.

Text of McNary Bill

(*Concluded from Page 41*)

SEC. 5. That preceding any expenditure by the United States on account of construction of a project, bonds of the district equal in face value to the amount of the proposed expenditure shall be duly issued and delivered to the United States. If at any time it should appear to the Secretary that the original bond issue is insufficient to cover the cost of the proposed work, he may either curtail the work or require the district to issue additional bonds, and when the total cost of the completed project has been determined under section 4, all bonds issued in excess of such cost shall be canceled. The bonds shall be in form approved by the Secretary and shall run for a period not exceeding forty years, bear interest at a rate to be fixed by the Secretary not exceeding 5 per centum, payable annually, and be issued in denominations of $25, $50, $100, $500, and $1,000. These bonds shall be deposited with the Federal Farm Loan Board, and when the project cost is known and the value of all of the property of the district subject to assessment for the payment of the bonds shall reach twice the par value of the bonds as found by the said board, the board shall offer the bonds at public or private sale at not less than par under terms and conditions to be provided by rules and regulations to be made by said board. The moneys received from the sale of the bonds shall be credited upon the district contract. Prior to sale of the bonds the board shall collect all moneys due thereon, and the same shall likewise be credited upon the district contract.

SEC. 6. That unentered and unpatented arid and semi-arid lands of the United States susceptible of reclamation may be included in a district and may be subjected to the provisions of the Act of August 11, 1916 (Thirty-ninth Statutes, page 506), in accordance with the terms of said Act.

SEC. 7. That the United States may acquire lands hereunder for construction, but not for agricultural purposes: *Provided,* That the Secretary is authorized to accept, by gift, deed in trust, or otherwise, land within any district and dispose of the same upon terms and conditions to be agreed upon with the grantor or later fixed by the Secretary.

SEC. 8. That the Act of June 17, 1902 (Thirty-second Statutes, page 388), and all amendatory or supplementary Acts shall hereafter be known as the National Irrigation Law, and the fund provided for by said law shall hereafter be known as the National Irrigation Fund. This Act, and all amendatory or supplementary Acts, shall be known as the National Reclamation Law, and for the purpose of carrying out its provisions there is hereby established in the Treasury a fund to be known as the National Reclamation Fund. There is hereby authorized to be appropriated from any moneys in the Treasury not otherwise appropriated such sums as may be determined by Congress to be transferred from time to time to the National Reclamation Fund and appropriated upon estimates made by the Secretary for carrying out the provisions of this Act. All moneys received by the United States under this Act shall be paid into the National Reclamation Fund, and all moneys at any time in said fund shall be available for appropriation for the purposes of this Act.

SEC. 9. That the Secretary is hereby authorized to perform any and all acts and to make such rules and regulations as in his discretion may be necessary for carrying the provisions of this Act into full force and effect.

AMONG OUR CONTRIBUTORS

Some Editorial Jottings About Current and Forthcoming Feature Articles Dealing With Practical Problems of Irrigation, and the Men Who Have Written Them

A BILL providing for a new national reclamation policy, supplementing the present reclamation act, to be introduced before the Sixty-ninth Congress by Senator McNary of Oregon, will provide one of the livest issues before reclamationists during the next few months. Without entering upon any discussion of the bill, MODERN IRRIGATION has felt it important to give it considerable space in this first issue.

An article by Senator McNary, explaining the principle and purpose of the bill, appears in the front editorial section. The proposed bill itself is printed in our department devoted to Reclamation.

Senator McNary was born on a farm near Salem, Oregon, which city is still his home, and throughout his life has been in close touch with the problems indigenous to the soil and water resources of the west. He has been a member of the United States Senate since 1917, and is chairman of the Senate Committee on Reclamation and Irrigation.

AS SUPERINTENDENT of the Orland Project, R. C. E. Weber, U. S. Bureau of Reclamation, is amply qualified to tell of the progress and success of that enterprise.

Mr. Weber has been identified with the Reclamation Bureau since 1909, and was assigned to the Orland project near the close of that year, serving as superintendent since 1921. He was born in Indiana, in 1885, and is a graduate of Purdue University, School of Civil Engineering. He has had a very creditable career of engineering experience, first in railroad work and later with the United States Forest Service, and the Geological Survey, Technologic Branch.

He has written numerous technical articles for various publications dealing with the construction features of the Orland project.

WHEN a man is in daily contact with the concrete problems of managing an irrigation district or water company, his remarks on the subject are apt to be full of real meat for others engaged in the same line of work. Richard Bard, president of a successful California company, writes a helpful article about some mutual water company problems and how they are being met in his organization, under the department heading of "Irrigation Management."

Mr. Bard is a well known agriculturist on a large scale in Southern California, who has made an enviable reputation in many of the varied departments of modern ranching. The pure-blooded, prize-winning livestock of the Berylwood Ranch, of which Mr. Bard is the active head, is known wherever good animals are appreciated. Mr. Bard is also general manager of the Berylwood Investment Company of Hueneme.

FREDERICK S. MYRTLE, who writes on the relation of electricity and public utilities to the irrigation movement, is editor of *Pacific Service Magazine*, published by the Pacific Gas & Electric Company, one of the leading power companies of the west and one of the world's largest hydro-electric institutions.

Mr. Myrtle is a former newspaper man, who has a record of exceptional service on Hearst publications, and for a number of years has been doing magazine and feature work for the "P. G. & E."

ELWOOD MEAD needs no introduction to an irrigation audience. His position as Commissioner of Reclamation assures any utterance from him a careful reading. in his article on the present status and outlook for reclamation, in this issue, he gives the attitude of the head of the service toward the past, the present, and the future of the national reclamation policy.

A. L. SONDEREGGER, who writes on "The Water Problems of the Valley of Southern California," deals with a subject upon which he is ably qualified to speak. As a consulting engineer, he has specialized in hydraulic engineering in Southern California including municipal water supply and irrigation, since 1906.

Mr. Sonderegger has acted as consulting engineer for a number of cities in Southern California, and for several years was consulting engineer for the receiver of the California Development Company (predecessor to the present Imperial Irrigation District). He has aso been prominent in ground-water litigation and has made extensive studies of groundwater supply, flood control and conservation. He served as a member of the Board of Engineers appointed by the City of Los Angeles in 1924 to report on the available water supply for the city. Mr. Sonderegger has to his credit a large number of technical papers on ground water and flood control.

He is a graduate of the Swiss Institute of Technology at Zurich, a member of the American Society of Civil Engineers and a certified member of the American Association of Engineers. He is also a member of the Board of Editorial Advisors of MODERN IRRIGATION.

B. J. SEGER, who writes on "Adequate Farm Loans for Irrigated Lands," is secretary and treasurer of the North Platte Valley Water Users Association, and of the Farmers' Irrigation District, with headquarters at Scottsbluff, Nebraska. He understands "from the ground up" the problems of which he writes, for he homesteaded under the government project in the North Platte Valley in 1906 and has been an executive of the Water Users' Association for the past fifteen years. This organization includes 1,325 members, and the Farmers' Irrigation District is comprised by 700 land owners.

Mr. Seger has been prominent in the financial and legislative affairs of irrigation in his state for many years. As financial manager of the Farmers' Irrigation District he has secured funds through the sale of warrants and the negotiation of loans to the amount of $1,094,000.00; and as a member of the legislative committee of the state irrigation association has assisted in securing the enactment of a number of progressive irrigation laws, including that enacted by the last session of the Nebraska legislature, which provides that an irrigation district may issue serial bonds to be repaid over a period of fifty years. The new law also provides for funding all indebtedness of the district into a single bond issue.

Mr. Seger's article is based on a paper recently given before the Nebraska State Irrigation Association. The first part of the article, dealing with loans under a new irrigation project, appears in this issue. A discussion of loans under old established projects has been reserved for a later number.

CALIFORNIA irrigators have long been exercised over the poor facilities for display accorded to manufacturers of and dealers in irrigation equipment at the state fair. In the August issue of MODERN IRRIGATION, C. A. Utley, secretary and first president of the Western Irrigation Equipment Association, will discuss this state of affairs in an entertaining and humorous article—which, nevertheless, deals with a subject of genuine importance. Look for "Under the Tattered Canvas" in the next issue; and we shall be greatly surprised if you do not concur heartily with the conclusion adduced therein by Mr. Utley.

THE Portand Cement Association is a national organization—one of several progressive trade associations which have recognized the worth of a service policy based on extending the maximum of gratuitous assistance to agriculturists and to all others who comprise its present and its prospective customers. J. E. Jellick, southwestern district engineer of this organization, has been able, in his article on the use of concrete in irrigation, merely to scratch the surface of this broad subject, and one of the principal benefits which the reader may derive therefrom is the specific information given in regard to the various technical publications issued by the Association, which are available for his use upon request.

Mr. Jellick is in charge of the district comprising Southern California and Arizona, and his office—located at 548 South Spring Street, Los Angeles—is doing a splendid work in helping irrigators who are interested in the uses of concrete in irrigation.

THE BUYERS' GUIDE TO LEADING SUPPLY SOURCES

Listing Practically All Standard Equipment Used in the Irrigation Country

THE IRRIGATION and hydraulic industry has, in the past, been greatly handicapped for the lack of some centralized Bureau of Information. Many jobbers, dealers and manufacturers representatives throughout the irrigation country have considered representation for commercial products of different types but did not know where to locate the names and addresses of the manufacturers of such appliances. The men who do ordering and specifying have not, in many cases, been able to consult an authentic directory of reliable equipment when writing for catalogs or quotations, compiling cost estimates or making out purchase orders. IN SHORT, THERE HAS BEEN NO STANDARD BUYERS GUIDE FOR THE INDUSTRY. It is in order that this need may be met, as adequately as possible, that MODERN IRRIGATION presents this current "Buyer's Guide to Leading Supply Sources," *corrected monthly.* It will, of course, become more complete as the publication grows in size. But since the present advertisers manufacture—or act as selling agents—for virtually all standard types of hydraulic equipment, this department should, at the outset, perform an invaluable service to buyers and sellers alike. The importance to the individual manufacturer of keeping his listings accurate and up-to-the-minute cannot be over-emphasized. Changes and corrections should be forwarded immediately. If any errors or omissions are noted in this month's listings, make sure that such incorrect listing will not appear again by sending your correction or revision by the next return mail. The listings "Main Branches or Agencies" are for branch offices or distributors in the irrigation country only and do not imply, necessarily, that the advertiser does not have branches elsewhere which are not included here.

What do You Need in the Line of

IRRIGATION FITTINGS?

The following "Commercial" fittings and irrigation valves are standard throughout the irrigation country: Long Radius Elbow Butterfly Valves; Long Radius Casing Elbows; Screw Casing Butterfly Valve; Standard Pipe Butterfly Valves; Standard Flanged Butterfly Valves; Ring Flanged Butterfly Valves; Hub End Butterfly Valves for Concrete Pipes; Horizontal or Vertical Swing Check Valves; Flanged, Screw Casing or Standard Pipe; Angle Check Valves, Flanged; Discharge Flap Valves, Screw Casing or Flanged; Flanged and Threaded Increasers; Flanged Taper Pieces; Casing, Standard Pipe, and Riveted Pipe Flanges; Standard and Special Flanged Pipe Fittings.

We are headquarters also for standard well-drilling and hydraulic equipment for general irrigation use.

A typical Armco Flume installation which took the place of wooden flumes in Yolo County, Calif.

Armco Flumes

have solved many an irrigation problem

Irrigation experts recognize their convenience and economy.

The design of Lennon-type Armco Flumes embraces every modern improvement which will add strength, increase carrying capacity and insure long service.

They are easily erected and require very little attention when once installed. And they **last.** The flume sheets are made of Armco Ingot Iron,—the purest rust-resisting iron obtainable, covered with a heavy coating of galvanizing. All metal accessories are electro-galvanized and give equally long service.

Back of these enduring flumes stands the reputation that the California Corrugated Culvert Company has built up over a long period of years by consistently giving honest quality and intelligent service.

Let us send you detailed information and prices.

Very likely our engineers can offer practical suggestions.

Armco Culverts and Calco Gates have long been standard equipment on irrigation and drainage projects. They are made in the same thorough manner and give the same lasting service as Armco Flumes.

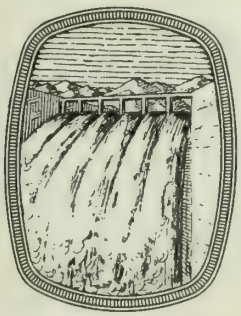
PETROLEUM WORLD 626 S. SPRING ST., LOS ANGELES, CALIF. MODERN IRRIGATION

HUBERT WORK

Secretary of the Interior, who during July visited the national parks and reclamation projects of the northwest, in an endeavor to get face-to-face with his troublous tasks as head of this branch of the government. The sentiments voiced by Secretary Work on reclamation in general, and certain reclamation projects in particular, have made him the storm-center of an editorial deluge of praise and blame in the western states. Some of the comments which his policies have elicited are given on page 22.

MODERN Irrigation
The Magazine of Applied Hydraulics



Volume 1 AUGUST, 1925 Number 2

The Progress *of* Irrigation

MODERN IRRIGATION'S first issue, in the mails to several thousand readers of the irrigation industry the first of July, has set a new precedent in industrial journalism. Its reception has been more than gratifying to the publishers.

A magazine of this kind will not, in the ordinary course of things, sweep the country like a popular song, a best-selling novel, a slang phrase, or cross-word puzzles. Its advance, rather, must be of slow and ordered growth. Consequently, it is a matter for some surprise, as well as gratification, that MODERN IRRIGATION has found an immediate acceptance with so large a proportion of the irrigation field.

A veritable deluge of congratulatory letters and more tangible evidences of approval in the form of subscription checks have been crossing the editorial desk throughout the month. In an early issue there may be space to present a few of these expressions, from representative men of the industry, with a view to showing, not that MODERN IRRIGATION has made many staunch friends by its first appearance, (although that manifestly has been the case), but that these men welcome the institution of such an organ for the real need which it fills.

FOLLOWING hard upon the western tour of William M. Jardine, Secretary of Agriculture, Herbert Hoover, Secretary of Commerce, visited California during July, and Hubert Work, Secretary of the Interior, accompanied by Elwood Mead, Commissioner of Reclamation, was in the northwest during the latter part of June and the early part of July.

Secretary Hoover is a California man and his visits to "the Coast," where he is as much at home as at Washington, may not fairly be exaggerated into matters of political significance; but by the position which Mr. Hoover has attained in the affairs of the nation, it is impossible for him to go anywhere or say anything without that action or expression being carefully scrutinized. During his visit to Southern California, Mr. Hoover was asked for a statement on the always important matter of the Colorado River, and he made, according to the press, a definite declaration in favor of a "high dam" as the proper solution of the major problems involved—at the same time declaring that the interests of all parties

concerned dictate that the controversy around the Colorado River should be settled in some way, and at once, in order that the potentialities which it represents might be, at the earliest date possible, released for the common good.

SECRETARY Work's visit to the northwest has been a curious mixture, if one may judge from newspaper accounts, of cheers and denunciations. With Commissioner Mead he put in a very busy month visiting reclamation projects in Wyoming, Montana, Washington, Oregon and Idaho; and as reclamation is not the only concern of his department, he was obliged to crowd much other business into his trip, such as tours of inspection to the national parks of the northwest.

According to the present reclamation policy of the administration, as evidenced by the statements of the Interior Department, Secretary Work is compelled to discriminate very carefully between the numerous projects which are competing for federal assistance. His tour was largely an attempt to get first-hand information which would allow him to make this discrimination intelligently and judiciously. Consequently, it is natural that those sections which meet with his approval as feasible projects, deserving of encouragement, should look upon his policies with very different feelings than those which impress him less favorably.

Regardless of whether all the policies of the department are wise, Secretary Work's position is obviously an uncomfortable one, and it is not altogether surprising that he has been met with hozannas on the one hand and roundly scored for his actions on the other. An article in another part of this issue records some of the diverse editorial comments that have greeted the secretarial party on its tour.

OPINIONS of the temperamental fitness of Secretary Work to be the head of the Reclamation department of the government are widely contradictory. A personal difference between the Governor of California and the Commissioner of Reclamation has added to the controversial troubles of this Bureau. But it can hardly be denied, by partizans on either side, that the Secretary is doing the wise thing in going to see the reclamation projects at close range.

Rumors of Secretary Work's possible resignation of his present portfolio continue to follow him in spite of his arduous efforts to get better acquainted with this aspect of his job. Secretary Weeks, of the War Department, is a sick man, and Work is mentioned as a possible successor in the event of his resignation. All such reports, however, are officially denied in the Interior Department, and the Secretary himself denies it by continuing his attempts to get a bird's-eye view of reclamation.

THE key contentions of both the Secretary and the Commissioner are that reclamation is more than a matter of getting water on the land; that it is a matter of getting profitable crops and able farmers to use the water, after it is obtained; that the states should co-operate with the federal government in assisting feasible projects; and that settlers who are able to pay the government should not be allowed to evade their obligations.

Pure logic, however, in a situation where so many personal equations are involved, may not be safely pushed to the limit, and no successful solution of the reclamation problem may be obtained without making a nice balance between these rationalistic considerations and the personal needs of settlers already on the land. Abstract feasibility does not seem to them as real or important as the concrete problems which are all about them, and in which they feel entitled to assistance from the same government which encouraged them to undertake their responsibilities.

THAT the people of the west as a whole are convinced of the value of an expanding irrigation program is evidenced, meanwhile, by continued reports of growth. Irrigation, by new bond-issues voted, new projects planned and surveyed, and new irrigation structures completed and dedicated, displays the symptoms of a vigorous financial and physical condition in spite of its isolated failures.

In this single issue there are recorded: a plan for the reclamation of government desert lands by pump irrigation, to be introduced before the next Congress; the completion of the Tieton Dam, in Washington; the approval of a bond issue to complete the Medina Irrigation Project in Texas; the definite declaration of Elwood Mead, Commissioner of Reclamation, that the Kittitas (Wash.) project will go through by one means or another; and greater or lesser developments of the same kind in California, Oregon, Idaho and many other parts of the irrigation country.

Enthusiasts for irrigation, looking over the western horizon, may catch many encouraging signs. The pioneering period of the industry has passed, and while, from many standpoints, the present is a crucial period in its history, it may be confidently anticipated that the lessons of the past will not have been in vain, and that the collective wisdom of irrigationists will be able to work out a sure salvation.

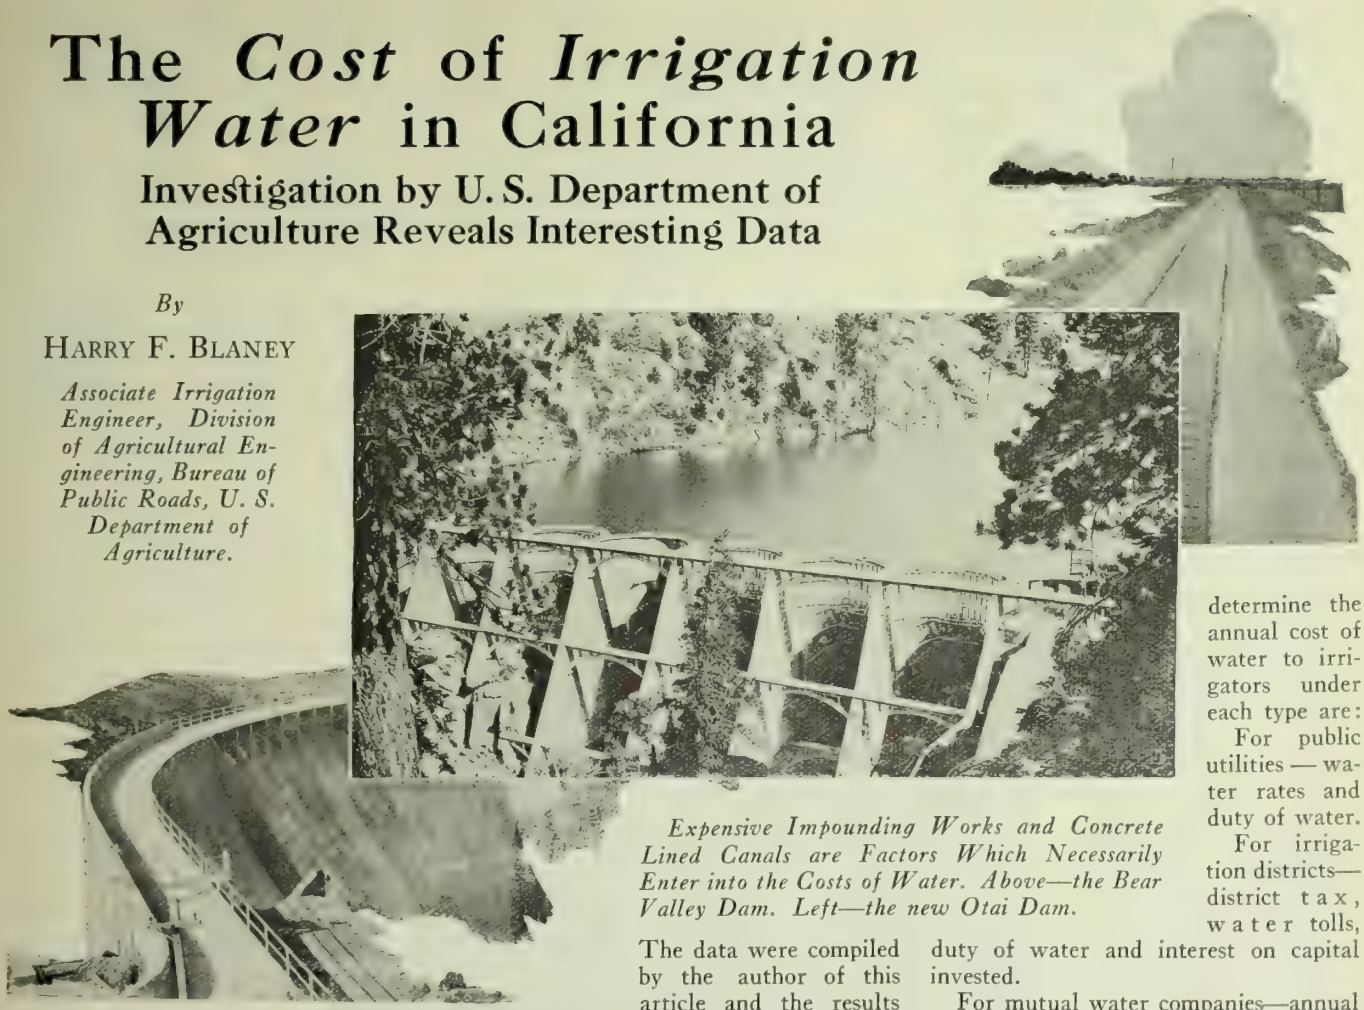
The *Cost* of *Irrigation Water* in California

Investigation by U. S. Department of Agriculture Reveals Interesting Data

By

HARRY F. BLANEY

Associate Irrigation Engineer, Division of Agricultural Engineering, Bureau of Public Roads, U. S. Department of Agriculture.



Expensive Impounding Works and Concrete Lined Canals are Factors Which Necessarily Enter into the Costs of Water. Above—the Bear Valley Dam. Left—the new Otai Dam.

IRRIGATION water yearly is becoming of higher value and more difficult to obtain; in consideration of which fact bankers, investors, government officials, engineers and farmers may well ask what expenditure can be justified to develop a water supply on land suitable for growing high-grade crops, and what water charge can such land pay. Farmers and prospective farmers are in need of such cost data as will enable them to choose crops that may be grown profitably under existing water charges.

The costs of irrigation water to the farmer in the pioneer days were generally a minor factor in his total annual expenditures. Today, however, the annual cost of irrigation water may, in many cases, be the determining factor as to whether or not the enterprise is feasible for any but high-priced crops.

The Division of Agricultural Engineering of the United States Department of Agriculture, the Department of Public Works of California, and the California Agricultural Experiment Station have co-operated in a field study of the cost of irrigation water in California. The data were compiled by the author of this article and the results published as a state bulletin under the title, "Cost of Water to Irrigators in California." As only a limited number of copies were printed, this article, substantially a digest of the report, has been prepared as of interest to many irrigators who have not had access to the bulletin.

IN CALIFORNIA many types of enterprises may furnish irrigation water. However, most of them may be placed under one of four classifications: public utilities, irrigation districts, mutual water companies, or private pumping plants. Data on a total of nearly 200 public utility water companies, irrigation districts and mutual water companies, and 72 private pumping plants were obtained throughout California. In addition to annual cost of water, information on the type of irrigation system, locality, age, source of water, acreage irrigated, kind of crops, capital invested, and water charges were compiled and summarized in tables.

Cost data for these types of enterprises are not always comparable, as their forms of organization and the items entering into the cost of irrigation water are different. The principal factors that determine the annual cost of water to irrigators under each type are:

For public utilities — water rates and duty of water.

For irrigation districts—district tax, water tolls, duty of water and interest on capital invested.

For mutual water companies—annual assessments, water rate, duty of water and interest on capital stock.

For private pumping plants—cost of power, attendance and all fixed charges.

COMPARISONS between two systems of the same type of enterprise are often difficult to make because factors affecting the cost of water have a wide range of variation. For example some projects deliver water to every 10 acres, others to every 160 acres, leaving the farmers to take care of the remaining distribution system. In some systems where gravity water is depended upon without storage, the irrigator supplements this supply by a private pumping plant to tide over a dry season and thus adds to his regular irrigation charges.

One project may have expensive storage reservoirs, diversion works, pumping plants, or a concrete pipe or lined canal distribution system while another will depend entirely on unstored gravity water with unlined ditches. The irrigator should weigh such facts carefully before coming to the conclusion that he is paying too much for water in comparison with other projects.

Some idea of the variation of the annual cost of irrigation water may be

obtained from the following tables which summarize the costs under each type of enterprise for different sections of the state.

TABLE 1—SUMMARY OF ANNUAL COST OF WATER UNDER PUBLIC UTILITIES

	Cost of water including interest on capital invested			
	Per acre		Per acre-foot	
Section of Calif.	Min.	Max.	Min.	Max.
Northern	$1.51	$12.00	$ .92	$ 6.01
Central	.56	5.64	.30	4.24
Southern	5.54	32.67	1.85	25.14
Entire State	.56	32.67	.30	25.14

Practically all the water used under the public utilities in Northern California is gravity, with some storage. In Central California, where the cheapest water is found, it is all gravity with very little storage. In Southern California the high rates are due either to expensive storage works for gravity water, cost of pumping water, or costly distribution systems on account of the scarcity of water.

TABLE 2—SUMMARY OF ANNUAL COST OF WATER UNDER IRRIGATION DISTRICTS

	Cost of water including interest on retired bonds			
	Per acre		Per acre-foot	
Section of Calif.	Min.	Max.	Min.	Max.
Northern	$3.28	$12.00	$ .37	$18.00
Central	.90	24.69	.53	16.35
Southern	4.04	21.00	2.66	22.19
Entire State	.90	24.69	.37	22.19

The lowest annual cost of $0.90 per acre is for a system which depends on gravity water without storage. Most of the crops that need water after July 15 are irrigated by private pumping plants and the cost of this irrigation is not shown. On the other hand, the highest cost of $24.69 is under a district where all the water is pumped through an average lift of about 300 feet, the distribution system consisting of steel, redwood and concrete pipe and the average cost of litigation, for the past two years, being about $5.00 per acre. These two illustrations will give some idea of the reasons for the wide variations in costs per acre among the different districts.

TABLE 3—SUMMARY OF ANNUAL COST OF WATER UNDER MUTUAL WATER COMPANIES

	Annual cost of water including interest on capital invested			
	Per acre		Per acre-foot	
Section of Calif.	Min.	Max.	Min.	Max.
Northern	$1.84	$13.67	$ .55	$ 7.82
Central	.83	36.17	.40	27.44
Southern	2.07	60.07	1.22	50.91
Entire State	.83	60.07	.40	50.91

The cheapest water is supplied by the older gravity systems, some of which were constructed in the early fifties. Some are capitalized at a few dollars per acre, which does not represent the true present value of the water. In the absence of proper basis for interest charges the main expense under them consists of fees paid to the zanjeros. In a few instances, the farmers do most of the work themselves.

The lowest cost per acre is for a system using 1.68 acre-feet of water per acre. This cost per acre is made up of interest, $0.17, and an average annual assessment of $0.83, from which is deducted $0.17 for sinking fund, leaving a total cost per acre of $0.83. The lowest cost of $0.40 per acre-foot is for a company having the following items of cost per acre of water: interest of $0.41 and average assessment of $0.71, from which is deducted $0.20 for sinking fund, leaving a total per-acre cost of $0.92. This, divided by the duty of water of 2.30 acre-feet per acre for the system, gives a cost of $0.40 per acre-foot.

For the entire state, the highest costs are found under systems which pump all their water, although there are some gravity systems in Southern California that have higher costs than many pumping systems.

TABLE 4—SUMMARY OF ANNUAL COST OF WATER FOR PRIVATE ELECTRIC PUMPING PLANTS

	Annual cost of water including fixed charges					
Location	Per acre-foot		Per acre		Per acre-foot Per foot lift	
	Min.	Max.	Min.	Max.	Min.	Max.
Sacramento Valley	$2.81	$55.31	$3.01	$45.63	$ .065	$1.317
Santa Clara Valley	4.04	56.34	5.34	33.08	.125	.378
San Joaquin Valley	1.56	18.42	6.96	48.08	.040	.301

The figures given for the private pumping plants in the Santa Clara and San Joaquin Valleys are for 1923, while all other data are for the year 1922. In the Sacramento Valley the lifts ranged from 30 feet to 73 feet; in the Santa Clara Valley from 29 feet to 208 feet; while in the San Joaquin Valley the lowest lift was 10.5 feet and the highest 249.9 feet.

IT IS difficult to make very accurate comparisons of the cost of irrigation water according to crops grown, because most systems furnish water to more than one kind of crop, and very few keep records that would make this possible. However, tables 5, 6, and 7, appearing on this page, give some indications of the variations in costs for citrus trees, deciduous trees and vines, and alfalfa under different types of enterprises in California.

The increasing cost of water calls for the greater economy in its use by the irrigator. Many irrigation systems have reduced their overhead expenses to a minimum. However, in some localities there is little inducement for the irrigator to use water economically, as no measurements are made, and the water is paid for at a flat rate regardless of the amount used.

Many farmers do not utilize their pumping plants fully. Either the

(*Continued on Page 28*)

TABLE 5—SUMMARY OF ANNUAL COST OF WATER FOR CITRUS TREES

	Min.	Max.	Min.	Max.
Public Utilities	$ 5.00	$32.67	$1.47	$25.14
Irrigation Districts	.90	24.69	.60	16.35
Mutual Water Companies	1.84	60.07	.55	50.91
Private Pumping Plants[1]	16.22	48.08	4.21	18.42

[1]Figures given for private pumping plants in Table 5 are not comparable with other enterprises as they represent only a few plants in San Joaquin Valley and are for 1923.

TABLE 6—SUMMARY OF ANNUAL COST OF WATER FOR DECIDUOUS TREES AND VINES

	Annual cost of Irrigation Water			
Type of Enterprise	Per acre		Per acre-foot	
	Min.	Max.	Min.	Max.
Public Utilities	$ .56	$25.14	$ .30	$25.14
Irrigation Districts	.90	24.69	.53	22.19
Mutual Water Companies	.83	41.28	.40	27.67
Private Pumping Plants[2]	5.34	33.08	4.04	56.34

[2]Figures shown for private pumping plants in Table 6 are for Santa Clara Valley in 1923 and are not comparable with other enterprises.

TABLE 7—SUMMARY OF ANNUAL COST OF WATER FOR ALFALFA

	Annual cost of Irrigation Water			
Type of Enterprise	Per acre		Per acre-foot	
	Min.	Max.	Min.	Max.
Public Utilities	$ .56	$25.14	$ .30	$25.14
Irrigation Districts	.90	21.00	.53	8.90
Mutual Water Companies	.83	41.28	.40	16.82
Private Pumping Plants[3]	9.53	45.63	2.91	19.09

Type of Enterprise	Annual cost of Irrigation Water Per acre	Per acre-foot

[3]Figures for private pumping plants in Table 7 are for seventeen tested pumping plants in the Sacramento Valley and are not comparable with other enterprises.

How the Tractor May Serve the Irrigator as a Valuable Source of *Dual-Purpose* Power

On Many Smaller Ranches it is Proving Itself a Satisfactory Power Plant for Varied Uses

By ARNOLD P. YERKES

IT IS very true that "good equipment makes a good farmer better," but even the best equipment cannot earn money when it is idle. The more steadily equipment of any kind can be kept at profitable work, the greater the amount of money it will earn.

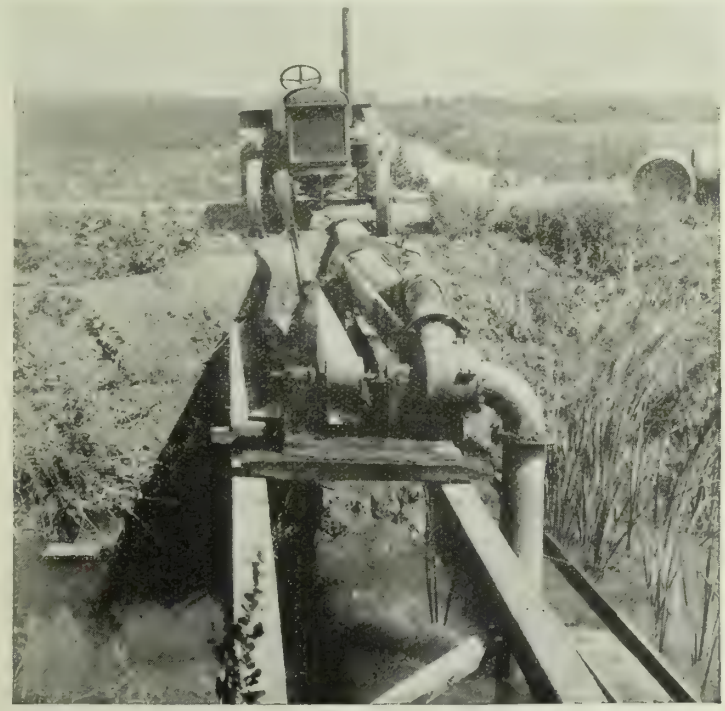
In the industrial world, the competent manufacturer realizes this fact and strives to keep his equipment, especially the machines which represent a considerable investment, busy at profitable work as great a share of the time as can possibly be done. Machines which were bought for one particular purpose are frequently used for other jobs in order to keep them earning instead of standing idle when there is no work for them at their regular tasks.

What is good practice for a manufacturer is, generally speaking, good practice for a farmer, for there are many things in common between a well managed factory and a well managed farm.

ALL of which leads up to the point it is desired to make—that the tractor lends itself particularly well to a large amount of profitable work each year on an irrigated farm where it can be used not only for a great many kinds of field work, such as plowing, cultivating, leveling, ditching, road grading, ditch-cleaning, chiseling, etc., but for pumping water as well.

Of course, on the larger irrigated ranches the ordinary farm tractor can scarcely be considered a practical power plant for pumping, except as an auxiliary. On many smaller ranches, however, the heavy investment required for the large pumping plants, which are commonly found on the big ranches, is beyond the means of the owner or tenant, and here the farm tractor, in the larger sizes, has proved a very satisfactory and economical dual-purpose power plant.

One of the most valuable features of the tractor in such cases is its comparatively low cost. Usually a special engine for pumping purposes, with a power capacity equal to that of the larger farm tractors, will cost considerably more than the latter and will, of course, pump no more water in a given period. Inasmuch as it will be necessary for the operator to have power of some kind for his field work as well as for his pumping, if he can make one set of equipment do both jobs, he has at the outset saved the expenditure of a considerable sum of money.



THE TRACTOR LENDS ITSELF TO A WIDE VARIETY OF TASKS ON THE IRRIGATED FARM. THIS ONE IS DRIVING A 6-INCH PUMP, DISCHARGING INTO AN 8-INCH PIPE.

Then, since utilizing the single power plant at several jobs will lengthen its working season each year, its earning capacity is likewise greatly increased; so he is making two worth-while savings by this practice, to say nothing of the additional advantages of having only one machine to learn to operate and to require repairs.

EVEN in the not uncommon case where a tractor which is capable of doing all the field work on a ranch is not capable of pumping enough water for the acreage under cultivation and it is necessary to buy a second tractor, the total investment is still not as great as though one large power plant and a tractor had been purchased, and the the second tractor will be of real value for emergency field work if the other breaks down, or at times when it is desirable to rush the work of cultivation faster than one tractor is capable of doing it.

Since pumping water for irrigation is hard and continuous work, it is always advisable to exercise considerable judgment in buying and installing the pumping plant, so as to insure getting one which the tractor can operate satisfactorily. The average farmer usually does not have the necessary information at hand from which to calculate the proper size of pump, pulleys, etc. The safest procedure in such cases will usually be to write the agricultural engineer at the state college or to the engineering department of the company which built the tractor, giving all the necessary information such as the height of the lift, length of the horizontal pipe, the model and rating of the tractor, etc.

It is usually advisable to obtain a pumping outfit which will normally require a trifle under the engine's capacity, inasmuch as it is difficult to keep an internal combustion engine operating at 100 per cent efficiency at all times. Worn rings, leaky valves, and other causes of lost power which may develop during continuous operation will then not interfere so quickly with the satisfactory operation of the pump. It is true, too, as every automobile owner knows, that operating troubles are much less frequent

(*Continued on Page 31*)

Will Government *Desert Lands* be Made Fruitful by a System of Pump Irrigation?

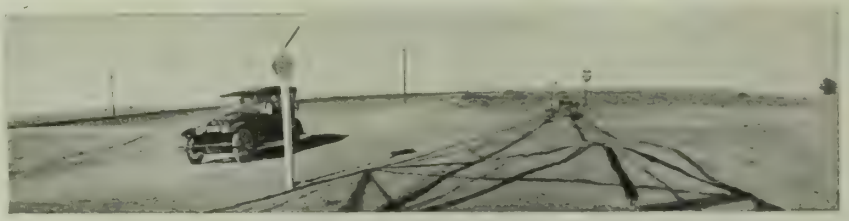
Land Office Official Outlines Plan for Reclaiming Arid Acres, to Begin With the Mojave Desert

By BRAINERD B. SMITH

Register, U. S. Land Office at Los Angeles

MUCH has been written, both in fiction and in fact, about the Great American Desert, which seems to hold, for most people, a mysterious charm.

We have seen the mountains and hills, that rise out of these deserts, bring forth their treasures of gold, silver, and other precious metals; we have seen the flat "dry lake" areas produce salt, potash, borax and many other useful minerals; and we have seen the homesteader and other land settlers come, put in a few weary years, and go—whipped for the lack of water. The abandoned and dilapidated shacks that dot the desert give mute evidence of the land settlers' losing conflict with nature.



ABOVE—A TYPICAL MOJAVE DESERT VISTA; THE ONLY SHADE IS THAT CAST BY THE STEEL TOWER OF A HIGH VOLTAGE ELECTRIC POWER LINE. BELOW—THE DESERT RECLAIMED. AN ALMOND ORCHARD ON IRRIGATED "DESERT" LAND (NORMAN F. MARSH RANCH NEAR HESPERIA).

The history of the western migration of the American people is most interesting. The desire in the hearts of a great many people to own a "piece of land" has, in the last century, exhausted the government lands in fertile valleys and practically all other lands upon which water could be easily placed. The U. S. Reclamation Service has reclaimed thousands of acres of arid lands by diverting rivers and streams for irrigation, and the land seeker has settled these lands.

We are now, therefore, becoming concerned with those desert areas situated where there are no rivers or streams from which water can be diverted for irrigation, and where the average rainfall is not sufficient to mature crops. It is these vast areas that make up the bulk of the remaining vacant government land, and it is upon these lands that future generations must settle.

WHERE, and how, are we going to get the water to irrigate these desert areas, where the average annual precipitation is less than six inches? We have spoken of the failures on account of the lack of water, and we are endeavoring, at the present, to work out a practicable plan whereby some portion of these deserts can be brought under successful cultivation. Our desire is to make it possible for the homesteader to remain on his land after he has settled there.

But the only water that is available to irrigate these deserts lies beneath them, and these ground waters must be pumped to the surface if the lands are ever to be cultivated.

The average homesteader cannot finance himself sufficiently to drill wells that will supply water for adequate irrigation; very large tracts of land cannot be purchased from the government, so that private interests may develop them; and the greater portion of these desert lands are the property of the United States. It seems reasonable, then, to the writer, at least, that if the wells are ever to be drilled the government will be required to drill them for the benefit of the homesteader.

UNITED States Senator Samuel M. Shortridge and the writer have gone over considerable data in considering the feasibility of systematically drilling wells in the desert areas. Many of these areas are far removed from ready markets, and so situated that it would be difficult for a land settler to dispose of his crops. Such areas cannot, therefore, be considered for development at this time. In the seven far western states there are approximately 135,000,000 acres of vacant government land. Statistics are not available for determining what exact portion of this vast area is desert in character, but an inspection of the maps would indicate that more than half of the entire area, or about 70,000,000 acres, can be classified as desert lands. We are designating as "desert lands" those broad, level or gently sloping arid lands found in the western United States.

A small proportion of this 70,000,000 acres, located near rivers and streams, will be reclaimed by diverting water to the land, but the larger proportion is left, and demands consideration.

THE problem of bringing under cultivation these desert areas that are to be irrigated by pumping water from wells must be considered in a practical manner. By a process of elimination, having in view those areas best suited for the first project of pump irrigation, the Mojave Desert has been selected as the most feasible.

(*Continued on Page 41*)

LOUIS C. HILL

CARL E. GRUNSKY

ARTHUR P. DAVIS

Engineering Ably Represented on Modern Irrigation's *Board of Advisors*

SEVEN members of the Board of Advisors of MODERN IRRIGATION were introduced in the first number, by reproduction of their portraits and short summaries of their careers as they have had to do with irrigation. These comprised the agricultural and conservation groups of the Board.

In this issue seven more members are presented — those who constitute the group which, out of a total present membership of some thirty individuals, will probably exert the most definite influence in shaping the editorial contents of the magazine. They are the engineers, and they represent and typify the most eminent skill and the most successful experience of the profession.

These men have agreed to give MODERN IRRIGATION the benefit of their broad-range perspective of the technical advance of irrigation, and, by their counsel, to guide it in such paths that the magazine may serve the engineers and technicians of the industry to maximum advantage. Assurance that the advisory work of this department will be done by experts may be gained from a perusal of the following outline of their experience in the fields of reclamation and irrigation.

The place held by Arthur P. Davis in engineering is best told by a matter-of-fact recital of the tasks to which he has devoted the past forty years. From 1882 to 1894 he was connected with the Geological Survey, first as topographer and later in government irrigation surveys and stream measurements. From 1897 to 1901 he was engaged in making surveys in charge of all hydrologic work for proposed interoceanic canals in Nicaragua and Panama. From 1902 to 1923 he was identified with the Reclamation Service, first as assistant chief engineer, then as chief engineer and finally, from 1914 to 1923, as Director of the service.

During this time his skill was frequently called into service by important projects outside of the Reclamation Service. He was a member of the Board of Consulting Engineers on the Panama Canal and consulting engineer on hydraulic works in Porto Rico; he investigated irrigation projects in Turkestan at the request of the Russian Government; was named on a committee to study Panama Canal slides by the National Academy of Sciences; went to China for the Red Cross to study flood conditions; and was consulting engineer on high dams in many parts of the United States, in Mexico and Alaska.

In 1923 Dr. Davis was named Technical Advisor of a Commission for the adjustment of pecuniary claims between the United States and Great Britain. In 1922 and 1924 he was a lecturer on Hydraulics at Yale University, and is now chief engineer and general manager of the East Bay Municipal Utility District, of Oakland, California, where he lives. Among the degrees and honors conferred upon him are the degrees of Bachelor and Doctor of Sciences, from George Washington University, and Doctor of Engineering, from Iowa College. In 1920 he was president of the American Society of Civil Engineers, and is now a member of its Board of Direction.

CARL E. GRUNSKY is also a past president of the American Society of Civil Engineers, having held that position in 1924. He began his professional career with the state engineering department of California in 1878, and was connected with the state service for ten years, successively as topographer, assistant, and chief assistant. In 1888 and 1889 he was engaged in private practice at Sacramento and later at San Francisco, dealing largely with irrigation and sewerage problems. During the following several years he was a member of the California Examining Commission of Rivers and Harbors, (1889-90); consulting engineer to the Commission of Public Works, (1893-95) a member of the San Francisco Sewerage Commission, (1892-93); City Engineer of San Francisco, (1900-04); a member of the Isthmian Canal Commission appointed by President Roosevelt, (1904-05); consulting engineer in the U. S. Reclama-

A. L. SONDEREGGER

tion Service and advisor to the Secretary of the Interior, (1905-07).

For a short time Dr. Grunsky was in private practice in New York, and later in San Francisco, where he is now senior member of the C. E. Grunsky Company, engineers.

Dr. Grunsky is a native Californian, born in San Joaquin County. His higher education was obtained in Europe. He holds the degree of Dr. Ing., from the Polytechnicum Stuttgart, Germany, of which he is an alumnus, and that of Eng. Dr. from Renssaeler, granted in 1924. Other honors which have been conferred upon him include the presidency of the California Academy of Sciences and the Pacific Division of the American Association for the Advancement of Science.

LOUIS C. HILL, a member of the firm of Quinton, Code & Hill, Consulting Engineers of Los Angeles, has been actively engaged on many varied and important projects pertaining to irrigation and hydraulic developments.

His training was received at the University of Michigan, from which he was graduated in 1886, with the degree of Bachelor of Science in Civil Engineering and later the degree of Bachelor of Science in Electrical Engineering. The honorary degree of Master of Engineering was conferred on him in 1911. He is a member of the American Society of Civil Engineers and of Tau Beta Pi.

Until 1903 he was professor of hydraulics and electrical engineering at the Colorado School of Mines, when he resigned to accept a position as engineer in the newly organized Reclamation Service of the United States. He was soon made Project Engineer of the Salt River Project where his work included complete supervision of construction of the Roosevelt Dam and allied works. Two years later, he was appointed Supervising Engineer over all the United States Reclamation Service Projects in the entire Southwest, his duties requiring close supervision of the construction of the Laguna Dam on the Colorado River, of the Elephant Butte Dam on the Rio Grande, and of the tunnel and dam of the Strawberry Project in Utah, as well as various other reclamation projects.

In 1914 he left the Reclamation Service to enter private practice, although retained by the Government as Consulting Engineer to the present time. Among the larger works upon which he has

EDWARD HYATT, JR.

been engaged since entering private practice are the irrigation development of the Goodyear Tire & Rubber Company's lands in the Salt River Valley, Arizona, the Gibraltar Dam for the City of Santa Barbara, the proposed Madera Dam on the San Joaquin River, and the 990,000 acre irrigation project on the Yaqui River in Sonora, Mexico. He has been connected with various municipal water supply problems, having served the City of Los Angeles as one of a board of three appointed for consideration of the City's water supply requirements, and also the proposed dam for Stockton, California.

A. L. Sonderegger is one of Southern California's best known engineers, and is known particularly as an authority on ground-water problems in the irrigation country. As a consulting engineer, he has specialized in hydraulic engineering, having been established for the past twenty years in Los Angeles. His experience has included varied contacts with all aspects of both municipal and irrigation water problems.

Mr. Sonderegger has acted as consulting engineer for a number of cities in Southern California, and for several years was consulting engineer for the receiver of the California Development Company (predecessor to the present Imperial Irrigation District). He has also been prominent in ground-water litigation and has made extensive studies of groundwater supply, flood control and conservation. He served as a member of the Board of Engineers appointed by the City of Los Angeles in 1924 to report on the available water supply for the city. Mr. Sonderegger has to his credit a large number of technical papers on ground water and flood control.

He is a graduate of the Swiss Institute of Technology at Zurich, a member of the American Society of Civil Engineers and a certified member of the American Association of Engineers.

W. F. McCLURE'S official position as Director of Public Works and State Engineer of California would be sufficient to establish his right to a place in a representative group of this kind, entirely apart from his own wide experience and signal success in the profession, but of course he would never have attained the former without the latter. His relation to engineering in general and to irrigation is told briefly in the following comment from a recent issue of the Sacramento *Union*:

(*Continued on Page 28*)

R. V. MEIKLE

Baxter passed the hot-dog stand, and the merry-go-round, and finally came to the "Machinery Building," behind the "Crazy-House." The white tent at the left is the object of his search.

Under the Tattered Canvas

The Story of John Baxter's Search for the Machinery Building at the State Fair

By C. A. UTLEY

"I SUPPOSE that's probably the Machinery Building," John Baxter told his wife, as they entered the State Fair Grounds at Sacramento. He pointed to a large, brick building about two blocks down the main entrance street. "I'm more interested in what's in that building than all of the other exhibits put together, but what do you say we look into a few of these tents and smaller buildings, on the way over?"

The Baxters—typical "dirt-farmers" of the younger generation—had moved from Iowa to California, a few months before the opening of the State Fair and were visiting the fair for the one purpose of looking over the display of farm machinery. John Baxter had graduated from the College of Agriculture, at Ames, Iowa, and Mrs. Baxter was not far behind him in up-to-date knowledge of the feminine side of agriculture. The attractive advertising appeals of the Californians, Inc., Southern California All-Year Club, and the Los Angeles Chamber of Commerce had finally pried them loose from their native soil and here they were in California.

Mr. Baxter was a very methodical man. Before purchasing the eighty acres which he now owned, he had enlisted the services of the best soil experts from the College of Agriculture, at Davis, had satisfied himself that a plentiful supply of pumping water, at a proper distance from the surface, was available; in short he was entering into a business which, if properly planned, was sure to be a success.

AFTER the electric power company had installed their transformers near his partially completed house, his troubles began. He was literally besieged with pump and machinery salesmen by the score. Each one gave him advice just a little different from the others. Hence his decision to spend a day at the State Fair, looking over the various types of pumps, motors, etc., where he could see each one demonstrated in the State Fair testing laboratory.

They turned into a tent at their left and were surprised to find that it contained nearly a hundred thousand dollars worth of automobiles. "Strange," commented Mr. Baxter, "that such valuable stuff should not be housed in a building instead of a tent. Well, I suppose the best buildings are used to exhibit pumping equipment and farm machinery, since this state boasts that it leads the world in the use of irrigation and other kinds of machinery."

"Forget about that wonderful pump exhibit for awhile," Mrs. Baxter replied, "and let's go into this building. I can see an electric refrigerator just inside the door. Maybe they will be exhibiting pumps in here."

John Baxter gave his wife a superior smile and mumbled something about her having no idea of the magnitude of a machinery building suitable for a state like California. "You've been through machinery buildings at other state fairs often enough to know that an up-to-date state like California wouldn't exhibit farm machinery in a woodshed," he said.

Mr. Baxter remembered hearing a lecturer from the Division of Agricultural Engineering, at Davis, who had proudly stated that ninety per cent of the farm work in California was done by machinery, a large percentage of which was electrically operated.

After looking over the exhibits in the "Manufacturers Building," the greater part of which was housed in a tent, annexed to the rear end of the building, they emerged from the side entrance of the tent and were headed once more toward the big brick building.

"Oh! let's go in here," Mrs. Baxter said, "I think it's the School Exhibit which I've been told is worth seeing. We've plenty of time to see everything as we come to it, then you can spend all afternoon in your machinery building, while I look at the poultry and other things that I'm interested in."

MR. BAXTER allowed himself to be veered from his straight course to the brick building, after looking hesitatingly at his watch. "All right," he said, "I guess a half a day ought to be enough to see most of the machinery exhibits."

In walking through the School Exhibits Building, Mr. Baxter noticed a lot of pipes in the unfinished top of the building and, upon inquiry, was told that this building formerly housed the irrigation equipment. A look of incredulity passed quickly over Mr. Baxter's face, but he thought, "Oh well, a small building like this would soon be outgrown; no doubt the machinery manufacturers were

glad to get out of this little box."

Mrs. Baxter forgot about the poultry building and accompanied Mr. Baxter across the green lawn, on the way to the entrance to the main building.

"Just get this artistic view," Mr. Baxter exclaimed, as they were walking across the lawn. "On the left is a small, but artistic building, directly in front is Machinery Hall, and if there were only a nice building of some kind on the right, to shut out the view of those sheds, it would be a scene for an artist to paint. It's certainly appropriate that a great state like California should recognize the foundation of its prosperity and give first place at the State Fair to irrigation equipment and farm machinery, for it's not hard to visualize just what California would look like were it not for irrigation. Remember the old cistern pump we had in Iowa? Now it's automatic pressure systems, overhead sprinklers, underground concrete pipe—"

"John dear, that's all interesting enough but let's go in and *see* these things instead of standing here in the sun," Mrs. Baxter said.

AS they entered the big building they saw at once that it did *not* contain machinery. Apples, prunes, pumpkins—in fact every thing that could be grown out of the soil—was piled high in artistic profusion. The many interesting exhibits in the building made Mr. Baxter forget all about his interest in irrigation equipment for a time. Attendants at all of the booths assured the Baxters that proper irrigation was responsible for all of the wonders before their eyes.

Finally after looking through the beautiful California Fish and Game Exhibit, exhibits from nearly every county in the state, electric range demonstrations, et cetera, Mr. Baxter was now firmly decided that he would find the irrigation equipment exhibit.

As they left the main entrance, Mr. Baxter inquired of a stranger where the machinery building was located. The stranger was not sure but he thought that it was one of those little buildings about a block south of the big building. Mrs. Baxter balked, at this point, and arranged to meet her housband later in the Fine Arts Building, where, she had been told, were plenty of comfortable chairs.

Mr. Baxter was getting somewhat weary but he was determined now, more than ever, that he would find the Machinery Building.

On arriving at the small buildings, which had been pointed out by the stranger, he found them to be horse stables and was directed by a jockey to the extreme north end of the grounds, where, the jockey said, he had seen some pumps in a box car on the spur track. This did not sound very encouraging, particularly since Mr. Baxter thought he detected a faint smile on the face of his informant when mention was made of the "Machinery Building." However, he mopped the perspiration from his face and started in the direction which the jockey had pointed out.

After what seemed to be an endless walk, Mr. Baxter arrived at the north end of the grounds, where he found several small sheds which were used to house hogs and sheep. Repeating the same inquiry to one of the attendants in

A CORNER OF THE "PUMP-TENT"

the hog-sheds, he was directed to the Secretary's office, which, he was told, was located in the big, brick building. Mr. Baxter was hardly in a mood to thank his second informant, and muttering something under his breath, he retraced his steps in quest of the Secretary's office, which was easily found.

As he paused inside of the door, he was met by the genial Superintendent of Exhibits, who, after listening to Mr. Baxter's rather peevish recital of his unsuccessful efforts to find the irrigation equipment exhibit, took him by the arm, led him out of the back door, past a "hot-dog" stand and pointing down a dusty street, said, "See that hot-dog stand at the corner of that shed? Well, you go down there, turn to your left to an orangeade stand, then turn to your right, past the merry-go-round and 'crazy-house' and you'll find the pump-tent."

"Pump-tent," mechanically repeated Mr. Baxter.

"Oh well, they call it the pump tent," the Superintendent of Exhibits explained, "but that's where all of the irrigation equipment is exhibited and everybody calls it the 'pump-tent' for short."

MR. BAXTER headed for the "hot-dog" stand, as directed, made his way through the procession of horses and cattle that were led out for display, past the "crazy-house," and at last found the "pump-tent." He stopped for a moment to get his bearings; looked back at the dome of the big, brick building, which was discernible over the top of the merry-go-round, and turned to enter the "pump-tent." In doing so, he caught his foot in one of the tent ropes and plunged headlong into the mud, which was covered with a thin sprinkling of rice hulls to give it an appearance of respectability.

Thus far Mr. Baxter had not lost his temper, but as he picked himself out of the mud, some of the nearby pump exhibitors who were lounging in front of their empty exhibits, heard some choice "cuss" words. Scraping the mud from his elbows, Mr. Baxter hurriedly took in the situation at a glance, turned to leave the tent, then remembering what he had come to see, decided to see the irrigation equipment exhibit as quickly as possible.

Stopping in front of the first exhibit on the right, he saw a pump which was delivering about a third of a stream of water. Upon inquiry, he was told by the attendant in charge of that exhibit, that the wind, that morning, had blown off a piece of the rotten tent and that that portion of what should be a partial covering for the irrigation equipment, was now in his pump, hence the diminutive stream of water, accompanied by the grinding sounds from the pump.

As he walked around the tent, Mr. Baxter was unfavorably impressed by the sameness of the whole exhibit, inasmuch as every pump was operating as if in a treadmill, lifting the water about two feet and discharging it back into the pit—to be lifted again the same two feet and discharged back into the pit, ad infinitum. "So this is the Machinery Building," growled Mr. Baxter to himself as he left, brushing the dried mud off his knees. He glanced into the tractor tent as he was leaving but didn't go in. He had seen enough.

He presented a forlorn appearance as he walked into the lounging room of the Fine Arts Building, where his wife was waiting for him.

"Why John," Mrs. Baxter gasped, as she saw his disheveled appearance, "have you met with an accident?"

"I've been through the machinery building," Mr. Baxter replied, with an expression on his face which told Mrs. Baxter the whole story. "Let's go home!"

THIS HILLSIDE HAS BEEN DENUDED—THE RESULTS TO IRRIGATION ARE NOT DIFFICULT TO IMAGINE.

What *Conservation* Means to *You*—and to *Irrigation*

By FRANCIS CUTTLE

President, Water Conservation Association

WHETHER he be *interested*, or not, every individual is affected by the question of the conservation of our natural resources. Even a cursory examination of this question will convince the most casual observer that all industry, commerce and trade are, in the last analysis, dependent upon the natural resources of the country. Indeed, it is claimed, on highly competent authority, that the conservation of our forests and our water resources is absolutely necessary to the prosperity of the country. It may not be too much to say that without our forests, poverty and distress would soon follow; for history shows that depopulation follows deforestation as night follows day.

The forests of the United States originally were so vast in extent and variety, and so abundant, that they were accepted as something that might be used and abused without let or hindrance and without thought of dire consequences. In fact, the idea seems to have become fixed in the minds of the people at large that these forests are inexhaustible; that no more care need be taken of them, to secure their perpetuation, than is taken to perpetuate the light and heat of the sun or the air that we breathe.

IN THE PATH OF THE DESTROYER

— PHOTO BY U. S. FOREST SERVICE

The stripping of vast areas for the upbuilding of towns and cities as population increased was hailed as evidence of progress and development. The destruction of large areas by fire was only decried and dreaded as these fires menaced the homes and lives of any particular section, which then, of course, became alarmed; but with the passing of the fire, or if these fires were at some distance, the resultant property destruction was dismissed as of no interest or consequence.

UNFORTUNATELY the idea that our forests are "inexhaustible" is still firmly fixed in the minds of many people and may be ascribed as the reason for the terrible apathy and inertia of the public when called upon to take any action to prevent their destruction or steps to insure their perpetuation.

The original virgin forested area of this country has dwindled from 822,000,000 acres to about 135,000,000 acres and we are now cutting and destroying our remaining supply from four to six times as fast as it is being produced. The remaining virgin supply cannot last more than 15 to 20 years at the present rate of production and consumption, and it takes from 125 to 175 years to grow a tree to saw-timber size (under very favorable conditions of soil and moisture trees have been grown to about one foot in diameter in 65 years, but this is far above the average).

WHAT, then is to become of this country in the interim from the time of the depletion of our timber supply until a new supply can be grown? Read the answer in the history of the countries which already have lost their population, notably Northern Syria, and you will find that the claim that depopulation follows deforestation has been complete.

While we are a strong and rich nation, we cannot violate nature's laws without suffering the consequences. If all the wealth and man-power of this great nation were brought to bear upon just one sapling it could not be forced to grow to a full-sized tree in less time than nature's laws require.

Notwithstanding the rapidly diminishing supply of timber, we are still wasting two-thirds of the tree from where it stands in the forest to the ultimate con-

VOL. I AUGUST, 1925 No. 2

Introducing Our Board

IN THE July issue of MODERN IRRIGATION, the first to come from the press, considerable space was devoted to the purposes and the organization behind the magazine. It was promised that in subsequent issues our concern in ourselves would be less evident. That promise, we believe, is carried out in the present number.

One article in this issue, however, merits especial consideration: the one which introduces the seven members of the Engineering Group on our Board of Editorial Advisors. This article, we feel, calls for no word of apology. We are proud, and rightfully so, of the calibre of the men who have consented to serve as counsellors to MODERN IRRIGATION. A reading of their records, as presented on pages 15 and 16, will explain just why.

In coming issues of the magazine the remaining groups of the board will be dealt with in similar fashion until all of them have been introduced. We feel certain that our readers will find this series of personal sketches of very genuine interest, not only because the subjects are connected with MODERN IRRIGATION, but because interest always attaches to the work and personalities of men who have done, and are doing, constructive things.

The Worth of Water

HOW much is water worth? This is a question that permits no more of a categorical answer than the famous query about the age of Ann, and yet it is one which demands an answer from every irrigator who is contemplating or carrying on the production of a given crop under conditions where irrigation water enters as a major item of cost. Today, the annual cost of water is, in many cases, the determining factor that decides whether or not the farming enterprise is feasible for the production of any but the most high-priced crops.

An article in this issue presents the results of a painstaking investigation into the costs of water to the irrigator in California, under varying sorts of enterprises. Every irrigation executive knows his own costs, the factors which enter into them, and where they should be lower, if there is a possibility of reduction. But not all have the opportunity to compare their own circumstances with those of other enterprises.

The figures of the Department of Agriculture, given in the article on the cost of water to California irrigators, may be a revelation to some readers as to where their properties stand with relation to the average of similar enterprises in representative parts of the irrigation country. To some, these figures will give reason for self-congratulation. To others, perhaps, they will serve as an inspiration to new economies.

Is It Worth While?

FOREST-FIRE season is upon us. As we go to press the newspapers tell of destructive blazes in many parts of the country. The head-lines tell of these great fires while they are at their height, chronicle the number of acres burned over and the casualties involved; but as the conflagration subsides, public interest in the subject is extinguished before the fire itself.

It is well that the people should be told about the lives lost in these fires, and the damage done to property, because it brings home to them, to some extent, the need for corrective measures. But it would be still better if they could be told, day after day, in every season of the year, that their own livelihood (to a large extent) and certainly that of their posterity, depends upon building up what the fire demon has mowed down, and in staying his ravages by forest protection.

In this issue of MODERN IRRIGATION, Francis Cuttle, one of the best known conservationists of the west, tells something of what conservation means to the irrigator and to the nation at large. It may, perhaps, be said that of all audiences in the world, an irrigation audience is the one least in need of such appeals as this. But irrigation is, also, most concerned in this problem, and until every one of us is alive to the pressing need of action, we can hardly expect relief from those whose interest is less direct and visible.

POINT *Of* VIEW

Possibly it is true that irrigators realize the importance of conservation more than other classes of people; but, if so, it then becomes their duty to spread that gospel abroad.

In the future we expect to deal repeatedly with this great subject, for it is one of paramount importance, and the more thoroughly saturated with its facts the irrigationist becomes, the more chance he has of making his influence felt in the direction of wise measures for conservation, reforestation and afforestation.

What's on Your Mind?

IT TAKES time for any new institution to establish itself in the minds of the people with whom it must deal. It will be months, at least, before MODERN IRRIGATION comes to stand for a definite, clearly defined concept in the minds of the workers in irrigation.

There is a popular jest about the hypothetical Englishman who, in his daily routine, encountered some trifling circumstance not to his liking in the usually well-ordered affairs of London life, and, as the immediate and logical measure of correction, sat down and wrote a ten-page letter about it to the London Times. But behind such a jest there must be a germ of truth and sincerity, which speaks very well indeed for the newspaper that, to the troubled Britisher, is looked upon as both friend and confidant.

It is something of this very kind that MODERN IRRIGATION aspires to become, frankly, in relation to the man engaged in any branch of the irrigation industry and its allied fields. Its purpose is to deal with, and to afford an open forum for the discussion of, the real and tangible problems that confront men who do things with water. In order that it may realize this ideal, it must have candid expressions from these men themselves. Is there something on your mind that we might helpfully discuss—or throw open to discussion by others in the industry? If so, give us the benefit of your ideas or your suggestions.

A Useful Department

TWO departments of the national government are officially concerned in irrigation, and are, through their activities, instrumental to a large degree in promoting advances in irrigation practice. The one which comes first, probably, to the mind of the reader, is the Department of the Interior. Its participation in irrigation is direct and practical, through its Bureau of Reclamation, and by virtue of the work of this Bureau, the Government of the United States is probably the largest single irrigator in the world. This department is active in irrigation also through its Indian Irrigation Service.

There is another department, however, which has direct contact with irrigation in a rather different way. That is the Department of Agriculture. Many of those who are constantly in contact with this branch of the government do not clearly understand the organization through which the department exercises its functions in the irrigation field. The form of organization is, indeed, rather involved and its nomenclature obscure.

The following outline will help to explain the relationship of irrigation activities to the Department as a whole:

1. Department of Agriculture.
   a. Bureau of Public Roads.
      1. Division of Agricultural Engineering.
         a. Drainage Investigation.
         b. Irrigation Investigations.
         c. Rural Engineering Investigations.

The irrigation investigations of the government are thus carried on as one subdivision of the activities of the Division of Agricultural Engineering, which is, in turn, a division of the Bureau of Public Roads, of the Department of Agriculture.

S. H. McCrory is Chief of the Division. Samuel Fortier, until his retirement from active service early in 1925, was Associate Chief, but he is now connected with the Division, in accordance with the rules for retirement, merely in a consulting capacity. W. W. McLaughlin succeeded Dr. Fortier in charge of the western office of the Division, at Berkeley, and holds the office of Acting Associate Chief.

These men are performing a real service for irrigated agriculture. While the activities of the Division are divided into investigations of drainage, irrigation, and rural engineering, the Berkeley office, which is the headquarters for the work in all the western states, is primarily concerned with irrigation. Much of the most valuable work of the Division is done through co-operation with local organizations—the state engineering departments, state universities and agricultural colleges, and state experiment stations.

A Tribute to Irrigation

COMMENTING on the recent meeting, in Salt Lake City, of the American Society of Civil Engineers, the Salt Lake *Deseret News* pays the following tribute to irrigators and irrigation:

"The outstanding subject of this gathering was irrigation, and it was pointed out that irrigation has released mankind from the bonds that once held him to the humid belt. It has made possible his reaching out and developing areas which were formerly thought to be not fit for man. Irrigation has benefitted not only those acres lying under the ditch, but the tracts above the ditch as well, for were there not developed farms, homes and communities, on the irrigated areas, there would be no industries and helpful pursuits along the uplands. It is a noteworthy fact that the products of irrigation constitute new wealth, which is widely distributed. Without irrigation it would have been impossible to settle and develop this great arid and semi-arid West."

Reclamation Chiefs, Touring in Northwest, Are Accorded Diverse Editorial Welcome

Secretary Work and Commissioner Mead, on Busy Trip, Arouse Varied Reactions of Gratitude and Resentment

ONE newspaper hails Hubert Work, Secretary of the Interior, on the occasion of his official visit to the northwest, as one who "speaks with understanding, on the unanimous advice of an able fact-finding commission," and asserts that the purpose which he outlines "will have the earnest support of an overwhelming majority of the people of the west."

Another editor calls the Secretary "the arrogant Dr. Work," and describes his visit as "spreading a pall of disappointment over Eastern Oregon," by his "negative attitude toward reclamation;" while from Boise, Idaho, comes the report that the Secretary's orders that water shall be turned off land of settlers in arrears in their obligations to the government have made him the storm center of a most contentious dispute.

THESE diverse reactions indicate at least one tangible result from the tour of the reclamation party through the northwestern states—a revived interest in irrigation and reclamation matters on the part of the press. The progress of the Secretary and Elwood Mead, Commissioner of Reclamation, with other members of the government party, through Wyoming, Montana, Washington, Oregon, and Idaho, has been marked by a continuous broadside of editorial comment, favorable and unfavorable, depending largely upon the attitude which the officials have taken toward local reclamation enterprises.

The northwestern trip of the Interior Department chiefs has been an intensely busy one. During the concluding days of June they visited projects in Wyoming and Montana, including the Milk River, Casper-Alcova, Sun River and other projects. At several points en route Secretary Work was called upon for speeches, and voiced in no uncertain terms his official attitude toward the problems of reclamation.

On June 26 the Secretary, after a visit to the Sun River project, spoke to a group of farmers at Great Falls, Montana, and declared that the successful future of western reclamation demands that "we should first *reclaim reclamation,* restore confidence in its government representatives, establish enthusiasm and discredit those who live by farming the farmers."

These thoughts have been the outstanding message of his speeches throughout the trip. At a banquet in honor of the official visitors, held at Spokane on June 30, both the Secretary and Dr. Mead gave expression to their attitude toward reclamation in addresses which received wide attention in northwestern newspapers.

"Reclamation has failed utterly, up to now," declared Secretary Work, while at the same time he affirmed his faith in its future possibilities. "We propose to begin to build up reclamation from the farm end rather than the dam end. The future of reclamation is brighter than ever in its history because we have taken time to discover the causes of its failure."

At Yakima, Washington, on July 2, Secretary Work spent an active day, officiating at dedicatory ceremonies for the huge Tieton dam, and turning the lever that released water for the irrigation of 10,000 acres of Washington land, and in the evening delivering an address in which he scored dishonesty on the part of settlers on reclamation projects in avoiding their obligations to the government.

AT SEATTLE, the visitors were in conference with Governor Hartley of Washington on the future development of the Kittitas project, which has been prominently in controversy between various factions in the state. Commissioner Mead made the positive statement that, regardless of the outcome of the interview with the governor, the government would go ahead with the $9,000,000 Kittitas development. In case Governor Hartley remains inflexible in his unwillingness to grant state aid to the project, several other ways are open by which the obstacles now in the way of completing the work may be removed, was the substance of his assertion.

From Seattle the party went to Portland, conferred with Governor Pierce of Oregon, visited the Vale, Baker, Owyhee, and Greely projects, and had conferences with the representatives of still other reclamation districts.

It was the "negative attitude" of the Work party toward some of these developments, notably the Baker and Vale projects, that "spread a pall of disappointment over eastern Oregon," according to the Portland *Journal,* whose correspondent notes the departure of the visitors for "a more contentious scene in Idaho," and hints: "That the apparently arbitrary and 'hard-boiled' attitude might reflect a negative policy on the part of the administration toward the expansion of western progress has been suggested."

SECRETARY Work's forthright statement that "reclamation has failed;" his desire to induce the governors of the states to pledge their efforts to obtain state aid for the projects as evidence of a desire to co-operate in the new reclamation policy; and his denunciation of settlers who, able to support fine cars and splendid homes, are still delinquent in their debts to the government, have naturally elicited various editorial comments. In sections where the reclamation officials have pledged their faith and support to contemplated projects, as in the Columbia Basin area, these comments are much more cordial than in those places where the "negative attitude" has been in evidence, such as the Baker and Vale projects, in eastern Oregon.

The Lewistown, (Montana) *Democrat-News* believes that "it is unlikely that the plan of Secretary Work to solicit financial aid from the states will be met with favor in Montana, not because our people would not most willingly grant such assistance, but because the state is financially unable to do so at this time."

Another Montana editor, however—of the Kalispell *Interlake*—believes that the new policy outlined by the Secretary marks a "long step forward" as it "recognizes the faults in the present system."

Commenting on the determination of Secretary Work and Commissioner Mead to enforce payment of debts from those able to pay, the Spokane *Spokesman-Review* is entirely in accord with their policy. It scores the evasion of debts in an editorial headed "West Will Not Stand for Repudiation," and says: "Secretary of the Interior Work and Commissioner Mead have started out resolutely to convince them of the error of their view. In this just and proper course they will have the support of an overwhelming majority of the people of the west."

(*Continued on Page 35*)

THE IRRIGATION DIGEST

A Monthly Bulletin Board of Brief Facts and Events from Far and Near

GRANTS PASS, OREGON.—One hundred interested business men of Grants Pass and farmers of the vicinity joined recently in a tour of the Grants Pass irrigation district to view the achievements which irrigation has made possible in this section.

MARYSVILLE, CALIF.—The Excelsior Water & Power Company is planning a million-dollar power and irrigation project on Deer Creek, on the South Fork of the Yuba River, it has been announced by Ray Manwell, secretary of the recently organized Yuba Water Users Protective Association.

MARYSVILLE, CALIF.—Proceedings have been initiated looking to the formation of the Dry Creek Irrigation District, embracing 9,435 acres of land in the Dry Creek section, between Marysville and Wheatland. The plan of the proposed district is to impound the waters of Dry Creek and tributaries.

THE DALLES, ORE.—Land owners in northern Wasco County have initiated proceedings for the formation of an irrigation district for the purpose of placing water on lands extending from the Dufur neighborhood to Mt. Hood Flat and Mill Creek. The irrigation of thirty thousand acres is contemplated.

BEND, OREGON — A survey of the Deschutes Irrigation Project under the direction of the Reclamation Bureau has been assured by the success of the Deschutes Project Association in raising $5,000 to match an available federal appropriation of the same amount for the purpose.

DALLAS, TEXAS—Engineers in charge of construction of the new water reservoir for the city of Dallas, being constructed at Garza, on the Elm Fork of the Trinity River, have announced that the $5,000,000 project will be completed on schedule time. The seventy-billion gallon body of water to be formed will be known as Lake Dallas.

SALT LAKE CITY, UTAH—The Utah Water Storage Commission has determined by official action that the Echo Canyon Reservoir and the Kamas flat canal will comprise the first units of the Great Salt Lake Basin Project. The Echo Reservoir will cost $3,000,000 to build. Water rights will be sold on a basis of 74,000 acre-feet at $40.55 per acre-foot.

SANTA FE, N. M.—A storage reservoir to cost $350,000 is to be built on the Bluewater Project, Valencia County, New Mexico. The dam will be ninety feet high and will impound water to form a lake seven miles long, and to put 10,000 acres of land under irrigation. Ten miles of main canal and from 15 to 20 miles of laterals will be constructed on the project.

MANILA, P. I.—Eighteen million pesos will be the amount of the expenditure of the government in the Philippine Islands for irrigation when projects now under construction have been completed. The current projects will be completed sometime in 1926. The irrigation systems developed by the expenditure of this amount of money have added about 100,000 hectares to the arable lands of the islands.

LOS ANGELES, CALIF. — A plan to expend $50,000 on an irrigation system for Griffith Park, a natural park in the outskirts of Los Angeles, has been approved by the water department of the city. The plan embraces the planting of green fire-breaks in place of the present bare fire-breaks in the park, and the irrigation of these by means of wells sunk in the dry bed of the Los Angeles River.

SAN DIEGO, CALIF.—The California State railroad commission has issued an order authorizing the sale of the Cuyamaca water property to the La Mesa, Lemon Grove and Spring Valley irrigation district. Under the terms of the sale the irrigation district pays $1,000,000 in bonds, the district voting some time ago an issue of $2,500,000 with which to take over the Cuyamaca system and to make improvements.

SAN FRANCISCO, CALIF.—Up to July 20 a total of 708 fires have been reported in the National Forests of the California district for the year, corresponding with 830 fires at the same date in 1924. The decrease is largely due to a reduction in the number of man-caused fires, of which in 1924 there were 556, and only 176 reported to date in 1925. District Forester Paul G. Redington, commenting on this record, pointed out the need for continued watchfulness during the remaining months of the summer, saying: "The worst of the season is still before us."

SANTA ROSA, CALIF.— Plans for a large irrigation project in Napa, Lake and Solano Counties, involving the irrigation of 60,000 acres of land from Putah Creek, have been revealed in an application filed with the state division of water rights.

The application seeks a permit to appropriate 400 cubic feet per second and 300,000 acre feet a year from Putah Creek, to be diverted in section 26, township 8 north, range 2 west and stored in section 26, township 8 north, range 2 west, and section 13, township 11 north, range 6 west. C. A. Tusch, 2211 Union Street, Berkeley, is the applicant.

COLTON, CALIF.—Under the supervision of City Engineer Charles A. Hutchinson of Colton, the Lytle Creek Conservation Association is commencng work, preliminary to the construction of a long, low retarding dam to provide a more efficient system of water distribution by maintaining a greater head. Flood control enters into the plan incidentally, but the main endeavor will be to create a greater head of water permanently to the end that the expense of pumping will be greatly reduced. Engineer Hutchison was selected as Supervising Engineer for the initial work, by the committee representing the constituted authority on the water interests concerned.

Engineers' Conclave Is Devoted Largely to Irrigation

American Society, in Summer Meeting, Discusses Problems of Water and Water Power

Meeting at Salt Lake City, Utah, on July 8, 9, and 10, the American Society of Civil Engineers devoted their attention to irrigation, reclamation and hydro-electric power as the dominant themes of their annual Summer Meeting.

The most eminent engineers of the nation were gathered at the conference, and many of the west's outstanding authorities had prominent places on the program.

Among the well-known men of the western irrigation industry who presented papers and participated in the discussions at the opening session were: Samuel Fortier, senior irrigation engineer of the Division of Agricultural Engineering, Department of Agriculture; Arthur P. Davis, a past president of the Society, now Chief Engineer and General Manager of the East Bay Municipal Utility District, Oakland; C. E. Grunsky, also a past-president, senior member of C. E. Grunsky Co., San Francisco; F. A. Banks, U. S. Reclamation Service, American Falls, Idaho; R. E. Shepherd, president of the Western States Reclamation Association, Jerome, Idaho; John E. Field, consulting engineer, Denver; and Louis C. Hill, consulting engineer, Los Angeles.

At later general and divisional sessions of the meeting, devoted to various phases of irrigation development, the following were speakers:

William Kelly, Director of Engineering, National Electric Light Association; Barry Dibble, consulting engineer, Redlands, Calif.; Markham Cheever, General Superintendent and General Manager, Utah Power & Light Company, Salt Lake City; Frederick H. Tibbitts, consulting engineer, San Francisco; M. C. Hinderlider, State Engineer, Denver, Colorado; Elwood Mead, Commissioner of Reclamation.

B. A. Etcheverry, Professor of Irrigation Engineering, University of California; Thomas H. Means, consulting engineer, San Francisco; Warren G. Swendsen, State Engineer, Boise, Idaho; Charles H. West, Assistant Professor of Rural Institutions, University of California; E. Court Eaton, Irrigation Engineer, Sacramento; Frank Adams, professor of Irrigation Investigations and Practice, University of California; Richard R. Lyman, Civil and Consulting Engineer, Salt Lake City; and J. B. Lippincott, consulting hydraulic engineer, Los Angeles.

S. T. Harding, Associate Professor of Irrigation, University of California; Elmer A. Porter, Chief Engineer, Sevier River Land & Water Company, Salt Lake City; O. W. Israelson, Professor of Irrigation and Drainage, Logan, Utah; Charles H. Lee, consulting engineer, San Francisco; Fred C. Scobey, U. S. Department of Agriculture, Berkeley, Calif.; G. E. P. Smith, Professor of Irrigation Engineering, University of Arizona; J. C. Stevens, consulting hydraulic engineer, Portland, Oregon; Marvin Chase, consulting engineer, Olympia, Washington; Fred H. Henshaw, district engineer, U. S. Geological Survey, Portland, Oregon.

Montana Irrigation Body Plans Constructive Work

Committee on Education and Colonization Opens Way for Consideration of Important Problems.

The recent appointment, by C. E. Atwood, President of the Montana Irrigation and Drainage Institute, of a Committee on Education and Colonization, is enterpreted by some observers to signalize the beginning of a new era of usefulness of that body in the field of land settlement, with which it has not hitherto actively concerned itself.

The chairman of the Committee, as announced by President Atwood, is L. A. Campbell, Director of Labor and Publicity of the Montana State Department of Agriculture, who is in charge of the department's colonization program. Associated with him are: Dean F. B. Linfield of Spokane, Washington; W. M. Wayman of Shelby, and R. W. Speir of Valier.

Dean Linfield is director of the experiment station of the State college at Bozeman; Mr. Benson is Agricultural Agent of the Northern Pacific Railway; Mr. Wayman is a pioneer in the development of irrigation in Montana, and Mr. Speir is Engineer on the Valier Irrigation Project in Pondera County.

The first task of the committee will be to formulate a statement of the problems and limitations of Montana settlers and the officials upon whom they rely and to work out a plan to make their work more effective and to lend encouragement to officials and to the settlers.

Approve Drainage Program

The Board of Governors of the Salt River Valley Water Users' Association has approved a program to drain the various water-logged spots on the Salt River project not taken care of under the present drainage system.

Equipment Men in Session at San Francisco

Association Discusses Varied Problems of Industry; Next Meeting September Eleventh at Sacramento

Financing the installation of pumping outfits, the standardization of electrical equipment, the second-hand, or used pump problem, standard contract and specifications suggestions and a host of other items, all of major importance to the irrigation equipment industry, were discussed and acted upon at the July 10 meeting of the Western Irrigation Equipment Association, held in San Francisco.

An executive session during the morning, devoted to routine problems of the association, was attended by C. F. Zimansky, Joseph H. Cox, C. A. Utley, Joseph L. Lawrence, J. J. Merritt, J. E. Lundy, V. E. Nittinger, and P. L. Nourse.

At the afternoon business session the principal speaker was Newton C. Owen, of the Contract Department of the Anglo-California Bank, who explained the credit system evolved by his organization for the assistance of manufacturers and dealers of farm equipment in selling their products on terms comparable to those used in selling automobiles, pianos and other so-called luxuries. The bank is carrying paper at eight per cent on the installation of pumping plants for individual irrigators. Under this plan, the purchase is allowed to make a down-payment of one-third, and to distribute the balance over twelve monthly payments, or, in the case of farmers who depend on an annual crop, to hold an unpaid balance over until the crop comes in. The latter arrangement, of course, involves a slightly higher carrying charge.

The subject of second-hand pumps is always good for a rousing discussion, and its introduction at the July meeting proved no exception. E. M. Breed, of San Francisco, is chairman of a committee appointed to deal with this troublesome problem, and this body is working on a plan by which some central agency may be created to take over the responsibility of distributing used equipment returned from a given territory because of the lowering of the water table to a point below the level of the pump's operation. Such an agency could place equipment of this kind in territory where water conditions would allow successful operation.

The standardization of power plant regulations for the installation of electrical equipment is another matter demanding immediate attention. V. E. Nittinger of San Francisco, assisted by a committee of his own choosing, is arranging

(*Continued on Page 28*)

Holds Water Not Taxable as "Improvements"

New Mexico Attorney General's office Renders Opinion in Response to Official Query

An opinion handed down by James N. Bujac, Assistant Attorney General of New Mexico, in response to an inquiry from the State Tax Commission, declares that irrigation water placed on the land may not be taxed as "improvements."

"However," declares the opinion, "the placing of water on the land would, of course, increase the value of the land and, it naturally follows, that the value of the equity of a purchaser of said land would accordingly be increased and this equity could be assessed and taxed at its increased valuation."

The legal point was raised when the county commissioners of Eddy County attempted to increase the assessed valuation of property within the county in order to provide a full-term school session. The letter addressed to the Attorney-General's office by the Tax Commission follows:

"I am inclosing letter from the tax assessor of Eddy county in connection with the assessment of lands which have been procured by purchase from the state. These lands are being assessed upon equity based as provided by the 1921 laws.

"It would seem that a great many of these lands are irrigated and are producing crops equal to the lands owned in fee simple and which are assessed at about $60.00 per acre. The state purchase lands, of course, bear only a very small percentage of the tax burden of the county.

"The county commissioners and assessor are attempting to raise the valuation of that county for the purpose of providing a full term of school and in this connection they desire to find some plan whereby the state purchase lands can be assessed for more than the equity of the purchaser and therefore, they have concluded to assess the water as improvements.

"You are requested to advise the tax commission whether or not it is legal for the county assessor and board of county commissioners to assess the water placed on this land as improvement."

Water Levels Recover

According to a report from the California Division of Water Rights, ground water planes in the Kings River district are showing a marked recovery, insuring an ample supply for pumping during the remainder of the season.

Plan Big Bear Survey

The California Division of Water Rights has announced that a comprehensive field investigation of water conditions in the region of Big Bear Lake, San Bernardino County, will be undertaken immediately. The Division says that the Big Bear region has reached the point where it is the most highly developed summer domestic area in the state. Harold Conkling, hydraulic engineer, will be in charge of the investigation of the water situation.

Tieton Dam Unbound to Water 100,000 Acres of Land

Second Largest Earth-fill Dam in World Formerly Known as Rimrock, Opened with Ceremonies

With appropriate ceremonies conducted before a crowd of enthusiastic citizens from many parts of Washington, the great Tieton Dam, formerly known as the Rimrock Dam, was completed and dedicated during July.

Hubert Work, Secretary of the Interior, was chosen to pull the lever that released the waters through the valves of the dam. Mrs. Nellie Strawn Benedict, oldest living white person born in Yakima County, Washington, where the dam is located, was the sponsor of the structure.

The following are some interesting facts concerning the dam as told by newspaper correspondents:

Located on the Tieton River, 42 miles from Yakima, it is the second highest earth-fill dam in the world. It will impound 202,000 acre-feet of water, which, with normal run-off, will serve 100,000 acres of land. The lake formed by the dam will be nine miles long, with the average width of one mile.

The first survey for the dam was made in 1916, a road constructed and camp established in 1917. The war made necessary the cessation of building activities until 1921, when actual construction of the dam was commenced. It was completed in April, 1925.

Its height from bedrock to crest is 321 feet; from river bed to crest, 233 feet. Length across top, 905 feet. From the upstream to the downstream toe, its thickness is 1,110 feet. The fill contains 2,000,000 yards of earth and rock, while the core-wall and spillway required 40,000 cubic yards of concrete.

A drainage area of 187 square miles contributes water, which will submerge 2,500 acres. The total cost was $4,215,000.

Water Rights Division Reports 1924-25 Busy Year

California Department Acts on Record Number of Applications to Appropriate Water

During the fiscal year ending June 30, 1925, the California Division of Water Rights received 606 applications, and acted upon 623, thereby reducing the number of pending cases from 874 to 857.

The 391 permits issued contemplate the appropriation of 13,807 cubic feet per second by direct diversion and 2,805,885 acre feet per annum by means of storage for the irrigation of 529,533 acres and the development of 815,662 theoretical horsepower.

Among the more notable agricultural developments for which applications were approved were those of Hot Springs Valley Irrigation District in Big Sage Drainage Area, Modoc County, Reclamation Districts 999 and 2068 in Sacramento Valley, Nevada Irrigation District in Nevada County, Camp Far West Irrigation District in Placer County and Oakdale and South San Joaquin Irrigation Districts in Stanislaus and San Joaquin Counties.

Among the more notable hydro-electric developments for which applications were approved were those of Nevada-California Power Company on Rush Creek in Mono County; Pacific Gas and Electric Company, on various tributaries of the Feather River and Butte Creek in Butte County; Nevada Irrigation District on various tributaries of Yuba River in Nevada County, Oakdale and South San Joaquin Irrigation Districts on Stanislaus River in Calaveras and Tuolumne Counties; J. W. Preston on Mokelumne River in Amador County, and Southern California Edison Company on San Joaquin River and tributaries in Fresno and Madera Counties. The last named project is one of gigantic proportions and one which probably sets record figures that will not soon be exceeded. The applications approved in connection with this single project contemplate the development of 559,410 theoretical horsepower at a cost of $80,000,000. It is expected that most, if not all, of the work mentioned above will soon be started, if it is not already under way.

Perris Reservoir Completed

The new half-million gallon reservoir of the city of Perris, California, has been completed and put in service. The reservoir is of reinforced concrete construction, eighty feet in diameter and sixteen feet deep. Coon Brothers, of Riverside, were contractors.

IRRIGATION MANAGEMENT

NEW MEXICO IRRIGATORS STUDY DISTRIBUTION

WAYS and means of improving present methods for the distribution of water from irrigation canals and laterals in New Mexico were considered recently at a meeting of prominent irrigationists at Las Cruces.

Representatives of the Farm Bureau, the Elephant Butte Irrigation District, the Bureau of Reclamation, and other interested parties participated in the discussion, which was called at the suggestion of L. M. Lawson, manager of the Elephant Butte irrigation project.

Numerous difficulties have recently been attending the management of irrigation water in this section, because of the largely increased acreage being put under cultivation. Because so much land under this project is being planted to cotton, it becomes essential that the water distribution be systematized so that every acre should have its due allotment of water when needed, and at the same time avoid confusion in water deliveries and costly ditch breaks.

MANY farmers in this district have complained that they are greatly handicapped on account of fluctuating heads. This is due almost entirely to the prevalent hit and miss system of delivering water at any time, to any water user, anywhere along the lateral, and to turning the water back into the main ditches at night. While night irrigation is not the most pleasant job in the world, it is absolutely necessary if fluctuating heads are to be avoided. It is also more economical as to labor and time, to irrigate continuously until through, and, in the heat of summer, night irrigation is more beneficial to nearly all plants.

Turning night water back into the laterals is also causing expensive ditch breaks, to such an alarming extent that the meeting readily agreed that something must be done about it at once. It was pointed out that farms along the ditches where such breaks are likely to occur must be protected, and the pocket books of farmers not directly damaged, must be protected also from the payment of consequent heavy damage claims.

Another matter of serious concern to the project, is the breaking of irrigation water into drainage canals. Of course, water intended for irrigation should ditches. The latter were constructed at tremendous expense to carry off seepage water, and if used for any other purpose cannot perform their proper function, without the expenditure of thousands of dollars of farmers' money to keep them in working condition. It does little good to spend $10,000 cleaning out a drainage canal, when, before the dredge has completed its work at the lower end, the upper end has again been washed full of dirt by irrigation water breaking in.

These points were thoroughly discussed at the Las Cruces meeting.

AT THE recent meeting of water users in the Elephant Butte Irrigation District, New Mexico, the means finally decided upon for the correction of some of their most pressing difficulties included:

1. To attempt to correct the evil of fluctuating heads by asking all irrigators to use their water continuously until through, and avoid turning it back into the laterals at night.

2. To require that the ditch-rider be notified at least 36 hours before water is wanted; the farmer to advise him how many acres are to be irrigated; and to require that the ditch-rider be notified before the end of the run in time to arrange for the next in line.

3. Each farmer to be given opportunity to irrigate as often as conditions on his lateral will permit.

4. Full discussion of all these problems before the local farm bureau organizations, with ditch-riders in attendance and taking part in the discussion.

IT was finally decided that the most practicable way to begin to correct the complaint of fluctuating heads, and to insure every acre of cotton and other crops its proper amount of water at the proper time, is to ask every farmer to use the water continuously, day and night, until he is through with it for each irrigation; the ditch rider to be notified at least 36 hours before water is wanted, the farmer to advise him how many acres he will irrigate, and the ditch rider to be advised before the run is finished, in time for him to arrange for the use of this water by the next in line; each water user to have opportunity to irrigate as often as conditions on his lateral will permit. It is believed that these simple and easy measures will accomplish much towards relieving the situation facing the farmers at the rapidly approaching peak of irrigation. But it will be necessary that the farmers and ditch-riders cooperate to the fullest extent to put even these simple plans into effective operation. To that end they will be discussed at all coming Farm Bureau Local meetings. Ditchriders will be invited to these meetings in order that the fullest discussion and understanding of the problems involved may be had.

Mr. Lawson, manager of the project, stated that he was not willing to attempt to establish any new system of water delivery unless the farmers themselves felt the need of it and were willing to assist him in improving the present distributing methods.

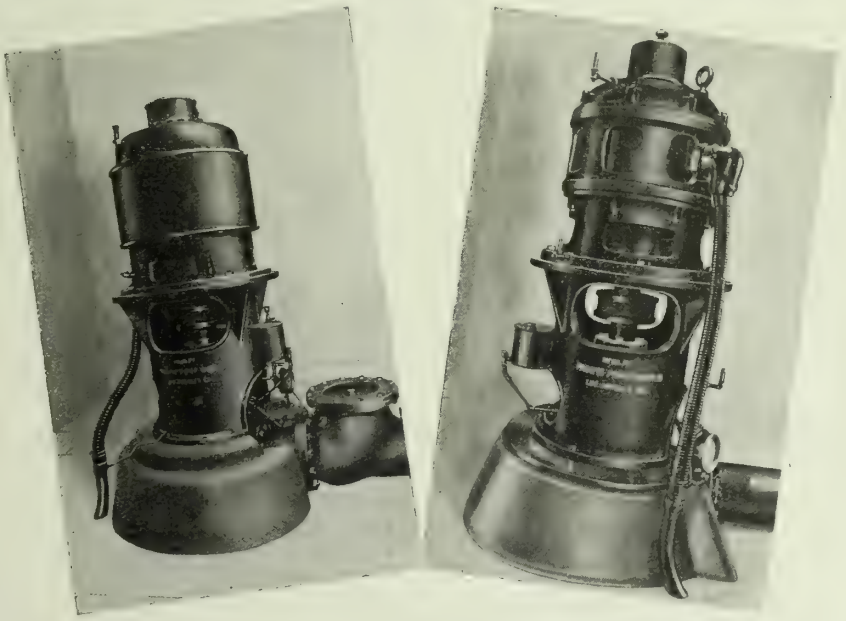
The question of filling drain ditches, it was pointed out, is one for the water users alone to decide. A continuation of the harmful conditions which have been prevalent means additional cleaning expense and ineffective drains and if the water users wish to keep operation and maintenance costs down as low as possible, they can aid in doing so by seeing that no irrigation water reaches the drainage canals.

Among those who attended the meeting beside Mr. Lawson, were F. J. Rigney, representing the Elephant Butte Irrigation District; J. F. Bennett and W. P. Thorpe, of the Farm Bureau; Paul A. Roach, local superintendent of irrigation; D. C. Caylor, project superintendent of irrigation; and V. G. Evans, chief clerk of the El Paso office.

Santa Monica Installs

Pacific Pumps

for dependable water supply



16-INCH PUMPS INSTALLED FOR THE CITY OF SANTA MONICA

DEPARTMENT OF PUBLIC WORKS
CITY OF SANTA MONICA
California.

Pacific Pump Works,
Los Angeles, California.

Gentlemen:

Replying to your inquiry regarding our experience with "PACIFIC" Pumps, we are pleased to advise that we are well satisfied. We now have three of your pumps, each having a capacity of two million gallons daily.

The pumps are well made, and we believe their operation has fully justified the selection.

Yours very truly,
John A. Morton,
COMMISSIONER OF PUBLIC WORKS.

STANDARD SPECIFICATIONS

Bronze Impellers in all Pumps—Heavy Column Pipe with "Butt-Joints" and lathe cut threads—Cumberland Shafting, always oversize, enclosed in housing with Bronze Bearings every six feet. Spider Guides every twelve feet—Gravity Feed Lubrication—Power Heads, all Full Floating — and Interchangeable belt or motor drive without changing head shafts.

Capacities 100 to 5000 Gallons per minute. Wells 8-inch and larger.

PACIFIC PUMP WORKS

350 Bicket Street Huntington Park, Los Angeles, Cal.

Modern Irrigation's Advisory Board

(*Continued from Page 16*)

"The State has problems in engineering, and, particularly, in connection with its irrigation systems, that require men with wide irrigation knowledge and training. It has one of these in Wilbur F. McClure, who holds the office of Chief of the Division of Engineering and Irrigation.

"Mr. McClure has filled this office to the distinct advantage of the State. He was an engineer of wide, diversified experience before he entered the service of the State of California, and his handling of difficult work in that service has served to enhance his standing in the engineering profession, where he is highly regarded by those familiar with his duties. He was born in Ohio, spent his youth in Pennsylvania and came to California in 1883,—after spending some three to four years in assisting in the location and construction of several hundred miles of railroad in Missouri, Kansas, Arkansas, Texas and New Mexico.

"In California his work has been that of general practice, railway and municipal engineering, until Governor Johnson selected him as possessing those qualities needed in his present position, to which he was appointed in January, 1912. He has held the office to the entire satisfaction of all administrations ever since."

Edward Hyatt, Jr., is Chief of the Division of Water Rights of the State of California, before which office all new developments involving the use of water must come, as well as a great many old ones. Mr. Hyatt is a native Californian, a graduate of Stanford University with the degree of civil engineer, and prior to his connection with the State service was engaged in hydraulic engineering along irrigation and power lines in various parts of the State. The office of which he is the head was formerly known as the State Water Commission, consisting of three members. By successive legislative enactments the Water Commission was re-created as the Division of Water Rights, State Department of Public Works, the Chief of the Division being the executive head. Mr. Hyatt has been with the State Water Commission and Division of Water Rights since 1916 in various capacities, and was appointed as head of the office in 1924. His long association with the complicated legal and physical problems surrounding all California water matters has fitted him for the position he holds to a high degree and under his direction the office has made an enviable record of service during the past few years.

R. V. Meikle began his technical work in 1906 as a draftsman in the water department of the city of Portland. For six years he served in various capacities on city water supply, power and irrigation projects in the northwest, graduating from draftsman to instrument man, and from instrument man to assistant engineer. One year was spent with the U. S. Department of Agriculture in California, and in 1914 he was named chief engineer of the Turlock Irrigation District, which position he still occupies. In addition he is chief engineer of the Don Pedro project for the Modesto and Turlock Irrigation Districts, and chief engineer for the Merced Irrigation District in the construction of the Exchequer Dam, now under way.

The Cost of Irrigation Water in California

(*Continued from Page 12*)

acreage under irrigation is small compared to the pump capacity, or the plant is only run a portion of the time it might be operated. The irrigator may find it easier to run a large pumping unit for a few hours rather than to irrigate the same acreage with a smaller plant operating perhaps several days. But the interest on the capital invested in the excessively large plant and the increased amount that must be charged to depreciation and other fixed charges form considerable items in the total annual cost of irrigation water. In such cases the fixed charges generally amount to more than fifty per cent of the total annual cost. Fixed charges such as interest, taxes, insurance and depreciation go on continuously, whether the plant is operated or not. Some irrigators fail to realize this, and measure the cost of pumped water by the amount of their oil or electric power bills. Many power schedules have a demand or minimum charge which is paid whether the plant is run few or many hours.

In cases where a larger pumping plant has been installed than is needed to supply the acreage irrigated, the situation may be remedied if more land can be brought under irrigation. In some instances farmers have increased the number of acres covered by supplying neighbors with water. However, care should be taken not to sell water for profit, as private plants entering such services may be declared public utilities. In some sections of the state mutual water companies or unincorporated associations have been formed to reduce the overhead expense of pumping. The value of the crop grown is the potent factor that determines how high an irrigator can afford to pump water.

Equipment Men Meet in San Francisco

(*Continued from Page 24*)

conferences with the various power companies, the State Accident Commission and the Railroad Commission to the end that some uniform plan may be worked out that all manufacturers can follow in constructing their control boards, and that all power companies will approve when installed.

The California State Committee on the Relation of Electricity to Agriculture has suggested standard contract and specifications forms for pump manufacturers to follow. Pump manufacturers have a number of individual contracts and specification forms of their own now in use, and an attempt is to be made through the association to find some common ground for this form that will be acceptable to both manufacturer and user and equally fair to all.

The next meeting of the association is scheduled for September 11, in Sacramento, during State Fair week. Milton Ferguson, State Librarian, will be toastmaster, and J. E. Hintoon, president of The Peoples Bank of Sacramento and president of the California Bankers' Association, will speak.

"Peerless" in New Factory

The rapid development of the irrigation supply industry in California is evidenced by the recent removal of the Peerless Pump Company from its former headquarters at 826 Santa Fe Avenue, Los Angeles, to a commodious and modern steel building at 1902 East 67th street. In the new quarters, where two acres of land provide for future expansion as needed, the company has a producing capacity capable of turning out 100 pumps per month. Seventy men are employed in the new factory, where a total floor space of 8400 square feet is devoted to the producing end of the company's activities.

The Peerless Pump Company has proved itself an organization that grows as fast as an irrigated crop, for it had its beginnings only a little over two years ago, with a personnel of about a dozen men. It has extended its operations and territory to embrace the entire state of California, and in line with an aggressive policy of expansion will soon establish offices in other parts of the irrigation country.

Officers of the company are: President, E. M. Smith, prominent California industrialist and financier; Vice-President and Chief Engineer, J. A. Wintroath; Secretary, J. R. Sauerwein, and Treasurer, W. P. Custer. J. R. Gilbert is sales manager.

What Conservation Means to You

(*Continued from Page 19*)

sumer. The late Secretary Wallace is quoted as saying that two-thirds of this waste could be saved by proper timbering methods. But that would involve some care and probably a slight diminution in the profits of someone between the owner of the tree and the ultimate user—and this loss of profit we seem unwilling to take in order to perpetuate our timber supply.

Fifty thousand fires annually destroy 10,000,000 acres; 150,000,000 acres of forested area in the south have practically no protection from fire at all, while it is stated on good authority that from three to four cents per acre per annum would give adequate protection to our forested areas and eliminate a large part of this tremendous loss.

Some people have the idea that reforestation is being carried on on quite an extensive scale in this country and that it will soon overtake the amount cut over and burned over so that a satisfactory balance may be had. The planting of redwood trees in northern California, by several of the large lumber companies, is a splendid demonstration of what can be done in the way of reforestation. Millions of redwood trees are being grown from the seed and these companies have a program of planting thousands of acres annually and hope eventually to have their planting equal their cutting. But when it is understood that the whole program of reforestation in the United States for the year 1924 was 36,000 acres that and we are cutting 10,000,000 acres annually, or reforesting less than fourtenths of one per cent of the area cut over, it will readily be seen how far we are from striking a satisfactory balance.

Of course, this does not mean that the 36,000 acres being reforested is the only young timber that is being grown, as there is a natural reproduction going on where timber is adequately protected from damage by fire.

BY WAY of comparison it may not be out of place to say that the little island empire of Japan had a reforestation program last year of 360,000 acres, ten times the amount being reforested in the United States. It will not do to say that labor is cheap in Japan and they can afford to have men do such work as this. Nature's laws do not take into consideration the cost of labor, but exact a penalty for every violation, whether it be by the individual or the nation at large.

Leaving out of the question the value of forests for recreational purposes, for the protection and perpetuation of game, for their influence on the health of the population, or their aesthetic value, let us consider for a moment the value of forests and brush for the conservation of water. Where watersheds are covered with trees or brush the precipitation, either in the form of rain or snow, is held in check and compelled to sink slowly into the ground to reappear in the small rivulets and streams which then flow perennially and regulate the flow of water in our small and eventually our great rivers. This means a uniform supply of clear water for domestic purposes and for irrigation, adequate water for navigation and a continuous supply of water for the development of hydraulic power which has recently become a necessity and enters into nearly every activity of life.

On the contrary, when timber and brush are destroyed on our watersheds the precipitation (in the form of rain or snow) when it melts, causes erosion, the filling up of small streams, high water, heavy damage from floods, amounting to hundreds of millions of dollars annually, lack of water supply for all of the purposes heretofore mentioned, distress, poverty and eventually depopulation. These statements may seem commonplace and something that everybody knows, but if they are, certainly knowledge on the part of everybody has not led to action that will prevent the destruction and loss of our timber and water supply with all of the consequent ills and distress which follow such loss.

THIS is a great economic problem, but it is too large a one to be solved by the individual or by any state. While it is an economic problem it is one that must be settled through political channels; that is, if it is ever to be solved satisfactorily, it must be by coordinated action by localities, cities, counties, states and, finally, the federal government, which should take the initiative.

How long are we, as a people, to proceed blindly and recknessly in the destruction of the remaining forested areas in the face of certain distress and disaster following such action? Do not dismiss this subject from your minds with the idea that it is the duty of the federal government or the state or county or city to take action. These are only the agencies through which the people of this country carry on their business. It is the business of every individual who has his own welfare, as well as the welfare of the country, at heart, to inform those in authority that action must be taken without delay to protect and perpetuate our timber and water supply.

The Tractor Is Useful On Irrigated Farms

(*Continued from Page 13*)

with engines which are not too heavily loaded than with engines which are loaded to their maximum capacity.

POOR oil should never be used in a tractor engine even when the outfit is being used for field work or other jobs which do not demand a large amount of power or continuous operation. It is, of course, even more important that only the best oil be used when the engines must be kept at work twenty-four hours per day week after week. It is also more important in continuous work to inspect the fan belt once or twice each day to make sure that it has the proper tension and does not show any indications of breaking. Most tractors, when used for pumping, run without an attendant practically all the time, hence the need for watching such details as this in order to avoid having the fan belt start slipping or break and cause overheating of the engine when no one is at hand to stop it in case of emergency.

There are on the market some devices designed to stop an engine in case of overheating from any cause, before the pistons have seized or other serious damage has occurred. If there is any place where such attachments would be valuable, it is on an internal combustion engine being run continuously and with only occasional attention from the operator, such as when used for irrigating purposes.

It should be borne in mind that tractor engines were designed for use at work where an operator is in practically constant attendance, seldom more than the length of the drive belt from the outfit. When these machines are utilized for 24-hour-a-day service with only occasional attention from the operator, therefore, some extra precautions must be taken to prevent the oil from running low, fan stopping, etc., which would be very minor matters if they occurred when the operator was present, but may cause expensive delays and unnecessary repair bills if they occur when no one is present to give them proper attention.

THE COVER

The cover on this month's issue of MODERN IRRIGATION is a photographic study of the Don Pedro Dam, built in 1922 by the Turlock and Modesto Irrigation Districts, California. The Don Pedro is one of the most modern pieces of engineering construction in the west. Its length is 1,020 feet; its height 283 feet, and its cost was $4,864,824.

HYDRAULIC ENGINEERING

Dealing with the Problems of the Irrigation Operating and Consulting Engineer

SOME ENGINEERING PROBLEMS OF WESTERN AGRICULTURE

By S. H. BECKETT

PROFESSOR BECKETT *is Associate Professor in Irrigation Investigations and Practice at the University of California, College of Agriculture. The accompanying article was presented by him before the recent convention of the American Society of Agricultural Engineers, and is published by special arrangement.*

AGRICULTURE under irrigation may be correctly referred to as one of the oldest industries. Scattered throughout the world, in Egypt, India, Southern Europe, China, Peru, Mexico and Southwestern United States, and dating back as far as 1700, B.C., are found the remains of an abandoned agriculture once highly developed and dependent upon irrigation. Whether the failure of these enterprises was due to engineering, economic or agricultural causes has not been satisfactorily explained. What ever the cause may have been, their existence is responsible for the statement that "it has yet to be proved that a permanent agriculture is possible under irrigation." Broadly speaking, the Irrigation problem of today is primarily agricultural; it is the problem of developing and maintaining permanent agriculture wherever irrigation is practiced.

However, no matter what the failures in the past may have been, or what may have been the cause, those of us interested in the engineering problems of irrigated agriculture look into the future with optimism. Failure of agriculture under conditions properly applied, as results of scientific investigations, has not been proven.

THE field of irrigation may be divided into three phases, irrigation engineering, irrigation economics, and irrigation practice. The irrigation engineering problems are those involved in the development and delivery of the water supply, based on safe engineering practice and at a cost which, under normal conditions of production, will assure the success of the project. The problems are strictly of an engineering nature, and although often demanding the highest engineering skill, are governed by established laws and practices, both in design and construction.

The problem of irrigation economics is one of determining, first, if the agricultural returns will justify the expenditure; and, second, of so financing the project that the water user will have at least an even chance to meet the obligations incurred by the development.

The agricultural phase, although generally assumed to be simple, chiefly because it is agricultural, is the phase of the development upon which the success of the project rests. Agriculture carries the financial burden of irrigation development. It is agriculture that must pay for construction costs as determined by the engineer, and under the conditions of payment determined by the economist.

Irrigation practice has been defined as "the artificial application of water to the land for the production of crops," and its problems are those which deal primarily with the development, transportation, and distribution of water on the farm, and its proper application to the crop.

IN THE development of private water supply, the prospective user either obtains water by gravity diversion from river or stream, or by pumping from open channels or wells. The design and construction of diversion works from open channels usually present no problems of a difficult nature. However, if the development involves the purchase of pumping machinery, the purchaser is immediately confronted with a series of perplexing problems of an engineering nature.

Conservative estimates place the number of irrigation pumping plants in operation in the United States at 25,000. California alone reporting the use of 21,000 individual plants in 1920.

The average irrigation plant is usually used in pumping from wells under lifts ranging from a few feet to a maximum of 350 feet; furthermore, these wells may be under conditions of seasonal fluctuating or gradually receding water table. Stored in the archives of pump manufacturing concerns, University, State and Federal offices are hundreds of tests of the efficiencies of these plants. Although in general these tests show low efficiencies, but little progress has been made in determining the causes of these low efficiencies or in finding a remedy for their improvement. The problem in pumping for irrigation is chiefly a problem of standardization—first, a standardization of methods and equipment for testing of wells, which will furnish information permitting the installation of proper equipment; and, second, if possible a standardization of the guarantee under which pumps are purchased.

In addition to this, more information is needed concerning the adaptation of various types of pumping machinery to varying conditions of lift, especially where definite information has been made available through a testing of the well. Finally, we should have available additional information concerning the economics of pumping. By this is meant; first, a careful analysis of conditions which warrant the purchase of pumping machinery; and, second, the economic capacity of the plant in view of the cost, the acreage to be irrigated, the period of operation of the plant and the cost of operation, especially under conditions of the "sliding scale" charge where electricity is used.

UNDER problems of water distribution on the farm may be included the following:

Design and construction of farm ditches.

Farm irrigation structures.

Measurements of irrigation water.

Seepage losses and ditch linings.

Design and construction of conduit systems of delivery, including the use of steel, wood stave, concrete and burned clay tile.

To the agricultural engineer the first three of the above present no problems of major importance. Improvement is always possible and such problems as more efficient machinery and better meth-

—A Satisfied Customer Writes a Better Advertisement Than We Can!

MODERN IRRIGATION

When we started the construction of the system we considered carefully the matter of measuring devices. There was no question as to the advantage of installing some kind of device, but the particular make and unit of measurement was a matter of choice. After much investigation we determined upon the Sparling meter as being the most practical field meter for our particular needs. We now have nearly 100 of these meters installed and operating. They have given very satisfactory service and are the basis and final court of appeal in all controversies regarding the amount of water delivered to users.

What Richard Bard, President of the Zone Mutual Water Company, Ventura County thinks of

SPARLING METERS

An excerpt from an article in the July issue of *Modern Irrigation:*

. . . . . "After much investigation, we determined upon the SPARLING METER as being the most practical field meter for our particular needs . . . . have nearly 100 of these meters installed and operating."

Our experience in solving problems having to do with Water Equipment is at your disposal.

ods of construction of farm ditches; standardization of design for farm irrigation structures and the adaptability of these designs to the various soil types in which the structures may be placed; simplification of methods of measuring water on the farm, especially under conditions of widely fluctuating heads, both in open channels and closed conduits, are all of sufficient importance to justify consideration.

The problems of seepage losses are not only important due to the economic loss through waste, but also are a constant menace to the water user. Ultimately water lost by seepage must be reclaimed by drainage. Measurement of these losses, although indicating the general extent of the loss, are of little use where they do not lead to preventive measures. Much valuable work has been done in a study of seepage losses and lining of large canals. This information should be made applicable to smaller ditches and laterals of the farm, especially in comparing their adaptability, cost and their efficiencies when compared to the underground delivery system.

IN THE design and construction of underground distribution systems on the farm, there is opened up to the agricultural engineer a practically untouched field for investigation and research. One western state alone reports an estimated installation of 1200 miles of concrete pipe per year. Although methods of manufacture are constantly being improved and recent years have shown very appreciable improvement in the quality of pipe manufactured, only limited investigations have been made to determine tensile strength, imperviousness and other qualities as developed under different methods of manufacture and curing.

The problems of pipe manufacture may be briefly listed as follows:

Investigations into methods of manufacture, including the selection, grading and mixing of materials.

Methods of curing new-made pipe.

Expansion and contraction of pipe, including effects of variation in soil and water temperatures, depth of laying, method of laying, use of expansion joints, etc.

Standardization of outlet structures including the design and installation of pressure stand, relief stands, delivery gates, division boxes, sand traps, etc.

Costs and adaptability of concrete pipe in comparison with the use of steel pipe, wood stave pipe, burned clay tile, or the lined open ditch.

Although these may be considered primarily as manufacturing problems, they are of importance to the water user, who, in the final analysis, is the one who profits if the installation is a success, and loses if the installation fails.

The problems in connection with the use of water on the land may be simply stated as follows:

1. Water requirements of irrigated crops, including the whole field of relation of plant growth to moisture supply.

2. Method of application, including the whole field of soil moisture movement.

3. Preparation of land for irrigation.

In other words this is a problem of, first, determining the economic water requirement of the crop to be irrigated including the proper time and frequency of irrigation; second, to determine the method of application which, under existing conditions, will permit the most uniform distribution of water through the soil mass; third, the proper preparation of land which will permit this uniform distribution.

Almost since the very beginning of modern irrigation practice, observations in the shape of so-called "duty of water investigations" have been made of existing uses and practices. Measurements, almost without number, have been made of quantities of water, both gross and net, which ditch companies and individuals have been using. The problem is not one of how much are they using, but how little should they use. If we hope to maintain a permanent agriculture on

Seventeen Rules to Remember

By G. E. P. SMITH

1. Keep the ditches in order. A sluggish current increases the water loss.

2. Line the ditches with concrete, or lay cement pipe lines. This settles the problem of seepage loss permanently and almost eliminates ditch maintenance.

3. Grade the land surface evenly. High places become "slick," low places invite watergrass, sun scald, and puddling of the soil. The "lands" should be level crosswise, but with adequate fall lengthwise.

4. Plow deeply. Deep-plowed soil utilizes all of the rainfall, takes the irrigation water more readily, forms a mulch quickly and permits better aeration.

5. Use short lands for light soils. The best length depends mainly upon the character of the soil, but also on the slope and on the head of water available.

6. Divide a large head of water into "unit heads" of such size as to give uniformity of irrigation throughout the length of furrow or land. If the upper ends of lands get too much water, divide the head into fewer lands or order a larger head; if the upper ends get too little, irrigate more lands at the same time. Larger unit heads are needed on lighter soils, flatter slopes, or longer lands or furrows.

7. Test the soil the day after irrigating to determine the depth of water penetration. Use a soil auger, a pointed rod, or a shovel. Ascertain if the water penetration is about right and whether it is uniform from end to end of lands or furrows.

8. Irrigate before planting. Have the soil well stored with water to a depth of 4 to 5 feet. Then allow a good root development before the next irrigation.

9. Do not overirrigate. An excess of water is an injury. Many crops do not require heavy irrigations. Even alfalfa can be given too much at a time.

10. Do not hesitate to irrigate at night. The big projects run water continuously. Why should not a pump irrigator also? The evaporation loss is much less at night. Pumping plants should be operated night and day through the hot growing months.

11. Irrigate at the most favorable time. Irrigate alfalfa when two-thirds grown, but not just after cutting; grains when just out of boot; and corn when in tassel and silk.

12. Examine the soil occasionally. Bore or dig into it at least 3 feet. Does it pack nicely in the hand? Irrigate when soil and crop indicate the need of water and not according to calendar. There should be always some reserve moisture in the soil to prevent wilting and to assure a profitable yield.

13. Cultivate. A loose soil mulch prevents baking and cracking of the soil and permits aeration of the roots. Cracks permit heavy losses by evaporation. Use an alfalfa renovator in August, in late fall, and in spring if alfalfa has been pastured. Row crops need cultivation after each irrigation, though in cases of cotton, corn, and milo cultivation is not possible in the latter part of the season.

14. Fight the weeds; eradicate them. Weeds rob the crop of water, sunshine, and plant food.

15. Rotate the crops; keep the soil fertile. Use alfalfa in the rotation; grow legumes and plow them under; all crop residues, straw, and stalks should be plowed under.

16. Do not irrigate the roads. Your neighbors do not appreciate this. Keep the gophers out of the ditch banks, shut off the water in time, and the highways will not become bogs.

17. Measure the water. Set a weir on your supply ditch. Are you getting as much water as you pay for? Do you know how much each crop is using? You measure everything else; why not the water supply?—*From Bulletin 101, Arizona Agricultural Experiment Station.*

our irrigated lands, water must be applied to meet the demands of the crop to be irrigated. The information needed can only be obtained by a fundamental study of the basic principles underlying the use of water by plants, determining first their theoretical requirements, and then as nearly as possible, meeting that requirement through improved methods of application.

IN CONSIDERING methods of application the problem is basically one of soil moisture movement. Theoretically a proper application of water demands that the effect of the mechanical composition of the soil on moisture movement be known. Observing water users have noted that the rate at which their soils absorb water is constantly changing. Why? What is the effect of existing moisture content on the rate of soil movement? To what extent does the volume weight and moisture equivalent of soil change under irrigation and is there an actual transportation of soil particles through the soil mass during irrigation? When we have answered these, we can more intelligently talk of irrigated methods, and more properly advise as to methods of preparation of land.

The above are but a few of the problems of present day irrigation practice. They are problems of agricultural engineering—that is, the science of engineering applied to agriculture. When we have solved some of them irrigation practice may be more simple.

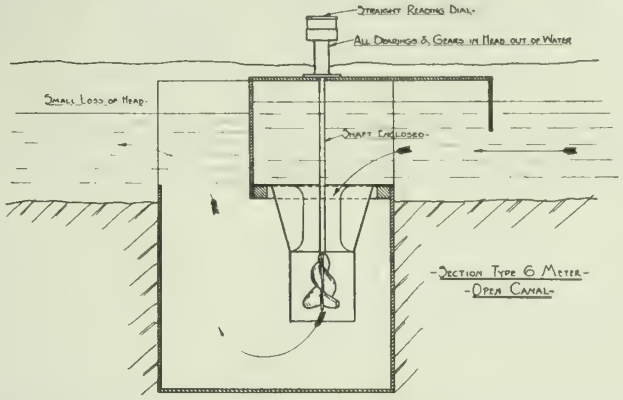
Sec'y Work Visits Northwest

(*Continued from Page 22*)

The Portland *Journal,* in correspondence from Ontario, Oregon, greets Secretary Work's departure from the state "with mingled feelings of regret and relief in which relief predominates," and states: "He was hailed in Portland as a leader in the development of the west through reclamation . . . he passed over the Snake River bridge into a turbulent Idaho situation of his own creation, identified as an antagonist whose declared resistance must be overcome."

Editorially, the same newspaper comments: "By antagonizing the West as he has done in his recent visit, Secretary Work can only hope to bring to a pause the reclamation of lands through the agency of the federal government. That may be his desire. If so it is poor policy and poor politics." The *Journal* concludes: "No mere man, even in temporary official position, can stand against that march of progress to which the nation itself is keeping step."

THE **RELIANCE** METER



Straight Reading Dial
All Bearings & Gears in Head out of Water
Small Loss of Head
Shaft Enclosed
Section Type G Meter
Open Canal

THE RELIANCE IRRIGATION METER has been the standard low pressure Meter for 10 years—thousands installed throughout the irrigated sections of the West. Built in various types and sizes to fit all deliveries on canal and pipe systems. Easy to install—easy to read. Straight reading cubic foot or acre foot dials. Simple in construction, few and slow moving parts—upkeep negligible. No bearings or gears under water—small loss of head. Unaffected by dirt and floating debris in water. There is a size and type to settle your measurement problem.

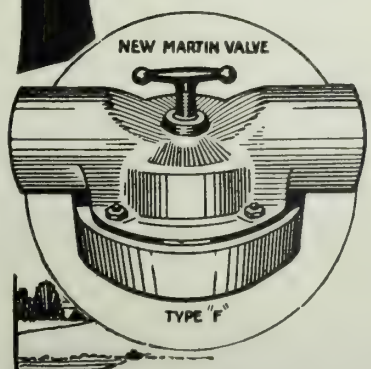
For full information and prices write—

RANDALL CONTROL & HYDROMETRIC CORP.
1014 E. Ninth St., Los Angeles, Calif.

New Method

FURROW CROP IRRIGATION

Furrow crops such as beans, lettuce, cotton, etc., may now be irrigated most advantageously by the New MARTIN method illustrated below. "A" represents the new Martin Valve, Type F, which is attached to the concrete standpipe "B." Water is controlled by this valve which discharges through two outlets made to fit into standard 4-inch galvanized surface pipe "C." Three or four joints of surface pipe are used on each end of the valve. These surface pipes are fitted with small galvanized iron gates "D," which control the flow of water into each furrow.



Equalization of the flow to every part of the field can be attained with this improved equipment. Uneven grades and soils of various texture can be irrigated in this way with great saving of time and water. No open-topped standpipes to overflow. Corners and waste spots can be reached. The sections are easily and quickly put in place or carried to the next section to be irrigated.

Write us for full particulars regarding MARTIN Irrigation Appliances. Our complete catalog is now ready.

WHO'S *WHO* AND WHO'S *WHERE*

IN IRRIGATION AND RECLAMATION

Personal Notes and Impersonal Observations About Men You Know

J. L. Savage, Designing Engineer of the Reclamation Service, was recently a visitor on the Salt River Valley project, Arizona. Mr. Savage expressed himself as much pleased with the engineering aspects of the entire project.

Offices of the Maricopa County Farm Bureau and the Arizona State Farm Bureau, in Phoenix, have been moved to Water Users' Building. County Agent Harry A. Stewart and Walter Strong, Secretary of the state federation, are to be found at the new headquarters.

Congressman Addison T. Smith, of Idaho, chairman of the house committee on irrigation and reclamation, while in Salt Lake during July expressed himself as confident of the future of reclamation, declaring that he believed settlers would be able to pay up their obligations fully if granted sufficient time.

Kirk Bryan, Geological Survey engineer, has begun an investigation of underground water resources for the State of New Mexico, pursuant to authorization made by the 1925 legislature. Mr. Bryan began reconnaisance of the field in July after a consultation with State Engineer George M. Neel at Santa Fe.

R. W. Sparling, of the Los Angeles firm of R. W. Sparling, has just returned from an extended trip through northern and central California. Mr. Sparling reports an excellent agricultural outlook throughout this region, wtih a continually growing demand for irrigation meters.

H. G. Miller has been appointed superintendent of the Imperial Irrigation District by the board of directors, replacing Paul S. Jones. Mr. Miller has been in the service of the district for more than ten years, and has advanced through the positions of zanjero, hydrographer, water master and assistant superintendent to his present post.

Max E. Cook, farmstead engineer of the California Redwood Association, formerly located in Los Angeles, has removed his headquarters to 24 California street, San Francisco, where he is organizing an Agricultural Department for the association. The department will make a farm building service available to lumber dealers, colonizers, farmers and other agricultural interests.

T. J. Dunnewald, director of soil surveys of the University of Wyoming, and W. G. Harper, soils expert of the Bureau of Reclamation, were recently in Saratoga, Wyoming, engaged in making a soil survey of the Saratoga irrigation project. If the Saratoga project is carried through as proposed it will open approximately 40,000 acres of new farm land in Saratoga and Encampment Valleys.

Charles C. Frisbie, the engineer who made the survey for the relocation of the "All-American canal" in the Imperial Valley, has been employed by the Imperial Irrigation District to survey the water usage of the upper Colorado River, with a view to protecting the rights of Imperial Valley water users. The Imperial district declares that excessive use of water on the upper part of the river is causing a serious shortage.

C. F. Zimansky, of the G. W. Price Pump and Engine Company, president of the Western Irrigation Equipment Association, has announced his intention of performing the impossible, and forgetting about pumps and irrigation for the period of about ten days. This noteworthy occasion is to be celebrated by a trip to the Yosemite Valley, a suitable reward for any man who is taking his first vacation in six years.

R. J. Coffey, district counsel for the United States Bureau of Reclamation, with headquarters at Berkeley, California, was in Klamath Falls, Oregon, during July, on business for the Bureau. He conferred with officials of the Klamath Irrigation District on the terms of a contract by which the district expects to take over its own operation and maintenance, now under the supervision of the Reclamation Service.

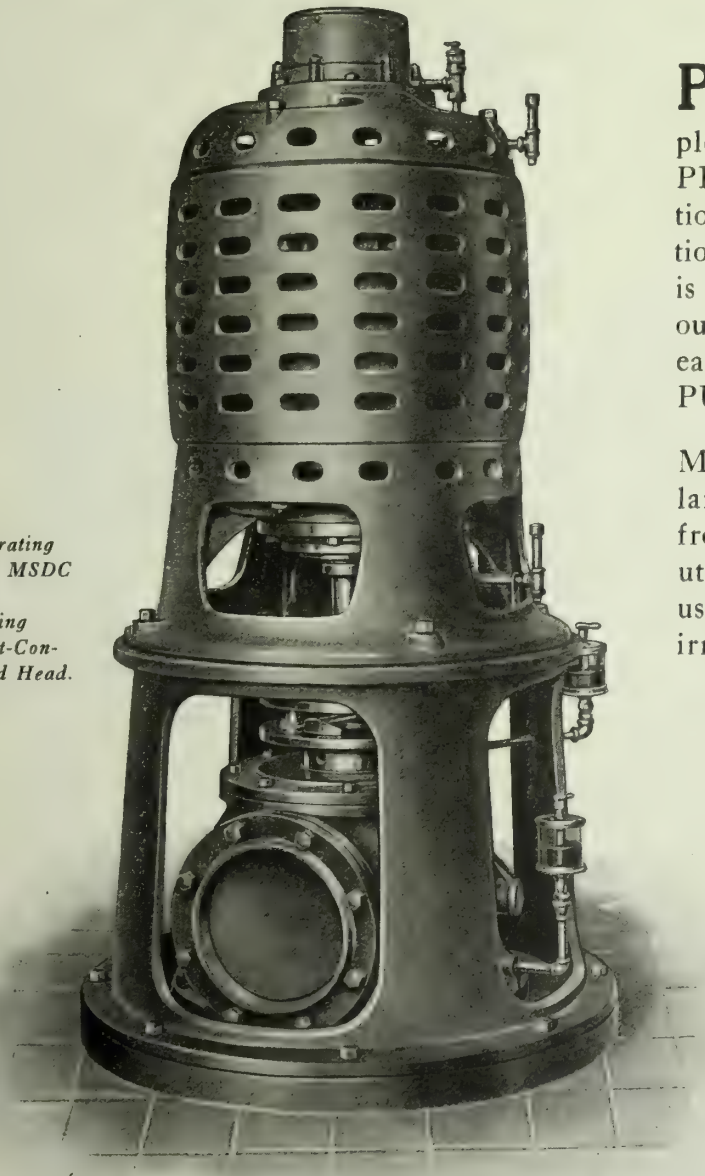
Arthur P. Davis, formerly director of the Reclamation Service, and now chief engineer of the East Bay Municipal Utility District, Oakland, California, has been asked by the Imperial Irrigation District to attend the conference of the Tri-state Colorado River Joint Commission, which meets at Phoenix in August, as their representative. Mr. Davis will represent other municipalities and organizations of Southern California at this session, as well.

George C. Kreutzer, director of reclamation economics, Department of the Interior, was one of a party of reclamationists which made a survey of the economic aspects of the Deschutes, Oregon, project, during July. Other members of the party were Herbert D. Newell, manager of the Klamath project, M. H. Lapham, soils expert, Department of Agriculture, Berkeley; Prof. Charles F. Shaw, University of Oregon; and Prof. W. L. Powers, Oregon Agricultural College.

Further indications of the reorganization policy undertaken by the Directors of the Imperial Irrigation District, in the interests of strict economy, have been evident during the latter part of July. The services of D. W. Murphy, well known Los Angeles consulting engineer, who was retained by the District as drainage engineer, and who has been successful in reclaiming lands of the district which had "gone alkali," were discontinued during the month in line with the general economy program. Still later the Directors voted to eliminate the office of chief engineer, held by Ray S. Carberry, and to request his resignation. The office of general manager was created to take the place of that of chief engineer, and, as reported by the press, Munson J. Dowd, formerly Head Watermaster, was named to this position.

PEERLESS

IN ALL THAT THE NAME IMPLIES



Illustrating Type MSDC Full-Floating Direct-Connected Head.

PEERLESS PUMPS have made new history in principles of Design, Construction and PERFORMANCE. The selection of materials and the execution of every detail of construction is handled with the utmost care—our sole ambition being to make each and every PEERLESS PUMP a masterpiece.

Made for wells of 7 inches and larger and with capacities ranging from 180 to 2700 gallons per minute, PEERLESS PUMPS are used wherever the conditions of irrigation are *most exacting.*

The PEERLESS organization of specialists offer an advisory service gratis to anyone who may be perplexed with difficult irrigation problems.

In New Offices Soon

We will soon be fully installed in our new factory and office building at 1902 East 67th Street, a most modern plant where PEERLESS pumps will be turned out with the greatest degree of perfection. You are invited to call and inspect our new quarters.

RECLAMATION

ECONOMIC PRINCIPLES SHOULD GOVERN RECLAMATION

By DAVID WEEKS

Division of Rural Institutions, University of California

RECLAMATION of arid, swamp, flood and cut-over lands has been a subject of many controversies in Congress, in state legislatures and in numerous other official and non-official bodies. At present there are three reclamation policies in existence, each of which represents the point of view of a fairly large class of the American people.

One of the policies may be stated briefly—*"Reclaim no more land"*; another—*"Reclaim land, create financial machinery and reclaim more land"*; while the third group insists that reclamation development should be governed solely by supply and demand.

Senator McNary of Oregon, Chairman of the Senate Committee on Irrigation and Reclamation, will introduce in the next session of Congress a bill "To encourage the development of the agricultural resources of the United States through Federal and State cooperation". Under this measure any district in any state would be able to secure temporary financial aid from the Federal government for reclamation, provided state laws contain provisions whereby bonds may be issued by the district as a first lien on all the lands within its boundaries. The feasibility of the project would be determined by the Secretary of the Interior, subject to review by Congress. The *Country Gentleman* has uttered a war cry against Senator McNary in a full page editorial in its issue of May 23 and is publishing a number of articles apparently aimed at his reclamation policy.

FEASIBILITY is the keynote of the proposed legislation and upon this word hinges the success or failure of the Senator's bill. *Feasibility* has within its five syllables all that engineering, agricultural and economic investigations can determine, and then some.

Feasibility is dependent upon physical factors such as soil, drainage, water supply and workmanship of constructon.

Feasibility depends upon climatic factors such as rainfall, length of growing season, and range of temperature.

Feasibility most of all depends upon economic factors, and upon economic principles rests the future not only of each individual project but the successful administration of the whole plan. The first cost of raw land is not as important as the cost of its agricultural development. Costs of construction, costs of preparing land for irrigation and cultivation, costs of building houses and barns, costs of buying livestock, costs of buying equipment and costs of planting and bringing crops into production form one important group of economic questions to which we have not given proper consideration in the past but which must be considered in the determination of feasibility.

MARKETING and transportation facilities, crop adaptation, costs of production and gross returns—not only cost of production and gross returns today but for the years to come—must be estimated in the determination of *feasibility*. Costs of production and gross returns over a long period of time are a complex study and are closely related to the operation of the law of supply and demand. If this were a simple law of nature, it could be examined by experimental processes. The whole study is, however, complicated by paucity of information, by human emotions, fickleness, changing desires and prejudices. One of its most disturbing features is its slowness of operation.

When prices are high, there is a *tendency* for a smaller quantity of a product to be consumed and for greater quantities to be produced. Periods of high prices are periods of agricultural expansion. When prices are low, the opposite *tends* to be the result. Tendencies, however, are often upset for a time by disturbing influences. A low price of dairy products will often result in many farmers adding to their herds in order to bring their income up to its former level. After a time one dairyman after another will change from dairying to some other type of farming or will discontinue farming entirely. On the other hand many farmers will hesitate for a time to build new dairy barns to take advantage of a rise in price. The response gradually takes place, however, and there is an increase in supply. This is only one type of instance illustrating the prevalence of influences which disturb the operation of the law of supply and demand. Numerous other instances could be given of this retarded response of supply to price change.

These irregularities are much more pronounced in regions where agricultural production is largely on reclaimed lands, as it is in the west. As a rule in reclaimed areas agriculture is more intensive. Crops are more permanent in character. A period of high prices which indicates an increased demand is followed in the first instance by an expansion of the area under irrigation. Many new projects are organized during this period, but the construction is spread over a period of four or five years. Perhaps by the time water is available prices have gone down, but the lands within the irrigation projects must be developed or be confiscated by the overhead charges brought about by the new construction.

AS A RESULT thousands of acres of trees, vines, and alfalfa are planted which, by the end of three or four years, come into full bearing. Alfalfa, of course, does not take so long, but it does take time for the new farmer under irrigation to purchase necessary equipment and livestock. Thus, about nine or ten years after development has been started by the demand impulse or maximum prices, only part of the lands have been brought under full production. Much of this development is carried on during years of depression in the face of negative public sentiment in regard to agricultural expansion. A large part of the lands, due to high costs of development in proportion to current prices, wait for another

VOTE BONDS TO COMPLETE GREAT TEXAS PROJECT

FORTY thousand acres of land in Texas, lying in Bexar, Medina and Atascosa counties, comprising Medina Irrigation District No. 1, will be supplied with water through the completion of the original Medina project, as the result of a unanimous vote by residents of the district, authorizing the issue of $2,500,000 in bonds for that purpose.

The Medina Irrigation District was formed fifteen years ago, Dr. F. S. Pearson, of New York, being the moving instrumentality in conceiving the plan and putting the first steps into execution. The Medina Dam, at Medina Lake, was completed in 1912, and shortly after this the further development of the district was delayed by the European War. Dr. Pearson had interested English capital in the completion of the project, and was on his way to England on the Lusitania when it was sunk by an enemy submarine. His death and the interruption occasioned by the war was a severe setback for the project. Subsequently the companies organized to carry on the work were thrown into a receivership, and work came to a standstill.

As the result, however, of the recent authorization of bond issues amounting to $2,500,000, the project will be carried out substantially as originally planned. Additional canals and laterals will be constructed without delay, which will bring water to all of the 40,000 acres in the tract, and the ambition of the first organizers of the district will be on the way to realization.

UNDER the new project, the 40,000 acres of fertile land in the district will be taken over by five trustees, who will operate the farm lands solely with a view to selling them.

The irrigation of the farms will be under the management of the Medina Valley directors. With the taking over of the farm lands and the irrigation project, the Medina Valley Irrigation Co. and the San Antonio Land & Irrigation Co. will go out of existence.

These companies have been in the hands of Hugh Robertson, federal receiver. Mr. Robertson about a year ago was appointed receiver for the companies interested in the development, and plans were begun to carry through the project.

The main dam at Medina Lake is 164 feet high. From it the water runs to a diversion dam, and from the diversion dam it is sent into flumes and canals which carry it to the fields of corn, cotton and truck. It is estimated that the land in the area will be worth $25,000,000 after the work has been completed. The irrigation district will be capable of supporting from 10,000 to 15,000 persons.

There are now only about 250 tenants in the area.

Although there are slightly more than 40,000 acres in the district now, engineers declare that the dam and its canals can be made to supply 60,000 acres.

The diversion dam, four miles below the main dam, is 500 feet long and 48 feet high. The main canal, carrying water from the diversion dam is 24 miles long.

PRACTICALLY every acre of the tract to be brought under irrigation is arable, and the water from Medina Lake will be distributed to the area by gravitation and entirely independent of pumps.

"There is not a single acre that can not be irrigated by gravity, the water flowing through canals from the lake in the hills to the acreage 25 to 30 miles removed, reaching every single acre by gravity," officials of the project declare.

The holdings of the companies which were in the receivers' hands were to be sold at foreclosure, the present bondholders buying in the properties and in turn selling them for the $2,500,000 in bonds.

Only about 8,500 acres are at present under irrigation, but additional canals and laterals necessary to care for the entire tract will be constructed. Crops on the area now under irrigation are flourishing.

The variety of the soil and topography in the tract makes the proposition a general one, with parts peculiarly adapted to truck, fruit and general farming.

At the recent election which approved the bond issue to complete the project, every vote cast was recorded in favor of the proposition. Of seventy-one eligible settlers who were privileged to cast votes, sixty-one appeared at the polls and voted in the affirmative.

The first work to be begun under the extended project is the completion of the plan for extending the main irrigation canal and building the laterals which will make water available for the entire area of the project. This will require an expenditure of approximately $720,000 and is now going forward.

The refunding and enlarging plans of the project have been worked out with the approval of the financial interests holding the outstanding securities of the district, and the officials of these companies have expressed satisfaction at the prospect of carrying the project to a successful culmination. The new land irrigated by the enlarged project will be distributed to actual settlers, in tracts averaging about forty acres each.

Reclamation and Economics

(*Continued from Page 38*)

cycle of high prices to be brought under cultivation. This retarded development has resulted in the financial distress of thousands of farmers and failure of many irrigation enterprises.

BECAUSE of these complex irregularities a plan might be suggested which is a modification of the attitude toward letting development drift along in a rather haphazard fashion in response to supply and demand. Such a plan would contemplate a careful study of the operations of this and other economic laws with a view to meeting crises before they occur.

In California we are endeavoring, by the investigation of actual rural conditions, to develop a practical method of economic analysis of agriculture and agricultural lands under irrigation. There is much yet that we do not know; but one by one we are eliminating the uncertain factors upon which *feasibility* depends. As the work continues in this and other states, divergent ideas like those of Senator McNary and the editor of the *Country Gentleman* will be reconciled. In the light of more economic knowledge, these two policies could be merged and coordinated with a modification of the one placing sole dependence upon supply and demand. This should bring about a sane reclamation policy which is economically sound.

The training of professional men equipped with an understanding of these difficult problems, the education of the public, especially those directly concerned in agriculture and reclamation development, concerning the purpose and need of special knowledge of this kind, will do much to prevent unwise and ill-timed development and yet permit of a wholesome expansion of our agricultural resources.

Water Power Figures

The developed water power of the world in 1920 was about 23,000,000 horsepower, according to an estimate made by the United States Department of the Interior in 1921, through the Geological Survey. At the end of 1923, according to the best information available, it was about 29,000,000 horsepower, an increase of 26 per cent in about three years.

Pump Irrigation for Desert Lands

(*Continued from Page 14*)

THE MOJAVE Desert is within a radius of 50 to 150 miles of a population of 2,000,000 people in San Bernardino, Orange, and Los Angeles counties, California; it is traversed by railroads, and, for the greater part, good highways; it has excellent soil and a good climate, and quite extensive studies have been made, by the United States Geological Survey and by the State of California, of the ground waters. The several bulletins published on the subject are most instructive and interesting.

Senator Shortridge will introduce a bill in the next session of congress, asking for an appropriation sufficient to purchase drilling rigs and to operate them for a period of at least three years. The general plan of operation will be to select several widely separated areas over the Mojave Desert, and to drill wells to the water tables underlying them. Pumping tests will be made to determine the water production of the wells, and this data will be a part of the records in the United States land office. These records will assist the homesteader in determining the shallower water areas.

IN AREAS where it is found that water is too deep for economic water lift, drilling will cease, and the rigs will be concentrated on those areas where more favorable water conditions exist. In time the deep water areas will be determined and abandoned, and a reasonable number of wells drilled in the shallower water areas. We must always bear in mind that the water underlying the Mojave Desert is not inexhaustible. The water is limited, and should not be drawn on beyond the recharge supplied by the run-off from the mountains and the slight amount of water that sinks into the ground from the annual precipitation on the desert. If too many wells are pumped in any area the water table will be lowered below the economic water lift, and the whole district will suffer in consequence. It is not simply the depth to water that is important, but the quantity of water available in a particular area that must be considered. The number of acres that can be irrigated will depend upon the quantity of water to be found at a distance below the surface that will justify pumping for irrigation.

A definite and detailed plan whereby the homesteader will reimburse the government for the cost of drilling wells has not been worked out. Probably the homesteader will be allowed to make annual payments for a period of ten years or longer. The same plan will also be extended to include the drilling of wells on lands already proved up. The cost of these wells, in this way, will be returned to the government, and the drilling of wells will be extended to other desert territories.

THERE are approximately 1,200,000 acres of vacant government land remaining in the Mojave Desert, Antelope Valley, and the arms running out from them. Probably ten per cent of this area can ultimately be reclaimed by pump irrigation. The remaining ninety per cent will be a problem for some future generation to solve. I will say in passing, however, that, with the increasing demand for land, year by year, we hope to see the indigenous plants developed and improved until a considerable acreage can be put to a useful purpose without irrigation—or with very little irrigation. We believe important results could be accomplished if an experiment station were established, at some point in the Mojave Desert, where the Department of Agriculture and the State of California could experiment with the native desert plants.

If we are to extend the irrigated areas of the Mojave Desert, by pump irrigation, it will require industrious and careful effort. If this project is to succeed hard-headed practical methods are necessary. Every drop of water pumped must be put to its most useful purpose; and care must be taken to plant only such crops as will require the least water for the greatest market value. The careless farmer will never succeed on the desert.

We are hoping that Congress will make an appropriation to drill wells over the Mojave Desert. We have the utmost faith in the success of the project, and in a few years hope to see thousands of acres brought under cultivation, where many of our citizens will be made independent and happy—with "a piece of land" all their own.

APPROVE RIVER STUDY

Officials of the Sacramento and San Joaquin River Problems Conference and the California State Division of Water Rights have approved plans for continuing the study of the water problems of these two California rivers during the coming year. The work of the conference was begun last year at the instance of transportation interests and water users, and involves keeping a record of water diversion for irrigation purposes and a close study of water duty. A scientific study of evaporation will be conducted during 1925 as well.

IRRIGATION FINANCE

ADEQUATE FARM LOANS FOR IRRIGATED LANDS

2. Financing Lands Under Established Projects

By B. J. SEGER

In the July number of MODERN IRRIGATION *Mr. Seger discussed the problem of securing farm loans for lands under new irrigation projects. The following article is the second of a series, and is devoted to methods of organizing to secure loans under older and well-established irrigation projects.*

IT SHOULD not be so difficult to secure loans on lands under established irrigation projects as under new projects, for the reason that practically all of the land is under cultivation and has been cropped long enough to demonstrate its productivity. There has been time to level the land, enrich the soil, and build an adequate system for distributing the water to the land in the most economical manner to the individual farm. The seepage, if any, has had time to develop, and necessary drains have been provided for its disposition. Considerable money has been expended in one kind of improvement or another.

An experienced land appraiser would be in position to recommend an amount that would be safe to loan on the land, provided the amount of bonded or construction debt and floating debt were not too heavy per acre and provided the owner was not too heavily encumbered otherwise with high interest bearing debts. The appraiser would also want to know the plan for repayment of the bonded or construction debt—whether the payments would eventually be in excess of the economic limit of the land to pay.

IF IT were found that the yearly per acre payment was so large that it would require all the average net returns from the land to pay the yearly charge, then no matter how well the farm was located nor how productive, he could not advise his loan company to make loans on lands under the project carrying too heavy a yearly per acre charge. It is, therefore, just as important that careful consideration be given to the financial condition of the older projects as that of the new projects. It is also just as important to make sure that the canal system is in a good state of repair.

It might be advantageous and advisable to refinance the project, refunding the present bond issue into a serial bond spread over as many years for repayment as needed to reduce the payments to a point where the yearly payments can be easily met. It may be that there is a large floating debt such as warrants, running for two to three years before payment, as well as other indebtedness bearing a high rate of interest.

IT IS important, if an irrigation district is to be successfully refinanced, that the irrigation laws provide that an irrigation district may fund its warrants into a bond ssue when advantageous to do so. A short time serial bond could be issued to take up the warrants and other floating indebtedness, the bonds sold and the district placed on a cash basis. There would be no necessity for making an extra levy for a funding bond issue, for the reason that levies have been made for all outstanding warrants, which are in the form of unpaid taxes.

Even with the finances of the district placed in the best possible condition, loan agencies are not willing to make loans on such lands under some projects because of a rather high bond or construction debt per acre.

Then again, there are about fifty per cent of the lands on irrigated projects farmed by tenants, and such owners cannot secure loans from the Federal Land Bank. The Joint Stock Land Bank will not make loans on irrigated land at the present time, and other loan agencies are slow in coming into irrigated territory to make loans.

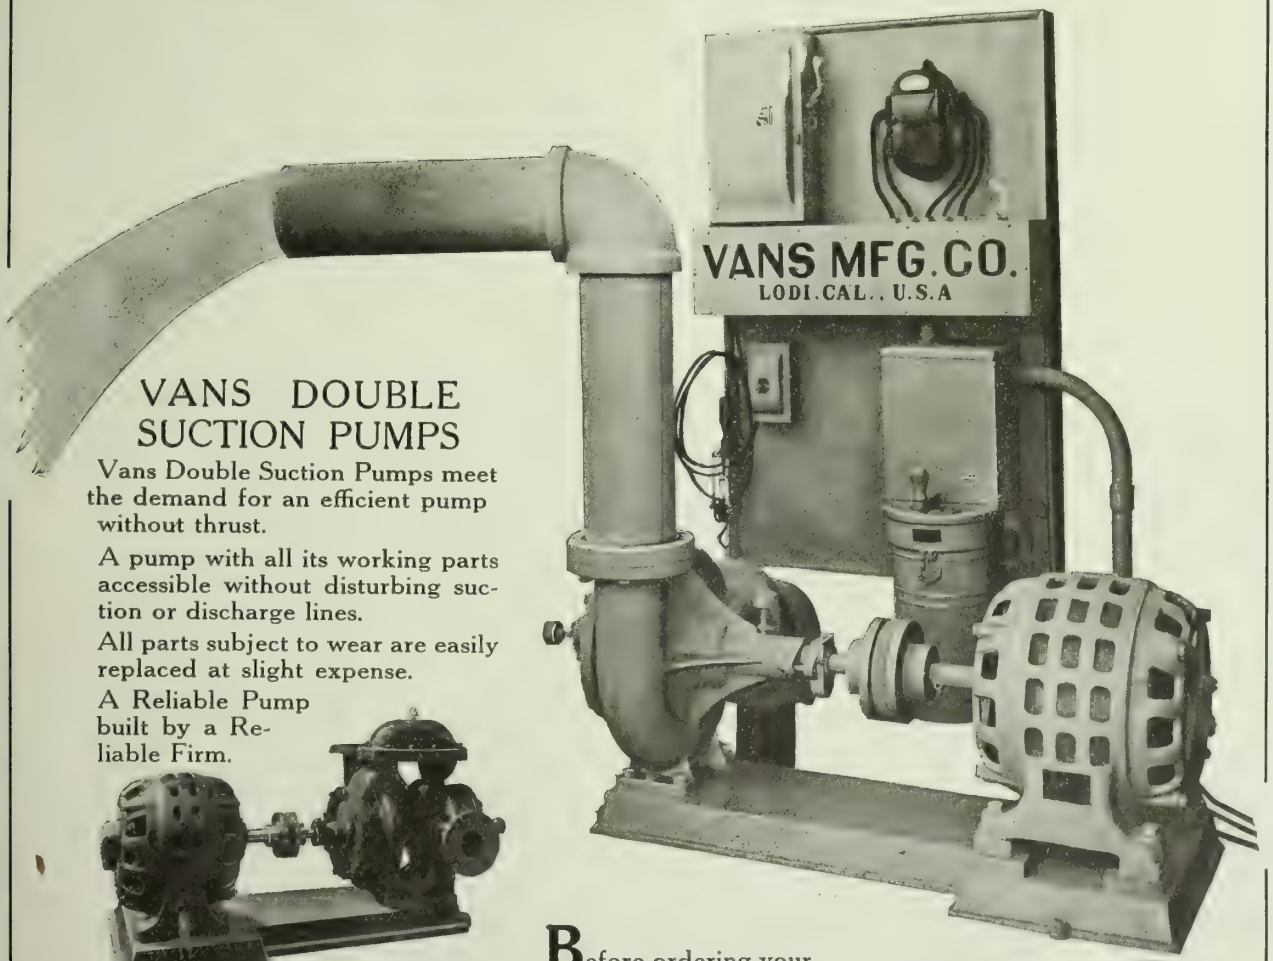
It would seem, therefore, that some way should be provided for the fifty per cent of landowners who are not in position to avail themselves of the Federal Land Bank loans to secure loans locally on practically the same terms. It is important that the tenant also be taken into consideration in making provision for securing loans at a low rate of interest.

The first plan of securing additional credit which I wish to consider is that of organizing an Agricultural Credit Corporation. I would consider this plan practical only for larger irrigation projects. Such a corporation can be organized with five or more persons, and is very much the same as any corporation, in its organization and purpose, with the exception that it is under the supervision of the United States Comptroller of Currency and that the organization must be approved by him. Provision is made in the Federal Land Bank Act for such a corporation. An Agricultural Credit Corporation can be organized with a paid up capital of $10,000.00, but it is recommended that the Corporation be organized with a paid up capital of $250,000.00, for the reason that the corporation would be in position to begin making loans at once, while if the corporation were to be started with the smaller capital, but few loans could be made at the start. This type of corporation operates in some respects like a bank—it may discount notes, warehouse receipts and other paper, and may borrow money at a rate not to exceed the legal rate for the State.

Inasmuch as the Agricultural Credit Corporation is for the purpose of assisting the farmer, all loans must be for agricultural purposes—the purchase of livestock and building improvements. If sufficient funds could not be raised from the sale of stock in the beginning, the same plan could be used which was mentioned for new projects, that of securing the loan of the credit of the State for funds equal to the amount of paid up capital. The loans made by the Agricultural Credit Association should be for from one to three years with approved security. Such an organization should include considerable territory, such as an entire county or a large project having from fifty to one hundred and fifty thousand acres of irrigable land. An organ-

VANS PUMPS

Mean More Gallons per Horse Power



VANS DOUBLE SUCTION PUMPS

Vans Double Suction Pumps meet the demand for an efficient pump without thrust.

A pump with all its working parts accessible without disturbing suction or discharge lines.

All parts subject to wear are easily replaced at slight expense.

SAN FRANCISCO

ization of this kind, if well established, and after it had gained a credit standing with the Federal Reserve Banks, would have no difficulty in securing funds for loan purposes.

ON RECLAMATION projects, not only the credit of the State might be secured, but also that of the Government. Reclamation funds might be loaned for this purpose. That fund receives one million dollars per month from the sale of public lands and oil leases in western States. It would be entirely reasonable to ask that the Government loan to its own Reclamation projects, where an Agricultural Corporation or a Mutual Loan Association had been properly organized, an amount equal to the paid up capital of the organization—on the dollar matching plan.

With the money borrowed from the State or the Reclamation fund as the case might be, added to that received from the sale of stock, funds would be available in a comparatively short time, ample for loan purposes. When the loans and interest began to be repaid, a revolving fund could be built up, to such an amount that all of the stockholders could be granted loans sufficient for their needs.

The enactment into law of the new Reclamation Bill, known as the "Fact-finders Bill," has brought new hope and courage to landowners under reclamation projects. It would be a most opportune time for landowners under reclamation projects to organize an Agricultural Credit Corporation or a local loan agency of some kind. There is no question but that a strong organization could be built up in a few years which would be of material help to the entire community.

A second plan would be the organization of a Mutual Loan Association. An organization of this kind would be more satisfactory for the smaller projects, or landowners on several of the smaller projects might join together and organize on Agricultural Credit Corporation which would serve the needs of all.

With an organization of the kind best adapted for the community, to assist the landowner on irrigation projects in securing one to three year loans at 5 to 6 per cent for the purchase of livestock or improvements, the landowner would, in a few years, be on a first-class financial basis.

IT MIGHT be desirable for some of the landowners to secure loans running over a long period of time before repayment. Such landowners could not do better than to avail themselves of the Federal Land Bank loan or loans of a similar nature having the amortized feature and carrying a low rate of interest.

No project can be an entire success, no matter what the plan of financing may be, unless some definite system is established for the collection of irrigation taxes each year. The present law of Nebraska provides that an irrigation district board may refuse to deliver water to landowners who owe more than one year's tax. Many irrigation districts in the west require that the irrigation tax be paid before water is turned to the land. This plan seems to be the best for all concerned, it would tend to keep such district on a cash basis, and the landowners would be saved a considerable amount each year in interest and discounts if taxes were collected when due.

To one selling securities of an irrigation district, it is apparent that district boards must in the future make definite and sustained effort to collect irrigation taxes or irrigation securities will be considered by financial organizations as too great a risk for safe investment. Should such organizations take this view of irrigation securities it would tend to bring about financial disaster to districts whose boards are lax in collections, which would also reflect discredit on all irrigation district securities.

The irrigation law in Nebraska provides a remedy where taxes are not paid when delinquent—the tax sale and the foreclosure. Tax sales bring in money to the district but the individual landowner suffers in the payment of 12 to 15 per cent interest. No land owner can pay that interest for any length of time and succeed in his farming operations. A district having many tax sales each year would be looked upon by purchasers of securities as unsafe. It would be difficult to secure a loan on lands on which there were tax sales; it would indicate the owner's inability to pay.

SOME irrigation districts have made a special effort to collect one year of tax each year before water is turned to the land. The officers of these districts feel well repaid for the effort made, and it is quite certain that they would not think of relaxing in their efforts to secure the payment of taxes. They feel that the time is past when a landowner should continue to receive water, year after year, if he makes no effort to pay his taxes.

These districts have found that it has made a marked difference in the item of the sale of warrants. Such districts, which have been making an effort to collect taxes, found that their warrants sold readily at a good price while warrants of districts making no effort to collect, although no further behind in the payment of warrants, were a drug on the market.

Two *Distinct* Advantages

Which are enjoyed by those who advertise NOW in MODERN IRRIGATION

First—Your product, and the company behind it, become immediately identified with and for the irrigation movement in a larger sense, by being represented in Irrigation's own publication from the outset. *Not* to advertise now places you in the class of those who—ostensibly at least—are not leaders, and who do not aspire to aggressive leadership in an industry which is contributing, more than any other, to the upbuilding of a great agricultural and industrial empire.

Second—Your campaign, appearing NOW, will be seen by men whose annual purchases aggregate millions; and who are planning today vast expenditures through the coming Fall and Winter season. The men who will be buying heavily in November, December and January are planning their expenditures at this very moment. Consciously, or unconsciously, they are forming their opinions, making their decisions. Here, in these pages, many a preliminary "skirmish" of competition will take place—many a silent victory will be won—months before the salesman calls.

These, therefore, are two *distinct* advantages to be gained through long-pull advertising now. Would you like to know about still other advantages, including information as to rates, circulation, etc.? If so, it's a simple matter to write a note or a telegram of inquiry. No obligation whatever is involved.

OVERHEAD IRRIGATION

CITRUS INSTITUTE DISCUSSES SOIL MOISTURE

PROBLEMS of irrigation in general and overhead irrigation in particular received a great deal of attention at the Fourth Annual Southern California Citrus Institute, which met at Anaheim recently.

A varied program of papers and reports dealing with many phases of the economics of citrus culture had been worked out to make a well-rounded appeal to the more than four hundred growers and citrus workers who gathered for the two-day session; but the questions of irrigation were among the most interesting of those discussed.

Harold E. Wahlberg, Farm Advisor of Orange County, in delivering the first paper of the meeting, touched briefly on the high lights to be developed in more detail in subsequent discussions. He dealt with irrigation as one of the six essentials to successful citrus fruit culture, discussing it under the head of "soil moisture control."

"Too many of us," declared Mr. Wahlberg, "in the past have been inclined to consider orchard irrigation practice as separate and apart from other phases of tree management, but as we investigate the many conditions confronting individual trees and groups of trees we find that soil moisture control or irrigation practice is closely associated with available soil fertility, tree diseases, wind protection, cultivation and even pest control.

"EXCEPT for the first essential, a tree of good parentage, I would place soil moisture control next in importance because of its close bearing on the other essentials, and the question of soil moisture control is one of economics. The cost of water is influenced by the amount used at each application and throughout the year. If we are using 25 to 50 per cent more water than is actually needed to penetrate the three or four feet of root zone, then we are extravagant in the amount of water used. Not only that, but the cost of pumping is increased, the wear and tear on the machinery, the extra fuel charge, and greatest of all is the loss through leaching of the soil fertility. The valuable plant foods that are necessary for tree life are in soluble form. The portion of these soluble plant foods in the soil is materially affected by the movement of water. If we carry these solutions down below the root systems of the trees we are materially cutting down the amount of foods available to the trees. This is particularly true in the lighter soils and in the loam soils.

"Now, how about the heavy clay and adobe soils? The same axiom quoted above holds true except in a different way. If the heavier soils are kept continually saturated with moisture the roots become inactive, sluggish, soil flora and bacteria become inactive and in extreme cases the roots will rot. Roots in this condition of course cannot supply the necessary food solution to the tree and as a consequence tree growth stops, leaves turn yellow and finally defoliate.

"Every soil and every orchard presents a problem of its own in determining the proper method of distribution of water and it behooves the grower to study more closely the behavior of moisture penetration in his particular soil which can only be done by means of trenching or boring with a soil auger and shovel. We have been too much concerned with the upper half of the tree and have in many cases neglected the conditions affecting the lower half of the trees which is below the surface of the ground."

THE principal feature of the discussion of overhead irrigation was contributed by Professor H. A. Wadsworth, of the University of California. Professor Wadsworth is assistant in the Division of Irrigation Investigations and Practice of the College of Agriculture, and has been working for several months in a thorough-going research study of the relation of overhead irrigation to soil moisture conditions.

His paper was the first official statement that has been made since the beginning of the investigations, and was consequently greeted with great interest.

Introducing his paper Prof. Wadsworth pointed out that "interest in overhead sprinkling as a means of orchard irrigation has developed with amazing rapidity in southern California during the past two years," and spoke briefly of the efforts made by such agencies as the weather bureau, packing houses, and the state university to study some of its problems. The message of his paper was primarily a plea for a more scientific study of overhead irrigation in all its aspects, in order that its advance should be free from distorted and exaggerated claims of its advantages.

"ALTHOUGH no conclusion can be drawn from the work at this time," said Prof. Wadsworth, speaking of the experiments which are being made under his supervision with sprinkler systems, "we have some indication that a satisfactory soil moisture condition may be maintained by sprinklers." This is his summary of the work undertaken by his department:

"The Division of Irrigation Investigations and Practice of the College of Agriculture has undertaken to determine the moisture distribution which results from overhead sprinkling as practiced on two of the common citrus soils of Los Angeles and Orange Counties.

"Before the details of the procedure of these investigations be discussed it is essential that one have a clear conception of those principles of soil moisture distribution which are active when a soil is wetted either by natural rainfall or by artificial means. It will be recalled that the amount of water a soil can hold against the downward pull of gravity varies with the fineness of the individual particles that go to make up the soil mass. The decomposed granites of the Sierra Madre Foothills are remarkably low in their water holding capacities since the individual particles are relatively large. The soil of the Whittier and La Habra area are much more finely divided; their water holding capacity is consequently far greater.

CAMPBELL
OVERHEAD IRRIGATION

DISTRIBUTES the water applied in the form of small drops just like a gentle rain—not in a mist that will be lost by evaporation or in a deluge that will wash the soil.

Gives a 100% distribution over the entire area irrigated. Apply an inch or less of "rain"; let it stand for a few hours and dig where you will and not a spoonful of dry earth can be located.

Requires less than half the water necessary for the ditch or furrow system where there is an immense waste on account of varying texture of soil and run-off.

Affords an immense saving in labor. Simply open the valves and let it "rain" on a section of one, five or ten acres for a few hours—then shut off and turn on another section. No furrowing needed in advance of irrigating.

Obviates the necessity of terracing and contour planting—even on the steepest hillsides. Trees can be planted square and every drop of water applied will soak in.

Prevents and disintegrates plow-sole—thus making sub-soiling and deep cultivation unnecessary.

Absolutely prevents damage from wind-burn. Moisture carried by the wind will entirely check evaporation from the leaves and fruit.

Saves the expense of spraying for red spider and other insects and by keeping the trees in a healthy condition will make all, or practically all, fumigation unnecessary.

Prevents June drop by eliminating the evaporation from the trees that causes it.

Gathers nitrogen from the air and forces downward distribution of nitrates and soluble parts of manure that have been applied near the surface. It also carries humus in solution below ploughed depth to all deep-lying roots.

We make complete guaranteed installations including pumping equipment for boosting machinery if desired or will sell you the necessary equipment, make your plans and superintend installation.

BOOKS *of* PRACTICAL VALUE *to the* WATER USER *and the* HYDRAULIC TECHNICAL MAN

IRRIGATION ENGINEERING

By ARTHUR POWELL DAVIS, D. SC.
Chief Engineer and General Manager, East Bay Municipal Utilities District; formerly President Am. Soc. C. E.; formerly Director and Chief Engineer, U. S. Reclamation Service.

AND

HERBERT M. WILSON, C. E.,
Mem. Am. Soc. C. E.; former Chief Engineer and Irrigation Engineer, U. S. Geological Survey.

Seventh Edition, Revised and Enlarged; Total Issue 12,000

THIS IS a rewritten and rearranged edition with much new material added. The principal difference introduced is the treatment of soils, plant food, operation and maintenance, and other lines of work where the duties of the irrigation engineer come in contact with the irrigator, such as in the preparation of land, the duty of water and its application to the land. A bibliography of standard works is given at the end of each chapter. 640 pages. 6 by 9. 249 figures and illustrations. Cloth, $4.50 net postpaid. Remittance must accompany the order. Allow from one to two weeks for transmittal of order and shipment from the publishers.

IRRIGATION PRACTICE *and* ENGINEERING

By G. A. ETCHEVERRY,
Professor of Irrigation Engineering, University of California.

In three volumes—the most comprehensive work in the field. A wealth of information of both practical and informative value for everyone interested in water development and conservation. Prices are net postpaid and remittances must accompany order. Allow from one to two weeks for transmittal of order and shipment from the publishers.

Vol. 1.—Uses of Irrigation Water and Irrigation Practice.....$2.50
Vol. 2.—Conveyance of Water..... 4.00
Vol. 3.—Irrigation Structures and Distribution System..... 4.50

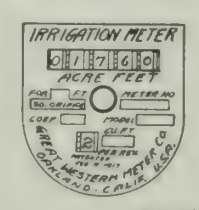
A GREAT WESTERN *Irrigation Meter*



will solve your measurement problems

It is on the job day and night. It is not affected by silt or trash. Meter is geared for orifice of any size (1-10 sq. ft. to 100 sq. ft.)

GREAT WESTERN METER COMPANY
1290 Powell Street
Oakland California

"It can be stated as an accepted fact that no water can be made available for the root development in the third and fourth foot until the upper two feet have been filled to their maximum water holding capacities. Furthermore, soil physicists and plant physiologists have discovered that plants wilt when the soil moisture content has been depleted to 55 percent of its maximum capacity remaining in the soil. This remaining moisture is so closely held to the individual soil particles by surface tension, and other forces, that it cannot be torn away by the absorptive power of the roots.

"With this conception of the soil moisture relations the problem of determining the effectiveness of irrigation by overhead sprinkling resolves itself into a series of soil sampling operations throughout the normal irrigation season. If such samplings demonstrate that sprinklers can be relied upon to wet any soil to the depth of the feeding roots in a reasonable period of application, without excessive losses by surface runoff and without surface erosion or compacting it can be claimed that sprinkler irrigation is effective in creating and maintaining a desirable soil moisture content.

"In the investigations indicated above six groves have been selected for intensive soil moisture studies. Three of these lie on the decomposed granite soils of the Sierra Madre Foothills; three lie in the new zone of sprinkler development, on the clay loams of the La Habra and Montebello areas.

"Four sets of samples have now been taken from the six groves and subjected to our usual soil moisture analysis. The last samples were taken immediately before and immediately after an irrigation in order that the effect of the irrigation upon soil moisture increases might be noted without the necessity for correcting for losses between the date of irrigation and the date of sampling. Although no conclusion can be drawn from the work at this time we have some indication that a satisfactory soil moisture condition can be maintained by sprinklers upon the two soils under consideration. To accomplish this result it has become apparent that some care must be used in determining the duration of run and the frequency of application. But with careful management and with frequent use of the soil auger and shovel sufficient penetration can probably be secured with the most difficult soils.

"The effect of continuous year in and year out irrigation by sprinklers upon the physical condition of these heavy soils can only be conjectured. We have no evidence that compacting of the sur-

face will result nor have we evidence that the continuation of this practice will not increase the impervious nature of these heavy soils and render their management more difficult."

Prof. Wadsworth dealt briefly with the problems of evaporation, fertilizer distribution, pest and disease control, temperature control, and the relation of sprinkling to the quality of the fruit, pointing out, in each case, that while great advantages have been claimed in relation to these factors by enthusiastic irrigators, there is a need for a careful and scientific investigation of the whole subject.

IN CONCLUSION he discussed sprinkler economics, declaring:

"Sprinkler installations are costly especially when a permanent installation is desired in locations where pressure is not available and where a booster pump must be resorted to. Economic justification for such a system can only be secured when cash values are given to each of the benefits to be gained by the proposed system and when the sum of the annual benefits exceeds the carrying charges on the system.

"Credit for many of the advantages of overhead sprinklers may easily be expressed in dollars and cents. The cost of furrowing out and the labor of applying the water which are items of saving by sprinklers are easily computed. Such advantages as uniformity of fertilizer distribution, and the probable improvement in the quality of fruit produced under sprinklers can be only roughly estimated in cash value.

"The carrying charges for such a system can be closely computed. It is fair to assume, I believe, that twenty years is the probable life of a modern sprinkler installation. During every year a sum of money should be laid aside which is equal to one-twentieth of the capital investment. Within twenty years the original capital will be returned to the owner. Interest charges should also be considered and the system should each year pay interest at, say, 6 per cent on that part of the capital investment which has not found its way into the sinking fund. In this way the annual carrying charges decrease annually during the life of the system. To this carrying charge must be added maintenance charges and replacement costs.

"By this analysis the annual cost of operating a sprinkler system can be determined. If this average annual cost is greater than the sum of the cash value of the benefits the system is not economical and the difference must be charged to convenience of operation."

SURVEY *of* IRRIGATION DEVELOPMENT

As Shown by Official Records of the Month -- Local, State, and Governmental

OFFICIAL RECORDS PROMISE BIG-SCALE ACTIVITY

AMONG the permits to appropriate water issued by the Department of Public Works, Division of Water Rights of California during the month of June, 1925 were the following:

Permit No. 2114, Application No. 3575 (San Bernardino County). Issued to Bertram W. Jack, Los Angeles, Calif., June 8, 1925, for 0.20 cubic foot per second from an unnamed canyon in Sec. 9, T 2 S, R 1 W, for domestic use and irrigation of 160 acres in Section 7 and 8. Estimated cost $10,000.00.

Permit No. 2117, Application No. 4355 (Sutter County). Issued to Eliza Smith, Berkeley, California, June 19, 1925, for 5.57 cubic feet per second from Sacramento River in Section 15, T 14 N, R 1 E, for irrigation of 366 acres near point of diversion. Estimated cost $1000.00.

Permit No. 2118, Application No. 4144 (Del Norte County). Issued to Ed. Hight, Smith River, Calif., June 22, 1925, for 1 cubic foot per second from Morrison Creek in Section 36, T 18 N, R 1 W, for domestic use and irrigation of 80 acres in Section 25. Estimated cost $1000.00.

Permit No. 2119, Application No. 3687 (Calaveras County). Issued to Frank Becker, West Point, Calif., June 23, 1925, for 6 cubic feet per second from Licking Fork in Section 18, T 6 N, R 14 E, for power purposes in Section 18, propose to develop 75 T. H. P. Estimated cost $1000.00.

Permit No. 2120, Application No. 2992 (San Diego County). Issued to the City of San Diego, San Diego, Calif., June 24, 1925, for 1200 acre feet per annum from Flume Nine Creek in Section 28, T 17 S, R 3 E, for municipal purposes in city of San Diego. Estimated cost $1,300,000.00.

Permit No. 2121, Application No. 2993 (San Diego County). Issued to the City of San Diego, San Diego, Calif., June 24, 1925, for 1800 acre feet per annum from Rattlesnake Creek in Section 33, T 17 S, R 3 E, for municipal purposes in city of San Diego.

Permit No. 2122, Application No. 2994 (San Diego County). Issued to The City of San Diego, San Diego, California, June 24, 1925, for 2,000 acre feet per annum from Tunnel Two Creek in Section 5, T 18 S, R 3 E, for municipal purposes in City of San Diego.

Permit No. 2123, Application No. 2995 (San Diego County). Issued to The City of San Diego, San Diego, California, June 24, 1925, for 2,000 acre feet per annum from Matchin Creek in Section 12, T 18 S, R 2 E, for municipal purposes in City of San Diego.

Permit No. 2124, Application No. 3186, (Humboldt County). Issued to Charles Martin, Blocksburg, California, June 24, 1925, for 0.025 cubic feet per second from Conley Creek in Section 21, T 2 S, R 5 E, T.M. for irrigation of 25 acres in Section 28. Estimated cost $1,000.00.

Permit No. 2130, Application No. 4170 (Contra Costa County). Issued to R. W. Newell, Walnut Creek, California, June 26, 1925, for 0.5 cubic foot per second from Walnut Creek in Section 34, T 1 N, R 2 W, for irrigation of 50 acres near point of diversion. Estimated cost, $1,000.00.

Permit No. 2132, Application No. 4149 (Santa Barbara County). Issued to K. C. Wallace, Los Angeles, California, June 29, 1925, for 0.34 cubic foot per second from two small streams in Section 24, T 11 N, R 30 W, for domestic use and irrigation of 60 acres in Section 13. Estimated cost $2,000.00.

Permit No. 2135, Aplication No. 3500 (Butte County). Issued to George B. Champlin, et al, Red Bluff, California, June 30, 1925, for 16.37 cubic feet per second from Sacramento River in Section 1, T 23 N, R 2 W, for domestic use and irrigation of 1310 acres near point of division. Estimated cost $26,000.00.

Permit No. 2137, Application No. 4289 (Los Angeles County). Issued to Richard Dvorak, Littlerock, California, June 30, 1925, for 0.15 feet per second from underground water to be developed in Section 17, T 4 N, R 10 W, for domestic use and irrigation of 40 acres in Section 8. Estimated cost $1,000.00.

Permit No. 2139, Application No. 4409 (Siskiyou County). Issued to J. L. Jones, Edgewood, California, June 30, 1925, for 200 acre feet per annum from Shasta River in Section 25, T 43 N, R 5 W, for irrigation of 152 acres near point of division. Estimated cost $5,000.00.

Permit No. 2142, Application No. 4291 Sacramento County). Issued to Ralph Moore, Sacramento, California, June 30, 1925, for 1.75 cubic feet per second from Sacramento River in Section 26, T 7 N, R 4 E, for irrigation of 140 acres near point of diversion. Estimated cost $1,000.00.

Permit No. 2143, Application No. 4292 (Sacramento County). Issued to Mrs. Annie Hack, Sacramento, California, June 30, 1925, for 2.50 cubic feet per second from Sacramento River in Section 13, T 7 N, R 4 E, for irrigation of 200 acres near point of diversion. Estimated cost $2,000.00.

APPLICATIONS

Among the applications for permit to appropriate water filed with the State Department of Public Works, Division of Water Rights, (California) during the month of June were the following:

Application No. 4612 (Sonoma County)—G. T. Rickman, c/o, Floyd D. Darby, Healdsburg, California, for 0.19 cubic foot per second from Mill Creek, tributary to Dry Creek, to be diverted in Section 30, T 9 N, R 9 W, M.D.M., for agricultural purposes on 15 acres in Sections 30 and 31, T 9 N, R 9 W, M.D.M Estimated cost, $1,000,00

Application No. 4613 (Sutter County)—Percy T. Hincks, Yuba City, California, for 0.5 cubic foot per second from Sacramento River, tributary to Suisun Bay, to be diverted in Section 16, T 14 N, R 1 E, M.D.M., for agricultural purposes on 40 acres in Section 15, T 14 N, R 1 E. Estimated cost, $17,500.00.

Application No. 4614 (Humboldt County)—Michael R. Morres, Orleans, Humboldt County, California, for 2½ cubic feet per second from Wilson Creek, tributary to Klamath River, to be diverted in Section 17, T 11 N, R 6 E, H.M., for mining purposes in Sections 19, 29 and 30, T 11 N, R 6 E, H.M. Estimated cost, $10,000.00.

Application No. 4616 (Trinity County)—Karl Albiez, Hayfork, Trinity County, California, for 1.12 cubic feet per second from Hayfork Creek, tributary to South Fork Trinity River, to be diverted in Section 11, T 31 N, R 12 W, M.D.M., for agricultural purposes on 90 acres within Sections 10 and 11, T 31 N, R 12 W, M.D.M. Estimated cost, $1,500.00.

Application No. 4617 (Ventura and Los Angeles Counties)—A. D. Schindler, 1104 Balfour Bldg., San Francisco, for 200 cubic feet per second and 75,000 acre feet per annum from Piru Creek, tributary to Santa Clara River, to be diverted in Section 30, T 7 N, R 18 W, Section 3, T 6 N, R 18 W, Section 34, T 5 N, R 18 W, S.B.M., for agricultural purposes in Valleys of Bucks and Santa Clara River between Piru and Fillmore.

Application No. 4618 (Ventura County)—A. D. Schindler, 1104 Balfour Bldg., San Francisco, for 200 cubic feet per second and 111,800 acre feet per annum from Sespe Creek, tributary to Santa Clara River, to be diverted in Section 6, T 5 N, R 22 W, Section 36, T 6 N, R 20 W, Section 2, T 4 N, R 20 W, S.B.M., for agricultural purposes in Valleys of Sespe Creek and Santa Clara River between Fillmore and Saticoy.

Application No. 4619 (Ventura County)—A. B. Schindler, 1104 Balfour Bldg., San Francisco, for 200 cubic feet per second and 101,000 acre feet per annum from Sespe Creek, tributary to Santa Clara River, to be diverted in Section 6, T 5 N, R 22 W, and Section 36, T 6 N, R 20 W, S.B.M., for generation of hydro-electric energy.

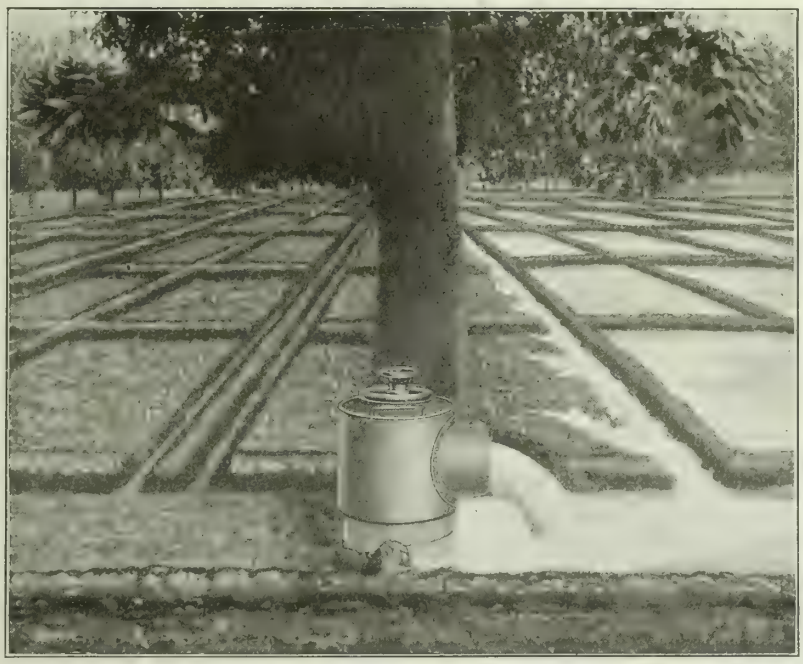
Application No. 4620 (Ventura and Los Angeles Counties)—A. D. Schindler, 1104 Balfour Bldg., San Francisco, California, for 200 cubic feet per second and 75,000 acre feet per annum from Piru Creek, tributary to Santa Clara River, to be diverted in Section 30, T 7 N, R 18 W, Section 3, T 6 N, R 18 W, S.B.M., for generation of hydro-electric energy.

Application No. 4627 (Napa, Solano, Lake Counties)—C. A. Tusch, 2211 Union Street, Berkeley, California, for 400 cubic feet per second and 300,000 acre feet per annum from Putah Creek, tributary to Sacramento River, to be diverted in (direct) Section 26, T 8 N, R 2 W; (storage) Section 29, T 8 N, R 2 W, Section 13, T 11 N, R 6 W, M.D.M., for agricultural purposes on 60,000 acres in T 7 and 8 N, R 1 W, and T 7 and 8 N, R 1 and 2 E, M.D.M.

Application No. 4628 (Santa Barbara County)—Union Sugar Co., c/o McKinstry Haber & Firebaugh, 703 Market Street, San Francisco, California, for 10.54 cubic feet per second from San Antonio Creek, tributary to

· SNOW ·

IRRIGATION & WATER CONTROLLING APPLIANCES



The SNOW PORTABLE HYDRANT, used with the Snow Ideal Valve, insures perfect control of the water in "flood" irrigation. Uniform wetting, the goal of the Irrigationist, follows naturally.

The Hydrant provides a waterway equal to the full capacity of the pipe. It is light in weight and therefore easily handled. It may be set to face any direction and is operated entirely by two hand wheels; the smaller one locks the hydrant on the valve; the other opens and closes the valve.

Pacific Ocean. The points of diversion lie between Sta. 1 and Sta. 170 on San Antonio Creek, to be diverted from (1) NW Corner, T 8 N, R 34 W, to (2) Section 8, T 8 N, R 35 W, S.B.M., for agricultural purposes on 843 acres within Sections 8, 15, 16 and 17, T 8 N, R 35 W, S.B.M. Estimated cost, $3,000.00.

Application No. 4629 (Butte County)—A. G. Eames, Trustee Butte Creek Project, Chico, California, for 500 cubic feet per second and 100,000 acre feet per annum from Butte Creek, tributary to Sacramento River, to be diverted in Section 4, T 21 N, R 2 E, M.D.M., for agricultural purposes on 40,000 acres within T 22 N, Rs 1 E and 1 W, T 21 N, Rs 1 and 2 E, T 20 N, Rs 1 and 2 E.

Application No. 4630 (Trinity County)—James B. Knight, Fred M. Kay, J. L. Stone, W. H. Haw, Frank Breeden and David Wilson, c/o James B. Knight, 304 DeYoung Bldg., San Francisco, California, for 62.5 cubic feet per second from New River, tributary to Trinity River, to be diverted in Section 33, T 7 N, R 7 E, H.M., for generation of hydro-electric energy within Sections 35, T 6 N, R 6 E, H.M. Estimated cost, $55,000.00.

Application No. 4635 (Contra Costa County)—Alfred S. Ferguson and William C. Ferguson, c/o Ohm & Raab, 517 E. Market Street, Stockton, California, for 12.21 cubic feet per second from Old River and Western Canal, tributary to San Joaquin River, to be diverted in (1) Section 20, T 1 S, R 4 E, (2) Section 29, T 1 S, R 4 E, M.D.M., for agricultural purposes in Sections 19, 20, 29 and 30, T 1 S, R 4 E, M.D.M. Estimated cost, $11,000.00.

Application No. 4636 (San Joaquin County)—Mrs. Anna Bautz, c/o Ohm & Haab, 517 East Market Street, Stockton, California, for 2.00 cubic feet per second from Middle River, tributary to San Joaquin River, to be diverted in Section 13, T 1 S, R 5 E, M.D.M., for agricultural purposes on 160 acres within Sections 13 and 24, T 1 S, R 5 E, M.D.M.

Application No. 4637 (San Joaquin County) Caroline Moran, c/o Ohm & Raab, 517 East Market Street, Stockton, California, for 12.44 cubic feet per second from Middle River, tributary to San Joaquin River, to be diverted in Section 23, T 1 S, R 5 E, M.D.M., for agricultural purposes on 995.5 acres in Sections 10, 15 inclusive, 22 and 23, T 1 S, R 5 E, M.D.M. Estimated cost, $9,000.00.

Application No. 4640 (Kern County)—H. E. Seaton, 3004 Council Street, Los Angeles, California, for 0.5 cubic foot per second of underground water, tributary to Sand Canyon, to be diverted in Section 8, T 25 S, R 38 E, M.D.M., for agricultural purposes on 40 acres in Section 10, T 25 S, R 38 E, M.D.M. Estimated cost, $3,000.00.

Application No. 4643 (San Diego County)—La Mesa, Lemon Grove and Spring Valley Irrigation District, c/o Thomas H. King, 920 Eight Street, San Diego, for 5.0 cubic feet per second and 100,000 acre feet per annum from San Diego River, tributary to Pacific Ocean, to be diverted in Section 7, T 15 S, R 2 E, S.B.M., for agricultural purposes on 20,000 acres.

Application No. 4647 (Fresno County)—San Joaquin Light and Power Co., Fresno, California, for 720 cubic feet per second from North Fork of Kings River, tributary to Kings River, to be diverted in Section 12, T 12 S, R 26 E, M.D.M., for generation of hydro-electric energy in NW ¼ of Section 11, T 12 S, R 26 E, M.D.M. 33136 T.H.P., to be developed. Estimated cost, $1,850,000.

Application No. 4648 (Fresno County)—San Joaquin Light & Power Co., Fresno, California, for 220 cubic feet per second, from North Fork of Kings River, tributary to Kings River, to be diverted in Section 6, T 11 S, R 28 E, M.D.M., for generation of hydro-electric energy in NW ¼ of Section 6, T 11 S, R 28 E, M.D.M., 6250 T.H.P. to be developed.

Application No. 4649 (Fresno County)—San Joaquin Light & Power Co., Fresno, California, for 220 cubic feet per second from North Fork of Kings River, tributary to Kings River, to be diverted in Section 3, T 12 S, R 27 E, M.D.M., for generation of hydro-electric energy in NE ¼ of Section 12, T 12 S, R 26 E, M.D.M., 61,875 T.H.P. to be developed. Estimated cost, $10,222,179.00.

Application No. 4650 (Fresno County)—San Joaquin Light & Power Co., Fresno, California, for 220 cubic feet per second from North Fork of Kings River, tributary to Kings River, to be diverted in Section 1, T 11 S, R 27 E, M.D.M., for generation of hydro-electric energy in SE ¼ of Section 34, T 11 S, R 27 E, M.D.M. 53,000 T.H.P. to be developed. Estimated cost, $9,571,840.00.

Application No. 4651 (Fresno County)—San Joaquin Light & Power Co., Fresno, California, for 220 cubic feet per second from North Fork of Kings River, tributary to Kings River, to be diverted in Section 10, T 12 S, R 26 E, M.D.M. Generation of hydro-electric energy in NW ¼ of Section 19, T 12 S, R 26 E, M.D.M. 10,500 T.H.P. to be developed.

Application No. 4662 (San Joaquin County)—Mrs. Susie Moran, c/o Ohm & Raab, 517 East Market Street, Stockton, California, for 1.24 cubic feet per second from Grant Line Canal, tributary to San Joaquin River, to be diverted in Section 26, T 1 S, R 4 E, M.D.M., to be used for agricultural purposes on 99.2 acres in Sections 23 and 26, T 1 S, R 4 E, M.D.M. Estimated cost, $1,500.00.

Application No. 4665 (Butte County)—Gorrill & Hotchkiss, 1050 Esplanade, Chico, California, for 15 cubic feet per second from Butte Creek, tributary to Sacramento River, to be diverted in Section 7, T 20 N, R 2 E, M.D.M., for irrigation of rice, 1200 acres in Sections 7, 8, 17, 19, 20, 29 and 30, T 20 N, R 2 E, M.D.M. Estimated cost, $1,500.00.

OREGON

The following list includes the more important applications as filed in the office of Rhea Luper, State Engineer, of Oregon, for the last month for which records are available:

M. J. Lee, Trustee, of Canby, covering the appropriation of water from Molalla River, and two unnamed streams tributary thereto, and Pudding River for irrigation of approximately 3,000 acres and development of power in Clackamas County.

E. H. Hinton of Lewis, covering the appropriation of water from Chesninimus Creek for irrigation of 11 acres in Wallowa County, at a cost of $500.

City of Astoria covering the appropriation of water from Youngs River for development of 200 theoretical horsepower, and for a municipal supply for the city, in Clatsop County, at an estimated cost of $200,000.

Harry Sordy of Merlin, covering the appropriation of water from Rich Gulch for development of 5 theoretical horsepower for mining in Josephine County, at a cost of $1,000.

John Allstead, A. C. Brown, and H. C. Foster of Halfway, covering the appropriation of water from Pine Creek for irrigation of 40 acres in Baker County, at a cost of $200.

City of Clatskanie, covering the appropriation of water from Conyers Creek for municipal purposes for the city, at a cost of $20,000, in Columbia County.

F. F. McCready of Chiloquin, covering the appropriation of water from Sprague River for irrigation of 218 acres in Klamath County, at a cost of $2,000, and also covering the appropriation of unknown flood wash for irrigation of 60 acres in Klamath County, at a cost of $400.

Baar & Cunningham of Portland, covering the appropriation of water from Calapooia Creek for domestic purposes in Douglas County, at an estimated cost of $60,000.

Wilson R. Winans of Hood River, covering the appropriation of water from Inlet Creek for irrigation of 30 acres, development of 15 theoretical horsepower, and for domestic purposes in Hood River County.

Howard Evans of Freewater, covering the appropriation of water from Eagle Creek for development of power in Baker County.

Ralph H. Springsteen of Ashland, covering the appropriation of water from Keene Creek for irrigation purposes in Jackson County.

Geo. W. Stewart of The Dalles, covering the appropriation of water near bank of Chenowith Creek for irrigation of 1 acre, domestic and stock purposes in Wasco County, at a cost of $500.

E. E. Billings of Marial, covering the appropriation of water from Rocky Bar Creek for irrigation of 6½ acres in Curry County at a cost of $500.

Davis & Fretwell of Leland, covering the appropriation of water from Butte Creek Fork for mining purposes in Josephine County, at a cost of $1,000.

Power Developments

Eleven applications for permit or license under the Federal water power act were filed with the Federal Power Commission during the seven weeks' period ended July 11, 1925, making a total of 625 applications received to that date. The following are the applications received from west of the Mississippi River:

No. 614—The Southern California Edison Company has applied for a license for a transmission line in Ventura County, California, a small portion of which is on Government lands.

No. 615—Walter G. Muncy has applied for a license for a small power development for domestic and camp use in Kelly's Gulch, about 19 miles from Crescent City, Del Norte County, California.

No. 616—The Great Western Power Company has applied for a license to increase by 45 feet the height of an existing dam in the North Fork of Feather River, near Greenville Plumas County, California. This will add one milion acre feet to the storage capacity from Lake Almanor and will regulate the flow of water in the river now used through the Company's existing Caribou and Big Bend power plants.

No. 619—The Feather River Power Company has applied for a license to construct a 106-foot dam on Bucks, Grizzly, and Milk Ranch Creeks, in Plumas County, California. A reservoir with a capacity of 103,000 acre feet will be created and the project will have an approximate primary capacity of 60,000 horsepower, intended for general sale.

No. 621—The Inland Power & Light Company has applied for a preliminary permit covering the construction of a power project in Clearwater River, about two miles above

Lewiston, Nez Perce County, Idaho. The power to be developed will be for general sale.

No. 622—The Ventura Power Company has applied for a preliminery permit for a power installation consisting of two reservoirs and three power units, with appurtenant structures, in Sespe Creek, Ventura County, California. The dams will be 200 and 240 feet high and will impound 63,500 and 10,800 acre feet of water, respectively. The developed power will be used for general sale.

No. 623—The Ventura Power Company has applied for a preliminary permit for a power installation with a primary capacity of approximately 25,000 horse-power, in Ventura and Los Angeles Counties, California. The project will comprise a reservoir of 22,000 acre feet capacity behind a 200-foot multiple-arch type dam at the junction of Bucks and Piru Creeks, and another reservoir on the latter creek near Los Alamos Creek with a capacity of 53,000 acre feet behind a 210-foot dam, tigether with three power houses and other appurtenant works. The power to be developed will be for general sale.

No. 624—The Southern Sierras Power Company has applied for a license for a short transmission line near Wilde, Victorville and Oro Grande, San Bernardino County, California.

No. 625—The Jo Reynolds Mining, Milling, Drainage, Tunnel and Transportation Company has applied for a license for its constructed power project in Clear Creek County, Colorado. The primary capacity of the plant is about 112 horsepower, used for mining operations.

New Incorporations

The following new water companies have been incorporated in California during the last month for which official records are available:

No. 114448—SOUTH VALLEY MUTUAL WATER CO. (a California company). Directors: Chas. Goodhue, Josiah Main, Geoffrey Fricker, Chas. Ott, and L. T. Schwacofer, all of Hemet, Cal., (each one share). Date of filing, June 4, 1925. Place of business, Hemet, Riverside County. Capital stock, $25,000. Par value, $100. Amount subscribed, $500. Purposes—To furnish water to its stockholders at cost for domestic and irrigation only on the following land: west ¾ of section 18 and 19, township 5 south range one east S. B., B & M. and sec. 13, 14, 23 & 24 of township 5 south range one west S. B. B. and M. Articles filed by Bruce W. McDaniel Legal Dept., Mutual Orange Distributors, Redlands.

No. 114477—LA CUMBRA ESTATES MUTUAL WATER CO. (a California company). Directors: Homer D. Crotty, Ira C. Powers, Malcolm Davis, all of Los Angeles; Geo. Arblaster, South Pasadena; J. C. Macfarland, South Pasadena, (each one share). Date of filing, June 6th, 1925. Place of business, Los Angeles. Capital stock, $205,000. Par value, $100. Amount subscribed, $500. Purposes—to supply water to stockholders only for domestic and irrigation. Articles filed by Gibson, Dunn & Crutcher, 1111 Merchants National Bank Building, Los Angeles.

No. 114487—PASADENA TERRACE MUTUAL WATER CO. (a California company). Directors: Warren H. Kerr, Los Angeles; E. S. Patterson, Glendale; Noren Eaton, Whittier, (each one share). Date of filing, June 8, 1925. Place of business, Los Angeles. Capital stock, $10,000. Par value, $50. Amount subscribed, $150. Purposes—to supply water for domestic purposes to its stockholders on tract of land known as Tract 7446, County of Los Angeles as per map record in Book 47, pages 21 and 22 of Maps of County Recorder's office, Los Angeles. Articles filed by Moote & Patterson, 830 H. W. Hellman Building, Los Angeles.

No. 114644—FAWNSKIN WATER COMPANY, (a California company). Directors: J. S. Waybright, Howard C. Thompson, and F. R. McArthur, all of Los Angeles, (each one share). Date of filing, June 18, 1925. Place of business, Los Angeles. Capital stock, $75,000. Par value, $10. Amount subscribed, $30. Purposes—to sink and maintain wells and supply water to municipal and private corporations and individuals for domestic and irrigation use. Articles filed by Theodore Stensland, 226 Black Building, Los Angeles.

No. 114740—TOPANGA OAKS MUTUAL WATER CO., (a California company). Directors: Walter H. Prier, Bundy Drive and Gorham Ave., west Los Angeles; Mor M. Fogel, 507 Palisades Ave., Santa Monica; Ralph C. McCague, 1337 Third St., Santa Monica, (each one share). Date of filing, June 27, 1925. Place of business, Santa Monica. Capital stock, $1500. Par value, $1. Amount subscribed, $3. Purposes—to furnish water for domestic purposes to owners of land in tract No. 6943, County of Los Angeles. Articles filed by Fogel & Beman, Santa Monica.

No. 114805—MERIDIAN MUTUAL WATER CO., (a California company). Directors: C. C. Nordal, R. L. Farnsworth, E. O. Eggen, G. P. Hill, R. W. Anderson, all of Hemet, (each one share). Date of filing, July 2, 1925. Place of business, Hemet. Capital stock, $10,000. Par value, $10. Amount subscribed, $50. Purposes to operate wells and pumping plant and distribute water to its stockholders.

No. 114870—WEST GATEWAY MUTUAL WATER CO., (a California company). Directors: Gordon Edward, R F D, Box No. 3; Wilson E. Profitt, Ralph C. Milner, R. B. Smith, all of R F D, Box No. 3, Whittier; A. A. O'Quinn, Montebello, (each one share). Date of filing, July 8, 1925. Place of business, Los Angeles. Capital stock, $5,000. Amount subscribed, $25. Par value, $5. Purposes to furnish water for domestic purposes only to its stockholders and to the owners of lots constituting and comprising Tracts 6614 and 6767, Los Angeles. Articles filed by D. M. Potter, 511 Chapman Bldg., Los Angeles.

Survey Uinta Basin

To provide a means of estimating the possible extent of development of resources of the Uinta Basin, Utah, which are dependent on water supply, and of planning the best methods of development, an investigation has been made by the Department of the Interior, and a report of this investigation entitled "Water supply of Uinta Basin and its utilization," has been prepared by Ralf R. Woolley, hydraulic engineer of the Geological Survey, and the late C. C. Jacob, for several years water master in the Uinta Basin.

This report considers the present utilization of the water supply of the basin for both irrigation and power and proposes plans for the future utilization for both purposes.

AMONG OUR CONTRIBUTORS

Some Editorial Jottings About Current and Forthcoming Feature Articles Dealing With Practical Problems of Irrigation, and the Men Who Have Written Them

AS ASSOCIATE irrigation engineer, in charge of the Los Angeles office of the Division of Agricultural Engineering, U. S. Department of Agriculture, Harry F. Blaney is well qualified to write on the cost of water to farmers under California irrigation enterprises. Mr. Blaney has been identified with this branch of the government, which is devoted to irrigation research and investigations, since 1917.

During this time most of his work has been done in co-operation with the State of California, with the exception of one year, spent in Utah and Colorado. He is the author of Bulletin No 8, recently issued by the California Department of Public Works, Division of Engineering and Irrigation, under the title, "Cost of Water to Irrigators in California," and his article in this issue, written especially for MODERN IRRIGATION, is based upon the investigations of which this bulletin was a summary.

Mr. Blaney was born in Los Angeles in 1892, and was graduated in Civil and Irrigation Engineeering in 1915 from the University of California. He is an associate member of the American Society of Civil Engineers.

ON THIS page last month it was promised that C. A. Utley's discussion of the facilities for display afforded irrigation equipment manufacturers at the California State Fair would be an intriguing story—and it is. Mr. Utley is field engineer for the Pelton Water Wheel Company, having held this position for the past eight years; and is Secretary of the Western Irrigation Equipment Association. His interest in obtaining a better display of irrigation equipment is, of course, primarily taken from the standpoint of the manufacturer; but in his story of John Baxter's search for the "Machinery Building," he was wisely treated the problem from the standpoint of the potential buyer, who goes to the fair, not for its horse-racing or catch-penny amusements, but for the practical purpose of seeing an exposition of the most advanced equipment.

Mr. Utley is a certified member of the American Association of Engineers, and a member of the California Committee on the Relation of Electricity to Agriculture.

FRANCIS CUTTLE, who writes for MODERN IRRIGATION on the meaning of conservation, is a pioneer conservationist of the west. Since 1909 he has been president of the Water Conservation Association of Southern California; and since 1907 has been chairman of the Tri-Counties Reforestation Committee. He was instrumental in forming both of these organizations, and has served as their executive head as long as they have been in existence. He was for five years a member of the California Conservation Commission, and is now a member of the State Board of Forestry of that State.

He is a member of the Board of Editorial Advisors of MODERN IRRIGATION, and in the July number of the magazine was introduced to our readers in more detail.

THE SECOND instalment of B. J. Seger's article on "Adequate Farm Loans for Irrigated Lands" appears in our department devoted to Irrigation Finance. Mr. Seger has lived through the problems with which he deals in this article. In addition to his work in constant touch with the financial affairs of the North Platte Valley Water Users' Association and the Farmers' Irrigation District, of which he is Secretary and Treasurer, he has a broad acquaintance with the financial problems of irrigation projects throughout Nebraska and other parts of the country. As a member of the legislative committee of the State Irrigation Association he has assisted in securing the enactment of laws which make possible such solutions of these problems as he advises in this article.

BRAINERD B. SMITH, author of the article on Page 14, in which he tells of plans to reclaim desert lands by pump irrigation under government supervision, is the officer in charge of the United States Land Office at Los Angeles.

Prior to July 1, 1925, Mr. Smith was Register of the Land Office, but a reorganization of the California offices as of that date has consolidated the Los Angeles and El Centro branches and combined the duties of the Receiver and Register under one head.

Mr. Smith is another "native son" of California, and has made his home in Pasadena for the past twenty years. For more than twenty years he has been an engineer, following Mining and Civil Engineering as a profession. He was appointed to his present post by former President Harding, and reappointed by President Coolidge.

ARNOLD P. YERKES, author of our article on the use of tractors on irrigated farms, is connected with the International Harvester Company, Chicago, and has his headquarters in that city. He is editor of "Tractor Farming," a publication put out by his company, and is known as a specialist on farm implements. A paper read by Mr. Yerkes on a phase of this subject was a feature of the recent national convention of the American Society of Agricultural Engineers.

PROFESSOR BECKETT, whose paper, entitled "Some Agricultural Engineering Problems of Irrigated Agriculture," delivered at the recent convention of the American Society of Agricultural Engineers, is published in this issue, is a native Californian and a graduate of the University of California with a B. S. degree from the College of Civil Engineering. He began his career, as so many men who have become well known in the irrigation world have begun theirs, with the U. S. Reclamation Service, as a transit-man and assistant engineer. From 1909 to 1912 he was identified with the Department of Agriculture, and in the latter year became connected with the University of California where he is now Associate Professor of Irrigation Investigations and Practice.

DAVID WEEKS, author of the "lead feature" of the Reclamation Department, is engaged in agricultural economic research for the Department of Agriculture, University of California, and is also Consulting Engineer for the United States Bureau of Reclamation. Prof. Weeks is chairman of the committee appointed by the Department of the Interior to investigate the economic feasibility of the Spanish Springs Reclamation Project, Nevada, which came into the limelight in the last session of Congress. He was formerly in charge of Drainage and Irrigation instruction at Iowa State College, and has been engaged in general Consulting Engineering practice. On different occassions Prof. Weeks has served as Vice-President on the National Council of the American Society of Agricultural Engineers. He organized the Reclamation Division of the American Society of Agrictural Engineers and served as its first chairman. His article on the application of economic principles to the National Reclamation pclicy is a part of a paper recently presented before the Pacific Coast section of the A. S. A E.

DURING the next few months MODERN IRRIGATION will contain many valuable technical contributions from outstanding experts in western irrigation. One of the men who is preparing a helpful feature to appear in our columns, in an early issue, is A. M. Barton, chief engineer of the State Reclamation Board of California. Another well-known contributor who has promised to have a feature for the magazine very soon is D. W. Murphy. Mr. Murphy's special activity has been in the reclamation of irrigated lands that have "gone alkali." He has been in charge of this work for the Imperial Irrigation District in a consulting capacity and has directed the reclamation of a very large acreage of alkaline and water-logged lands.

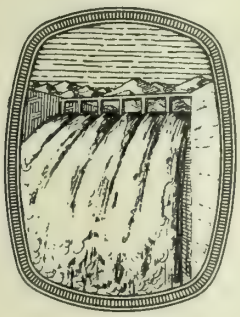
PETROLEUM WORLD 626 S. SPRING ST., LOS ANGELES, CALIF. MODERN IRRIGATION

GEORGE W. P. HUNT

Governor of the State of Arizona, and storm center around whom the controversy over Arizona's attitude toward the "Colorado River Compact" rages with redoubled fury as the result of the abortive conference of the California, Arizona and Nevada delegates during August. Governor Hunt began his Arizona career as a ranchman on the Salt River, from 1881 to 1891, and has been a figure in the political life of the state since 1893. Two articles in this issue are devoted to the Phoenix conference.

MODERN Irrigation
The Magazine of Applied Hydraulics



Volume 1 SEPTEMBER, 1925 Number 3

The Progress *of* Irrigation

ARIZONA'S governor, Hon. George W. P. Hunt, addressing delegates from Nevada and California and his own committee, representing Arizona, who had gathered at Phoenix on August 17th to discuss the problems of the development of the Colorado River, set forth the theory that the river is a resource of the people of Arizona, and that her sister states who may be desirous of the immediate development of that resource ought, in fairness, to make satisfactory offers of compensation.

Arizona, declared Governor Hunt, in effect, is not seeking any development of the Colorado at this time; her attitude is passive; and her only concern is to see that her rights are protected against encroachment.

The storm which this pronouncement precipitated, in the midst of which the conference adjourned abruptly and without the slightest accomplishment, centers around the stalwart head of the governor. Unfortunately there has been, in the first reaction to his remarks, too much of a matter of personalities involved to reflect much light upon the major issues involved.

GOVERNOR Hunt is supported by a strong faction who see in him the hope of protecting the greatest resource of a state to which Nature has been, in truth, not too generous. But his attitude does not reflect the unanimous sentiment of Arizona; he is opposed by many who accuse him of supporting a vacillating policy dictated by political expediency and selfish interests. And from outside of his own state still more recrimination is heaped upon him by those who see, in his insistence that Arizona is satisfied with the *status quo* on the Colorado, a manifestation of the attitude which made famous the dog in the manger.

The Colorado River is bigger than any individual, and it ought not to be discussed on the basis of personalities. Whether Governor Hunt's remarks at the Tri-State Conference were the expression of his own deep and conscientious conviction—as must be assumed—or whether they may have been in part inspired by a desire to further his political fortunes in Arizona, as some have declared, there is no doubt about the philosophy which he expressed. As plainly as words could say it, he declared that the Colorado River is a possession which

Arizona is not disposed to share without a sufficient *quid pro quo*. If that philosophy is an unreasonable one, it must be shown to be such.

The people of Arizona, or any large percentage of them, are not to be blamed if they are reluctant to hand over the water resources which are so important to the state's development. The whole matter of the Colorado River, however, is so complexly affected by engineering, financial and—above all—by political factors, and there is so little agreement on any one of these phases of the main issue, that it is no wonder the lay observer is bewildered and unwilling to accept any man's word as final. In such a situation the political philosophy of Governor Hunt might, indeed, have been shrewdly calculated to appeal to the average citizen. Not able to judge for himself of engineering feasibility, nor to identify clearly the political interests involved, he is more willing to let matters rest as they are than to commit himself to any definite course of development.

NEVERTHELESS, the welfare of the Southwest as a whole is demanding the development of the Colorado. Those who champion such development believe that the interests of Arizona are closely and vitally identified with those of her sister states in requiring its development at the earliest possible date. It is for them to demonstrate this to the legislature and the people of Arizona. Governor Hunt is not an hereditary monarch. If his policies are proved to be wrong, to the satisfaction of the people of Arizona, he will very soon be removed from the scheme of things. Until the people of Arizona are convinced that their *own interest* lies in sharing the Colorado River with California and Nevada, as well as with the upper basin states, they are doing only the natural thing to insist upon making haste slowly.

ANOTHER focus of controversy now attracting attention, into which it is difficult for outsiders to see clearly, is the Imperial Irrigation District in California, which is suffering the pains of reorganization, complicated by a light and heavy artillery fire upon the directors of the district, by those who believe that they have gone beyond their rightful powers in their desire to aid the Swing-Johnson bill.

In response to an invitation from MODERN IRRIGATION, the president of the Imperial Irrigation District tells, in this issue, what the directors of the district are attempting to accomplish. Mr. Pound's explanation of the directors' policy of reorganization gives an illuminating glimpse of some of the vicissitudes faced by irrigation administrators.

IN THE "unfavorable" report submitted to Secretary Work by the special commission which investigated the Columbia River Basin irrigation project, there is something of encouragement for those who are banking on the great future of the West. The report finds that the project is technically feasible; but it advises against the Bureau of Reclamation assuming responsibility for it, on the ground that the proper time has not yet come, and the experience of the Bureau has not been sufficient to justify the assumption of so complex and immense a task.

Thus, even while those who are most anxious for the project's development are temporarily discouraged, they are, at the same time, vindicated in their beliefs. The Columbia River Basin project is pronounced feasible. It is a matter of time only until their prophetic visions of its transforming potentialities will be demonstrated.

TEXAS, Oklahoma and New Mexico have large plans on foot for developments which will serve the three related purposes of flood control, power generation and reclamation by irrigation. Irrigation commissioners from these three states, and many interested engineers, were in conference in August at Amarillo, Texas, and later at Tucumcari, New Mexico.

A dam to be erected on the Canadian River near Logan, New Mexico, forms the principal link in the chain of projects which this conference has envisioned for development in these states. In magnitude the dam, as contemplated, would represent the largest irrigation project in the world. It would form a water storage reservoir sufficient to irrigate from three to four million acres of arid land in two states.

These plans are not mere creations of the too hopeful imagination. Surveys of the North and South Canadian Rivers, the Cimarron River and the Red River have been made under authorization of Congress, which appropriated $1,500,000 for the purpose. The projects under consideration are too big to be worked out in a short time—enterprises of such magnitude require years—but they, or other similar developments, will eventually come to pass. Every state in the West, from Texas to Washington, faces activity in irrigation within the next twenty years beside which the past two decades may scarcely be compared.

Arizona is Center of Great Construction Activity

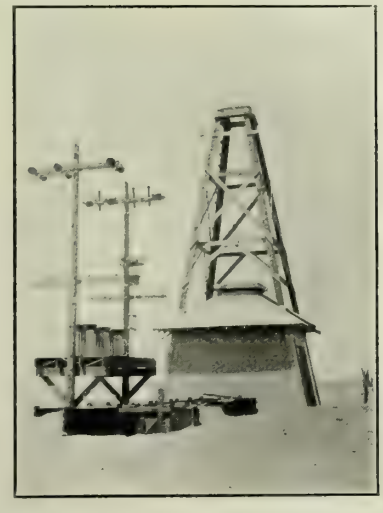
Roosevelt Conservation District's Developments Described in Detail

Grader on the Main Canal of the Roosevelt Water Conservation District's 41,500-Acre Project

By H. I. WOOD
Construction Engineer

THE ROOSEVELT Water Conservation District of Arizona recently completed the construction of the major portion of its 41,500-acre project adjacent to and east of the Salt River project.

One of the most successful irrigation projects in the west is the Salt River Valley project, receiving its water from the great Roosevelt Reservoir on the Salt River in Arizona. About 240,000 acres are irrigated under the project and the prosperity of this section of Arizona is well recognized. The Roosevelt Water Conservation District is another one of the projects in the same valley which is being put under irrigation with its main source of water supply from the Roosevelt Reservoir.



TYPICAL OF THE STRUCTURES SERVING ROOSEVELT PROJECT

The Roosevelt Water Conservation District, with headquarters at Mesa, Arizona, contains 41,500 acres, is curved in form toward the eastern side and parallel to the rising rim of the Salt River Valley. It is about 18 miles in length and about 3.5 miles in width. The eastern boundary of the District is formed by the main canal of the project and the western boundary by the eastern canals of the Salt River Valley project.

IT SELDOM occurs that the interests of two irrigation projects are so mutually and advantageously related as are those of the Salt River project and the Roosevelt Water Conservation District. More than half of the District's water supply will be obtained by lining of 34 miles of the canals of the Salt River Valley Water Users' Association, the operating organization of the Salt River project. The cost will be paid by the District. This conserved water, in some sections to be lined, is as much as ten per cent of the flow. A contract between the Association and the District stipulates the amounts of conserved water in percentages of the flow in the lined canals and carries also the right of regulation in the Roosevelt Reservoir when space is available.

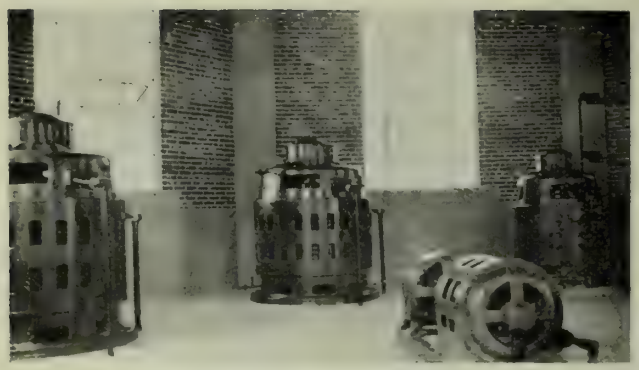
The water conserved by canal lining, amounting normally to about 60 per cent of the requirements of the District, and the flood water of the Verde River, are diverted at the Granite Reef Dam on the Salt River, about six miles east of the District's main pumping plant. The balance of the water is obtained by pumping from wells in the southern end of the District. The water requirements have been based upon an average application at the fields of 3.2 feet of water per annum on 90 per cent of the total area of the District. The average transit losses are taken at 10 per cent because the main canal will ultimately be lined and the laterals are relatively short; averaging somewhat less than three miles.

The main pumping plant has a capacity, in the four units now installed, of 200 second feet and lifts the water 52 feet into the head of the main canal. It has two 30-inch and two 20-inch wet pit type Byron-Jackson vertical, centrifugal pumps driven by two 600 H. P. and two 200 H. P. vertical, synchronous, General Electric motors. The four units as now installed discharge through one 66-inch diameter concrete pipe line. Provision has been made in the building and arrangement of the plant for the additional installation of two 30-inch pumps and two 600 H. P. motors. When these are installed and a second 66-inch pipe is built, the capacity of the plant will be 350 second-feet. The discharge of the pumps is controlled by hydraulically operated gate valves which are closed automatically by magnet operated valves in case of failure of power. An automatic Kewanee pressure system with a pressure tank supplies the pressure for operating the hydraulic valves.

The discharge pipe line is equipped with a Builders Iron Foundry Company's venturi meter and recorder. The building is octagonal in plan, and of reinforced concrete. The sump below the motor floor, in which the pumps are located, is divided into two compartments by a center division wall. This wall supports the floor beams at the center line of the building. A trash rack made up in removable panels and supported vertically in vertical I-beams is set radially around the front of the building. By removing the trash rack panels and substituting flashboards in the grooves, either half of the sump can be isolated from the forebay and unwatered, permitting inspection or repairs of the pumps or valves. The forebay is designed with considerable width and the velocity of approach will be lower than the flow of the Association's canal, from which the water is diverted and it is anticipated that very little trash will reach the plant.

WALLS of the motor room have brick panels, steel sash and ribbed glass windows. The roof is supported by heavy steel trusses and covered with Mission tiles. An outdoor type substation, consisting of four 833 KVA Westinghouse transformers with lightning arresters and oil circuit breaker, has been constructed adjacent to the pumping plant to transform the incoming electric energy from 44,000 volts to 2,200 volts. The pumping plant and substation cost $103,000.

The main canal along the eastern boundary of the project is 21 miles long



Interior View of the Main Pumping Plant, Which Has Two 30-inch and Two 20-inch Wet Pit Type Byron-Jackson Vertical Centrifugal Pumps

and has a maximum bottom width at the upper end of 16 feet and side slopes of 1 on 1. It has a capacity, unlined, of 200 second feet, which is just equal to the capacity of the pumping plant as now completed. The capacity when lined will be 350 second feet. The main canal crosses under the Apache Trail Highway through a reinforced concrete box type culvert. A similar type crossing was constructed under the Arizona Eastern Railroad. There are 14 county road timber bridges with concrete abutments across the main canal. Fourteen reinforced concrete checks are also provided on the main canal. The checks have hand wheel operated, steel gates. They vary in size according to the canal capacity, the larger checks having four 48x48-inch gates and the smaller having two gates 30x42-inch. Thirty-five delivery gates from the main canal were provided, consisting of 24-inch or 30-inch diameter concrete precast pipe 20 feet in length provided with concrete headwalls and wings and Calco Model No. 101 gates.

EXCAVATION on the main canal was done mainly with a New Era elevating grader operated by a Best tractor. Two P. & H. three-quarter yard draglines were used, one on the first 3,100 feet of the canal where hard caliche was encountered and the other at the lower and smaller sections of the canal. A total of 201,000 cubic yards was excavated on the main canal in five months. The same two draglines also excavated 97 miles of laterals.

The laterals in general follow the section lines with deliveries to the high point of each quarter section of land. The laterals were constructed with 1 to 1 side slopes and 3-foot bottom and averaged about .4 cubic yards per foot. Seventeen miles were built with stock and 97 miles with the two drag lines which also worked on the main canal. The lateral work, including 3.5 miles of 8-foot bottom and 2 miles of 6-foot bottom main lateral, forming the Eastern canal extension, involved, in all, 227,000 cubic yards.

The lateral structures included six timber bridges, four concrete checks, two timber flumes, two 18-inch concrete siphons, nine cast iron delivery gates with concrete pipe and wings, similar to those on the main canal, 204 redwood turnouts, 60 redwood drops, eighty-six corrugated Amsco pipe culverts 24 inches by 20 feet, and twenty-eight corrugated Amsco pipe culverts 30 inches by 20 feet, for county road crossings.

TWELVE old wells were taken over and twelve new 20-inch wells were drilled to an average depth of 308 feet. These twenty-four wells have been equipped with Byron-Jackson deep well pumps. Most of the old wells had 16-inch casings and in these were installed No. 3 screw pumps with 10-inch diameter columns. The other wells were equipped with No. 6 turbines with 12-inch columns. The average designed lift is 91 feet. The discharge will average about 75 second feet from all the wells. The lower lift pumps have 60 H. P. motors and the others have 75 H. P. motors. The pump heads are the Byron-Jackson built-in type which are all the same size and have the thrust bearing on top of the motor. The motor part is 440-volt General Electric Company's make.

The principal advantages of this type head are its rigid construction which makes it free from vibration and the ease of making adjustment of the impeller clearances. The motors are equipped with 440-volt 75-H. P. automatic starting compensators and time delay relays set for sequence starting. A switchboard in each plant mounts the ammeter, watthour meter, manual control switch, ammeter shunt switch and the time delay relay. The power is distributed at 11,000 volts and is transformed at each well by an outdoor pole type sub-station, equipped with Kellman oil circuit breaker, choke coils, lightning arrestors and three 25 KVA Westinghouse oil immersed transformers. The pump equipment is housed in a wooden building built at the base of the towers.

THIRTY miles of 11,000 volt transmission line was constructed to serve the wells. An outdoor type sub-station was constructed near Chandler consisting of four 833 KVA., 44,000—11,000 volt Westinghouse transformers and lightning arresters and General Electric Company oil circuit breaker. Eight miles of this line was constructed jointly with the Queen Creek Irrigation District, i. e., two separate power lines were erected on one set of poles.

The lining with concrete or asphalt or both, of the Association's canals will be undertaken during October, November and December of this year when the flow in the canals can be interrupted. This work involves the lining of 34 miles of the Salt River Valley Water Users' Association's canals, beginning at Granite Reef Dam. The expense of this lining will be paid to the Association by the District and involves about eight million square feet which has been estimated at $835,000.00.

The lining of the District's own main canal will be done under the second period of construction and only after more than 60 per cent of the land is under irrigation. This will require about three million square feet of lining. This work and the addition of two 30-inch pumps and motors and the second pipe line at the main pumping plant will complete the District's project.

The advantage of keeping the investment in construction as nearly as possible parallel with the development of the project has still further been carried out in a power contract between the Association and the District. The contract provides that the District may purchase power at actual production cost

What the Board of Directors of the Imperial Irrigation District is Trying to Do

By EARL C. POUND

President, Imperial Irrigation District

ANY DISCUSSION of the reorganization program now being pursued by the Board of Directors of the Imperial District must of necessity include a brief statement of the conditions existing in the district.

It is doubtful if there is any irrigation district in the United States that has occupied the attention of the public eye as long or as consistently as has the Imperial Irrigation District. Almost every action taken by this Board has had an attendant flood of approval or criticism, not only from those who live in the Imperial Valley, but from Los Angeles, Sacramento, and even from the government departments in Washington, D. C.

For that reason, the Board of Directors is constrained to move slowly and only after careful deliberation, even in matters that would ordinarily attract no particular comment.

WITH this general situation in mind, it is possible to go into the detail of the economy program now in process of being worked out by the Board. The program is not in itself unusual, nor is it one that calls for the exercise of extraordinary powers in a District Board. Probably in no other irrigation district in California would such a move attract outside attention. It is true that the elimination of certain department heads has been necessary and that combination of certain offices, requiring dismissal of the men in charge, has been effected. But that phase of the program is purely incidental and in no way to be considered significant of schemes having an ulterior motive. The whole thing is simply a matter (one of many) of routine in the duties that fall to the Board of Directors of any irrigation district.

AS A MATTER of fact, what is actually taking place under the action of the Directors is a cutting away of every unnecessary item of expense in the operation of the irrigation system, a centralization of responsibility and a corresponding increase in efficiency.

To effect such saving to the people, the Directors have taken inventory of the District. They have found that the office of Chief Engineer is one that is essentially obsolete from point of need in the maintenance of the District. There are no large engineering works to be built at present. Rather than an engineer, it is found that the system requires an executive to superintend and be responsible for efficient maintenance of the system that has been built. Therefore the Board has dispensed with its Chief Engineer and in his place hired a general superintendent. That the general superintendent must be an engineer as well as a business executive is accepted, and the position has been filled with that qualification in mind.

The inventory revealed the fact that the District shops were not being operated so as to give the maximum service to the system. It was accordingly the duty of the Board to make them more efficient. In doing that it was seen that removal of them and the general offices from Calexico, on the extreme south border of the District, to Imperial, in the center of the District, would save hundreds of thousand of dollars to the people. The move was accordingly ordered by the Board, and that it was justifiable is shown by savings already actually made. Certain interests saw fit to attribute political significance to the removal procedures, but their injunctions were denied by the court and the action of the Board approved in a clear-cut decision handed down by a judge brought in from the northern part of California to hear the case.

A PARAGRAPH from the report of the master-mechanic in charge of the new shops at Imperial will indicate some of the results of the action by the Board:

"On April 1, 1925, when I assumed charge of the Imperial shops, I was assured by the shop foreman that accumulated unfinished work would require at least three months to complete even if no additional work came in. There were 69 men on the payroll then. It is my pleasure to report that within one month all accumulated work was finished

GLENN D. SMITH

GEORGE L. SWENDSEN

WILLIAM DURBROW

Comprising the Present Membership of the "Irrigationist" Group of MODERN IRRIGATION'S *Board of Editorial Advisors*

Three Prominent *"Irrigationists"* Are Counsellors to *Modern Irrigation*

WEBSTER defines an irrigationist as "one who is interested in, or who carries on, or favors, irrigation," while an irrigator is, of course, "one who irrigates."

This distinction is the fundamental one recognized by MODERN IRRIGATION in the creation of a group of members on its Board of Editorial Advisors representing "irrigationists," but there is something more implicit in the word than suggested in the dictionary definition.

The farmer who supplements rainfall artificially is an irrigator, no matter how small or how large his activities, as such; but to be an irrigationist his interest in irrigation must extend beyond the confines of his own acres, his own furrows and standpipes, and he must envision irrigation as a broader, bigger thing than an incident to his own livelihood.

Those men are irrigationists, in the larger sense, whose skill and activity are dedicated to the promotion of sound irrigating methods, embracing a knowledge of the problems of water from the time it is precipitated from the clouds to its transpiration back into the air.

The president of the California Mutual Water Companies Association; the president of the Irrigation Districts Association of California, and an active managerial and engineering executive, recognized as one of the leaders of the western industry, are the three men selected from California as representative of irrigationists, who comprise this group of MODERN IRRIGATION'S Board of Editorial Advisors.

WILLIAM DURBROW, president of the Irrigation Districts Association of California, was graduated from the University of California in Engineering, with the class of 1899. After spending a few years in mining and smelting work, including an extensive trip to the West Coast of South America, in 1903, he became engineer and manager of water and power properties in Butte County, California, which later became known as the Oro Electric Corporation.

About this time, Mr. Durbrow became interested as a land owner on the West Side of the Sacramento Valley where his interests have mainly been ever since.

During the World War he served his community as Food Administrator of Glenn County.

In 1919 he became one of the leading organizers of the Glenn-Colusa Irrigation District, the largest irrigation district in the northern part of California. After the organization of this district Mr. Durbrow became president of the district and remained so until he resigned to become the secretary and manager of the same district.

In 1923 he was chosen president of the Irrigation Districts Association of California, and was re-elected to this office in 1925.

In 1924 he was appointed a member of the Permanent Committee of the Sacramento-San Joaquin River Problems Conference, and has taken a prominent part in the working out of the water difficulties along the Sacramento River.

In 1925 Mr. Durbrow was elected Trustee and President of Reclamation District 2047, a district containing a quarter of a million acres, organized for the draining of the West Side lands of the Sacramento Valley.

By virtue of his prominence in irrigation affairs he has repeatedly served on various committees having to do with the development of the water resources of the West.

GLENN D. SMITH, president of the California Mutual Water Companies' Association, is vice president and general manager of the San Antonio Water Company and of the Ontario Power Company, of Ontario, California. Mr. Smith came to the west from Michigan in 1907, leaving an executive

GOVERNMENT ENGINEERS TAKING SOUNDINGS AT THE BOULDER CANYON DAM SITE. THIS IS THE SITE THAT NEVADA FAVORS AND GOVERNOR HUNT OPPOSES

Tri-State River Conference Adjourns in Disagreement

Governor Hunt's Statement Made Discussion Futile, Visiting Delegations Declared

L'ETAT C'EST MOI, (*I am the State*) declared Louis XIV of France. Something of the same imperial attitude is read by many observers into the statement of Governor Hunt of Arizona before the Tri-State Conference on the Colorado River, the reception of which led to the adjournment of that body without accomplishment.

Friendly partisans, on the other hand, see in Governor Hunt's speech, in which he stated his position and impliedly the position of the delegation representing Arizona, merely a laudable determination to protect the political and economic rights of the state against would-be encroachers.

Convening in the senate house at the Arizona capital—Phoenix—on August 17, the conference had time only to receive Governor Hunt's message, to deliberate briefly upon its implications, and to declare that it precipitated a situation which made futher conference impossible, before adjourning *sine die* at 3:45 in the afternoon.

HARDLY had the vote of adjournment been taken, however, when negotiations for a second conference were under way, and plans laid for a new meeting at which a legislative committee, appointed by and responsible to the legislature of Arizona and not to its governor, would represent that state in the discussion with the Nevada and California delegations, who are reported to be willing to make another attempt to establish a common ground of agreement among the three states.

Governor Hunt's statement, which displeased the visiting delegations and led to the premature adjournment of the conference, was an address of several thousand words, personally presented by the executive as the first order of business after the meeting was convened.

"Gentlemen," he began, "you meet here today in conference in an endeavor to find a remedy for, and to reconcile some of the defects contained in, the Colorado River compact, which was negotiated at Santa Fe, N. M. This compact purports to allocate the waters of the Colorado River in accordance with the terms of a uniform law passed by Congress and the seven states in the Colorado River basin."

Then follows a criticism of the compact which points out four "fundamental errors"; the first of which, as claimed by the speaker, is that the allocation of water is made on a basis of upper and lower basins rather than "between the states" as authorized by the law; second, that too much water has been apportioned to the upper basin and too little to the lower; third, that no provision is made to prevent water stored in the United States from being applied to Mexican lands; fourth, that while upper basin states would be served from the natural flow of the river, the lower basin would have to depend on storage entirely, and that no allowance is made for loss by evaporation from stored water.

"Why," asked Governor Hunt, "should any compact be negotiated which sets aside the present well-established and defined water laws?" And he answers his own query by pointing out, as a reason: "the far-sighted business acumen of some of the states in the basin who are endeavoring to secure, for use in the distant future, rights which they do not possess under the law."

"The upper basin states are demanding all they can get for themselves," he declared, with vigor. "Why should we not do likewise?"

ANSWERING his own question "What does Arizona want from the Colorado River?" the speaker candidly declared that he did not know.

"At this time all we ask for, if the economic laws are to be set aside and a treaty negotiated, is that Arizona receive protection of her rights including her future development. If you ask me specifically what we want I reply to you frankly, without any apology, that we do not know because we have not sufficient data available to determine what it is practicable to develop.

"Arizona is in the position, if the present water laws remain undisturbed and unimpaired, of asking nothing. We are fully satisfied with the present laws as interpreted by the United States Supeme Court. We are fully able, under present laws, to protect our interests from all of the other six states in the basin and from Mexico. We do not fear development in Califonia or in the upper basin if the law of priorities, based upon appropriation for beneficial use, remains in full effect. But if that law is to be disturbed, modified or set aside, we have immediate cause for alarm."

It was apparently this attitude of being satisfied with the status quo that convinced the visiting delegations of the hopelessness of further discussion. Governor Hunt's whole thesis was that "economic law and self-preservation dic-

tate our policy in this matter," and that if Arizona has something which her sister states want, it is for them to make a proposition that suits Arizona.

"If Arizona signed the Colorado River compact in its present form we would be signing away our future right to utilize the resources of the river without recompense. If we have something you want and can utilize, economic justice dictates that it be paid for."

The statement concluded: "At this time Arizona is asked to negotiate and distribute resources from the biggest asset she has because some other sections of the country assert that the immediate development of this asset is imperative to their welfare. We are unprepared to negotiate but if an adjudication can be worked out that sounds anywhere near fair and equitable to this state, I shall be very glad of the same. I stand ready to co-operate with you and to make available any information we possess. I trust that your labors may prove successful."

WHILE the California and Nevada delegations persisted in regarding this statement as an "ultimatum" which must necessarily bind the Arizona committee and thus make further conference useless, the Arizona representatives contended that they were not necessarily bound by the governor's statement and attitude, and for their own part, asserted that the Nevada delegation had come with preconceived ideas that made the effort to reach a common agreement a vain hope.

The Arizona committee, whose official personnel was comprised by Cleve Van Dyke, Miami; Thomas Maddock, F. A. Reid, and H. S. McCluskey, of Phoenix; and A. T. McGregor, of Warren; issued a statement after the close of the conference which placed the onus of its failure on the Nevada and California committees. The statement declared:

"The committee appointed by Governor George W. P. Hunt, to confer with the committees representing the States of California and Nevada, were left by the Governor absolutely free to act, without any instructions as to any particular reservations that Arizona should ask for in connection with any development undertaken on the Colorado River.

"The Arizona Committee stated openly that they were in no wise bound or limited in their discussion except by their conscience and their duty to their state; that any conclusions or agreements that might be reached would be tentative in form and would have to meet and stand the test of the criticisms of the legislatures of the three states and of Congress and possibly of the other states in the basin and would have been subject to possible modifications and amendments.

"The California and Nevada committees advanced an arbitrary and impossible promise as a basis upon which negotiations or even discussions by the joint committees could proceed. Their ultimatum, as a prelude to any negotiations, or even discussion, provided that Arizona must unreservedly agree that the first construction of dams on the Colorado River should be at Boulder Canyon or its vicinity. They would not even agree to a discussion concerning the allocation and distribution of the water and power made available by the Boulder Canyon Dam until Arizona had agreed to the principle that the initial development should be at that location. This in effect means that it was demanded of Arizona that she sign a contract in blank on the dotted line, the terms and conditions of which would later be inserted in the document.

(Continued on Page 28)

Oregon Irrigation Congress To Discuss Vital Problems

GRANTS PASS, Oregon, will be the scene of an irrigation gathering of more than ordinary interest on October 5, 6 and 7, when the Oregon Irrigation Congress will be in session there. A program of practical value, dealing with the pressing water problems of the northwest, has been arranged by the officials of the Congress, and those present at the meeting will include many of the outstanding irrigation figures of the nation.

James M. Kyle, president of the Oregon Irrigation Congress, has given out the following statement for publication in MODERN IRRIGATION:

"THE NEXT annual meeting of the Oregon Irrigation Congress will be held at Grant's Pass, Oregon, on October 5th, 6th and 7th. It is expected that this gathering will bring out a large attendance, as some very important matters will come before the Congress—such as the problem of state co-operation with the federal Bureau of Reclamation, in reference to aided and directed settlement on federal projects. The matter of refinancing state projects which now need help will also come before the meeting.

"Personally, I do not believe in state aid for Government projects," writes Mr. Kyle, "for if state aid is to be demanded as a condition precedent to the government undertaking the development of any irrigation project, the requirements thereof should be designated in a bill of general application. It should become a general policy of the government rather than a policy to be applied to one project and withheld from another, and there should be uniformity running through the whole plan or program. Changing our whole policy of reclamation by an appropriation bill so worded as to affect one distinct project is an absurdity.

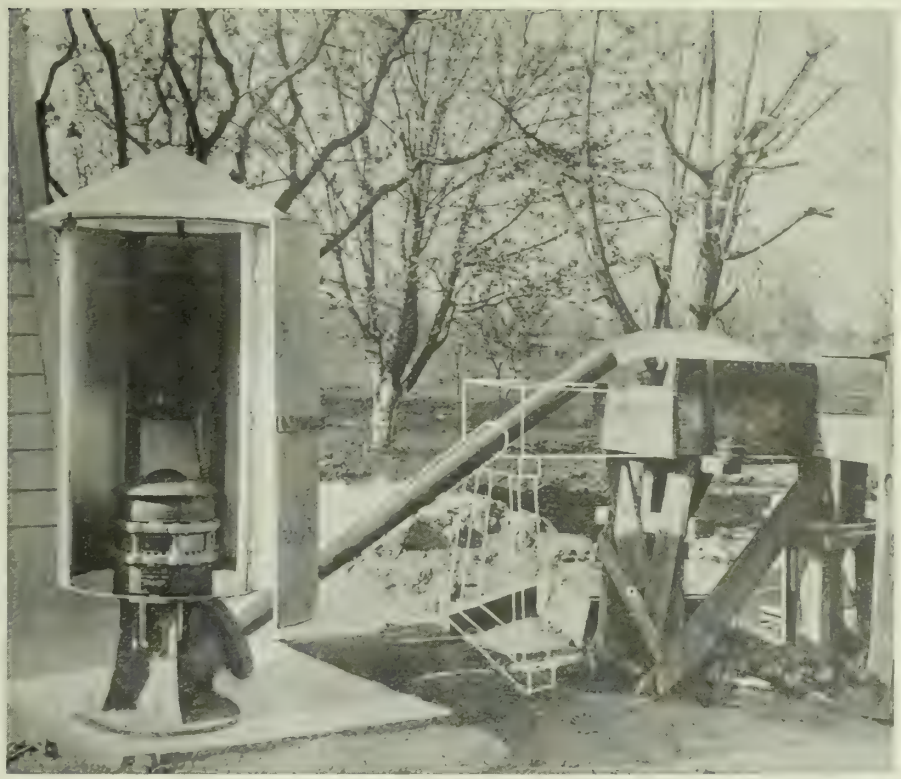
"It is not the proper field for state activity; it is not proper that a state should be called upon to aid the federal government in this work. The money used in reclamation does not come from the general treasury of the United States; it is created by the states themselves wherein these projects are located, and the theory of the law, and the reason therefor, was to make government lands inviting to private ownership."

AS FORESHADOWED by Mr. Kyle's statement, state and federal reclamation policies, in which Oregon is vitally interested, will have the spotlight of attention during part of the Congress. Senator McNary and Senator Stanfield, Oregon's representatives in the upper house of the national congress, will be there, Senator McNary's voice having added influence on account of his position as chairman of the senate committee on irrigation and reclamation.

W. L. Boise, chairman of the Land Settlement Committee of the Portland, Oregon, Chamber of Commerce; Roderick Maclay, President of the Portland Chamber of Commerce; and Marshal Dana, of the Oregon *Journal* are expected to be present to participate in the discussion. Elwood Mead, Commissioner of Reclamation, will either attend the meeting or be represented officially.

I. L. Patterson, of Salem, Oregon, will discuss "Irrigation in the Willamette Valley," and Franklin T. Griffith, President of the Portland Railway Light and Power Company, will speak on "State Development."

A distinguished guest of the Congress will be Governor Walter M. Pierce, who is actively concerned in irrigation both by inclination and by virtue of his official duties as chief executive of the state. Governor Pierce will deliver an address on "Agriculture in Oregon."



SIMPLE CHANGES LIKE THOSE HERE INDICATED MAY EFFECT A CONSIDERABLE SAVING IN THE ANNUAL POWER BILL

The Irrigation Engineer Must Figure Every Penny

By JOHN R. JAHN

Irrigation Engineer

THE FEASIBILITY of an irrigation plan is often dependent upon the probability of there being an adequate return on the necessary capital outlay. Careful consideration of the major economic problems involved is customary in the design of all large projects. There are so many examples of uneconomic design in the smaller units of equipment, however, notably in connection with pumps, piping, and field ditches, that the minute consideration of these features needs to be emphasized. Care in these designs will result in larger profits to the farmer, who depends on the yearly excess of income over outgo.

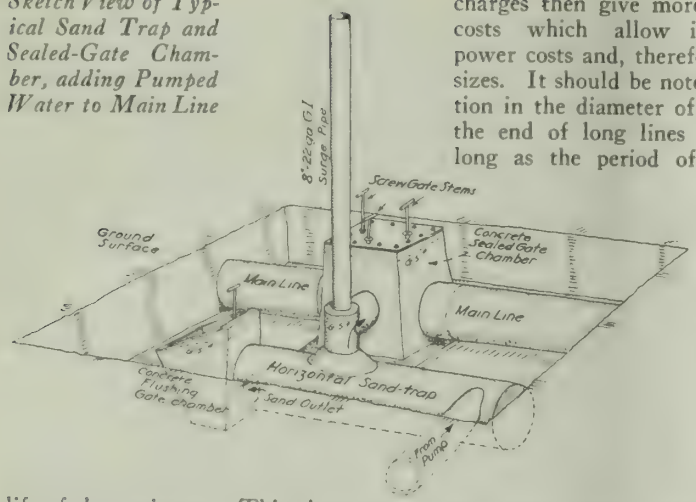
Among all of the applied sciences, probably none allow of such critical analysis, from an economic standpoint, as does irrigation hydraulics. Here we have certain work to be performed by the expenditure of funds for the installation and maintenance of equipment. The "best" selection is the one which satisfactorily performs the service for the least ultimate cost. The considerations in this ultimate cost involve (a) first cost and (b) annual expenses. Selection also considers (c) adaptability and (d) dependability, the money value of which are matters of judgment.

The first cost is often given undue importance, allowing the future to care for the others. In this way second hand pumps of incorrect size, pipe conduits too small in size, and small wells, are often installed because of lower first cost. The consequent annual charges may then be out of all proportion to the first cost. The writer recently had occasion to check up the discharge piping from a 36-inch centrifugal pump which was designed to deliver 67 second feet through a 42-inch riveted steel pipe having a length of but 150 feet. It was found on analysis that the annual cost of power for overcoming friction in this line, if capitalized at 6 per cent, would pay for a parallel line of 42-inch pipe and in addition have the interest on $3,000. While the first cost of the single line seemed high, it is apparent that double the expenditure was justified.

TABLE OF FRICTION FACTORS FOR VARIOUS KINDS OF PIPE

Kind of Pipe		Range Gal. p. min.	Range Cu. ft. p. sec.	Friction Factor ft. p. ft.
Wood Stave Pipe	from	500	1.1	.002
	to	9,000	20.0	.0005
Concrete Pipe	from	300	.67	.003
	to	4,500	10.0	.0008
Low Pressure Riveted Steel and Galv. Iron Slip Joint Pipe	from	100	.22	.004
		700	1.55	.0015
	to	40,000	60.0	.00065
Wrought Iron (Screw joints)	from	5		.015
	to	500	1.1	.007

THERE are two methods of economic analysis, both of which compare expenditures in the attempt to obtain the lowest ultimate cost. They give, however, different results. One method, the usual one, capitalizes annual charges at current rates of interest and adds that to the first cost, the selection showing the lowest combined cost being indicated. The second method amortizes the first cost to spread it over the probable life of the equipment, adding thereto the annual charges. The selection showing the lowest total annual charge is then indicated. The second method is preferable to the first in that its selections have smaller size and consequently lower first cost. This is due to the fact that while the first method capitalizes the annual charges at the current rate of interest, the amortized charge is based on the interest rate plus a rate which will write off the capital during the estimated



Sketch View of Typical Sand Trap and Sealed-Gate Chamber, adding Pumped Water to Main Line

life of the equipment. This gives greater influence to first cost and less to annual charges, resulting in smaller size selections. If, however, in the first case depreciation is charged at a rate equal to the amortization rate of the second case, the results will be the same by either method. Upkeep should be distinguished from depreciation as that is necessary to make the equipment serve up to the last month of the last year of its life and will be an item in the annual expense of operating the equipment and should be the same in either of the two cases.

THIS principle is clearly demonstrated in the case of pipe lines conveying pumped water. The first cost is represented by the following items: list price of the pipe, less discounts, freight, cartage, excavation, installation and back fill. Annual charges include as the principal item the cost of the power necessary to overcome the friction of the water when flowing in the line. However, pipe lines do not always wear out but may lose their usefulness through soil depletion, subdivision of land, obsolescence of machinery, etc. A useful maximum life of 20 years would then indicate an amortization charge of about 9 per cent. Excessive rust conditions in iron pipe or alkaline soil solutions in concrete would reduce the life and increase the annual charge. The writer found that a sliding scale of friction factors could be determined which would represent the pipe size having the minimum ultimate annual charge as indicated by the second method. In the table on this page these factors are given in feet per foot of line. Intermediate values can be found by interpolation. Having the friction factor, which gives the slope of the hydraulic grade line, the pipe size is readily determined by the use of tables or graphs. These values are for low pressure heads. Higher pressures mean stronger material or greater first cost. Higher amortization charges then give more weight to first costs which allow increased annual power costs and, therefore, reduced pipe sizes. It should be noted that no reduction in the diameter of the pipe toward the end of long lines is economical as long as the period of seasonal use is constant. This is due to the fact that first cost and friction losses are constant all along the line.

IT IS obvious that an economic balance between the use of pipe and open ditches exists whenever the value of the water, value of the waste land or cost of labor is high. The use of concrete pipe in the orchards of Southern California, for example, in place of open ditches, is increasing rapidly and is economical.

The selection of the best size of a pump for an irrigation supply is a complex economic problem. The development of centrifugal pumps of good efficiency has resulted in their general use and we nw have many types, viz: horizontal (direct connected, or belt driven, single or double suction, single stage or multi-stage); vertical (single suction or vertical submerged) turbines (and multistage verticals), and screw pumps (horizontal or vertical). Each has a particular field and relatively high efficiencies within the pump are now obtained.

It should be noted, however, that for any make and type there is usually but one pump size and one rotation speed, which will give maximum efficiency in lifting a definite quantity rate of water to a definite height. Selection of pump sizes is usually left to pump manufacturers who are willing to give a guaranteed efficiency proposal but the engineer can often exercise judgment in selecting general types. Thus, a belt driven pump to run at its most efficient speed, and driven by a high speed motor instead of a direct connected pumping unit, might be chosen by economic analysis in which the lower first cost of the high speed motor and the better efficiency of the pump are the deciding factors.

The appropriate field for the engineer is in the design of the assembled pumping plant. The design of plant covers such items as pump, motor priming set, check or gate valves, pump house, pump pit, screens, suction line, discharge line, taper pipe connections, electrical connections, etc., all of which enter into first cost and into annual power and maintenance costs. The cost of pumping against unnecessary friction, of drawing water from an excessive depth or lifting higher than necessary represents the interest on wasted capital. A higher initial expenditure may materially reduce the annual charges against capital and upkeep and give low ultimate cost.

ONE of the most apparent losses is in discharging the water at a higher elevation than necessary. Water is pumped, for instance, ot fall noisily into a ditch or standpipe, the idea apparently being to show the value of the service by the noise made. Futhermore the vertical sand trap, in which water rises in a pipe to fall over a baffle-wall, losing its sediment enroute upwards, represents needless waste of power. The same pipe without the baffle-wall, laid horizontally either underground or below the hydraulic grade line with a cleancut gate in one end and water entering and leaving the closed chamber on grade, will represent a saving of power and possibly in first cost.

This Chart Shows the Relation between Pump's Size and Speed to Capacity and Lift for Maximum Efficiency. (G. W. Price, 1920 Horizontal Centrifugals.)

What Shall We Do to Protect Our Natural Water Storage Reserves?

Future Supply of Water Depends on Protection of Brush and Forest Cover of the West

By HARVEY S. BISSELL

First Vice President, Conservation Association of Southern California

WHEN Richard Henry Dana sailed around the Horn and reached the shores of Southern California in 1835 to exchange merchandise for hides and tallow, those were the only things that the arid west then produced. Its valleys were sunbaked plains—arid and semi-desert. Today, these valleys produce every crop known to the temperate zone. These valleys, made fruitful by man, are the most valuable, acre for acre, in the United States, because they are highest in production and highest in value of yield. The yearly agricultural products of one western county alone are valued at about one hundred million dollars.

What has wrought this miracle? Intelligence, industry and *water!* With water everything is possible. Without it we return to the desert. Water is the one limiting factor, not only to our agriculture, but to the potential population that the irrigated west can support. Our whole social and economic structure is built upon the permanence of our water supply. Water is our greatest asset and the barometer of our prosperity and growth.

Yet how few of us, whose very existence is dependent upon it, give serious consideration to its perpetuation! We take it for granted, like God's other gifts —the sunshine and the air, until the streams fail or the pump begins to suck air. Then we lower the pump and get water a little longer (perhaps at the expense of our neighbor). We may be able to repeat this a number of times and get water at an ever increasing cost until this cost becomes prohibitive or the supply fails altogether.

This problem is especially pressing in Southern California, but if we discuss it from the point of view of that section of the country, let us remember that it is not a local problem. It is a national problem, and demands national attention.

THERE is only one source of water. That is our annual snow and rain crop. Practically all of this comes during a few months when our water requirements are at their minimum.

It is a matter of common knowledge to those who have studied our water problem that our summer water supply is limited to that part of the winter rainfall which is so retarded from run-off by our watershed forest cover that it is held in the mountains or is discharged from the canyons at a rate that can be absorbed into the subterranean reservoirs of our alluvial valleys.

The amount so conserved for future use is dependent not only upon the amount of watershed area, but upon its quality. Every brush fire reduces that area just so much and reduces the quality of the future cover. It is conservative to say that it takes twenty-five years to restore a good cover and fifty years to restore one as good as we now have in the few places that have so far escaped destruction. When fire destroys the brush cover it so exposes the surface soil on the steep surfaces of our mountains to winter storms that the soil accumulation is eroded away, destroying for many years their capacity of absorption.

As fire succeeds fire the cover is more and more composed of the smaller and poorer varieties, and trees soon disappear. The losses of cover not only are progressive, but cumulative. That is, the cover is constantly deteriorating and the area denuded is increasing for the fire areas of this year are added to those of last year and year before last and so on for the full period required for restoration.

THE RETARDING of the run-off of the winter rains not only conserves this water for beneficial use, but serves another purpose almost equally important. That is, the checking of disastrous floods. Floods come in years of great rainfall or when the rate of precipitation is very heavy. If it were not for the brush cover almost every year would be a flood year. Years like 1914 and 1916 would devastate our valleys and cities to an extent that cannot even be imagined by anyone who has not seen the run-off from a burned-over watershed in a year of real flood.

We can do much to help nature control floods, but do not let us forget that without the cover which is nature's control, we can do nothing. Nor let us forget that since the last flood we have lost over a quarter million acres of good cover.

This cover also serves other purposes not so generally recognized. It has a very considerable effect on our climate. It is recognized that air currents move more rapidly over bare surfaces than over forested areas. This action of the brush, in retarding the fall of the cold night air from the mountains which starts at sunset and brings the evening chill, tends to lessen sudden frost temperature. It also tends to lessen both the frequency and the severity of wind storms. It is also well known that air passing over a green cover is noticeably cooler in summer than that across open spaces. This is frequently noticed when passing a field of green alfalfa on a hot day. This action of the brush cover tends to temper the summer heat. One of the most detrimental atmospheric conditions to ranchers, as well as the most trying to the nerves of all of us, is our hot dry winds. This wind passing over a brush covered area absorbs the moisture transpired by it, and is less hot and dry.

The scenic and recreational value of the mountains where the brush and forest cover have not been destroyed is so generally recognized that it is hardly necessary to comment on it. It is one of the great natural assets of the west—not only as regards pleasure and health, but in the dollars and cents it brings in from tourists. It is inconceivable that people should not preserve such an asset, a thing so vital to our prosperity and our very existence in this semi-arid country, yet we are destroying it year by year; some years only a few thousand acres, but others—like last year—seventy-five thousand; and in 1919 a couple of hundred thousand.

CHAMBERS of Commerce, business organizations, service clubs, women's clubs, legion posts and individuals must take a part in a great program of protection. The Forest Service is active, and alive to the great danger, but circumscribed by lack of funds, and the greatest obstacle of all—public apathy.

Elbert Hubbard describes this as "slipshod carelessness and dowdy indifference." The public neither realizes its danger nor cares. What if forests burn?

Checks should be made payable to Petroleum World Publishing Co.

VOL. I SEPTEMBER, 1925 No. 3

Weeds in the Garden

THE FIELD of irrigation is, it would appear, peculiarly susceptible to the growth of controversy and dissension. The casual observer, looking over the irrigation horizon, is at once struck by the fact that the most obvious phenomena upon every hand are connected with factional discords.

Arizona is divided over the development of the Colorado River and her sister states of the West are, to a greater or a lesser extent, aroused by the same troublesome subject. The Imperial Irrigation District of Southern California is torn by internal strife, in the course of which public officials of Imperial County, in which the district is located, are threatened with recall, four of the directors are under grand jury indictment, and a policy of re-organization undertaken by them has been ascribed, by unfriendly critics, to motives other than its ostensible basis of economy. In Oregon, irrigation and reclamation organizations are making indignant charges against the national Bureau of Reclamation, asserting that those in control, who are supposed to befriend and foster reclamation development, have turned upon it as traducers and detractors. From other sources, meanwhile, come expressions of approval for the present policies of the Interior Department; and a court decision in Idaho sustains the government in its action in shutting off water to compel payment from settlers. In Washington, enthusiasts who favor the immediate development of the proposed Columbia Basin project are temporarily discouraged over the unfavorable report just returned by an investigating commission, but will doubtless renew their efforts to secure favorable Congressional action, in spite of that negative verdict.

These are but a few of the disputes that flourish luxuriantly in the friable soil of irrigation. They are cited only to show one side of the picture of the industry. They are indications that it is alive; that it is intensely competitive; that it is young; and that irrigation has not yet reached the status of an exact science.

INCIDENTALLY, they demonstrate how hopeless would be the task of a publication that attempted to take sides in these controversies; or that undertook to champion one faction as against another in every temporary dispute or discord. Such a publication not only would be "riding for a fall," quite likely, but would place itself in a ridiculous light with the entire industry in attempting to settle, *ex cathedra,* great controversial questions over which technically informed students of the situation, who are sincerely eager to ascertain the truth, are themselves not able to agree.

But, fortunately for the men who are devoting themselves to constructive work for irrigation, the quarrels and the feuds are only a transitory phase of this great industry. They bulk larger in the public eye, and attract more attention within the irrigation brotherhood itself, simply because they are the more spectacular things. This, too, is a fortunate thing for an enterprise such as MODERN IRRIGATION, which in its third issue, is rapidly getting its bearings, so to speak, with relation to the industry at large. There are plenty of constructive, affirmative things going on in the industry for the observer to mark and record. And these are the things that will endure.

More Significant Things

MORE important to Arizona than the oratory which emanates from the state house, is such a development as that going on in the Roosevelt Water Conservation District, described in detail in another part of this issue. More important to California than a dispute in the Imperial Irrigation District are the plans that are being laid for developments such as the proposed King's River super-district, a $30,000,000 project, or the Pine Flat Reservoir $20,000,000 bond issue that is contemplated. Such are the types of developments which MODERN IRRIGATION will record and give its first attention to.

Constructive work of this kind is going on in all parts of the irrigation country. The recent dedication of the American Falls Dam, in Idaho, with appropriate

POINT *Of* VIEW

ceremonies, marked the culmination of a step in just such a task. A constructive program which will involve the expenditure of over $10,000,000 is now under way at American Falls, to extend over a period of five years to seven years. The American Falls Dam itself represents a cost of $8,000,000.

MODERN IRRIGATION will publish in an early issue a description of the American Falls developments, prepared for this magazine by Warren G. Swendsen, Commissioner of Reclamation of the state of Idaho.

A Statement of Policy

SPEAKING at American Falls on the occasion of the dedication of the dam, Secretary Hubert Work declared: "The United States last year imported about $425,000,000 worth of crude foodstuffs and food animals, exclusive of wool and cotton. It is idle to change our production of farm products and limit them to compel higher prices until we are producing more than we consume."

This statement of policy will be of real interest to every one who is anxious—as so many are—to find out exactly what is the attitude of the Administration toward reclamation. Diplomatically worded statements emanating from "administration spokesmen" have sometimes seemed to carry an implication that farm production ought to be limited, and the extension of agricultural land ought to be delayed, because market prices for the commodities now produced are not all that the farmer would like to see. The attitude of the Interior Department must, necessarily, reflect the policy of the president, and some observers have read into statements from both of these sources a serious lack of enthusiasm for reclamation on the ground that reclamation means, in the last analysis, an addition to the supply of farm produce.

Secretary Work's words, quoted above, ought to prove an effectual refutation of any such impression. By this declaration he has committed himself to a belief that limitation of production is not the way to improve the prices which the farmer receives for his goods. In such a conviction he is in agreement with those who favor an expanding policy of reclamation of the arid lands of the West.

Asking Co-operation

RANCHERS in Southern California are entering upon the last lap of a "dry season", which has been the worse because it has followed several previous dry years. Many of these ranchers are prosperous citrus growers who are apparently, by the ownership of their own pumping plants of adequate capacity, independent of temporary water shortages. They note, however, that they are raising their water from greater depths than usual—obviously the underground supply has been depleted by the abnormal drouth. But they can afford to do the extra work; they have the necessary power and the equipment; and they simply go farther into the earth for their necessary supply.

An article in this issue by Raymond Nebelung, prominent horticulturist of Orange County, California, is addressed primarily to these prosperous ranchers. These irrigators, points out Mr. Nebelung, are really drawing from a common source, and the evidences which they encounter that that supply is abnormally small are the plainest kind of signs that they must rigidly conserve every drop of water which they pump for use in their orchards.

Whether such a warning will be effective depends upon the development of the co-operative spirit in the Southern California rancher. Elbert Hubbard has called the ability to co-operate "the highest manifestation of man's intelligence." Co-operation is a doubly difficult thing to attain, however, when there is no evident penalty attending non-cooperation. The penalty which threatens to visit the Southern California farmer who persists in using water without regard for its conservation or the depletion of the underground supply is the prospect that before that supply can be naturally replenished it will be all consumed, and no one, no matter how generously endowed with pumps and power, can find more of it in the earth.

But the farmer who has learned to cope with the technical, financial and cultural problems of a successful ranch is, as a rule, of more than average intelligence, and, with the situation laid before him as lucidly and completely as has been done in Mr. Nebelung's article, he may be depended upon to do his share in conserving the limited supply for his neighbor and for himself.

A Larger Audience

IN THE WEST there is a peculiar identification of interest between the municipal water works, the water company serving domestic users, and the rest of the hydraulic and irrigation field. MODERN IRRIGATION has seen an opportunity to enlarge its usefulness by incorporating a department devoted exclusively to the interests of water companies of this type. In this issue an humble beginning is made in that direction, which is to be followed up, however, with a consistent effort to direct the editorial policies of the magazine so that it will appeal not only to those who are interested in the development of water for agricultural purposes, but, to an increasing extent, to the large body of technical men and executives who are concerned with supplying the water needs of centers of population, and who often face hydraulic problems as difficult and as complex as those confronting any irrigation project.

Abortive Conclusion of Phoenix Conference Arouses Storm of Editorial Criticism

Governor Hunt Attacked and Defended by Editors of Southwest; Seen as a "Protector" and "Trifler"

THE TRI-STATE Colorado River Conference, which convened August 17, at Phoenix, and its abortive break-up, gave rise, naturally, to many variant editorial expressions as diametrically opposed in their points of view as those represented by the several irreconcilable attitudes of delegates at the conference itself.

Several Arizona organs echo the words of their Governor with approval and unite with him in condemning the Colorado River pact as a defective and unjust document. The Phoenix *Arizona Gazette,* on the day of the conference, before word of its adjournment had been given out, sounded the opposition which a large section of Arizona unquestionably feels to this compact in a leading editorial of which the following paragraphs are representative:

"We have no suggestion or advice for the Colorado River conference which convenes today excepting to say that fair justice must approve every proposal, else it will not finally be approved by the people of Arizona. We cite the Colorado River compact as an example of what we mean. It was thrust upon the people of Arizona with the apparent expectation that it would be swallowed like a sugar-coated pill. But the longer the people studied that compact, the more nauseous became the dose. That compact will never be ratified by the voters of Arizona.

"The Boulder Canyon dam will not be approved by the people of Arizona because it is not an irrigation but a power dam. And Arizona insists that a dam be built far enough up the river to afford the largest possible irrigation by gravity. The future of Arizona depends upon the irrigation of the largest possible portion of its irrigable lands. These lands are the most fertile to be found anywhere. If the Boulder Canyon dam is constructed, no lands may be irrigated in Arizona without pumping, and that is too expensive a process to be at the same time both practical and profitable."

AFTER the sensational break-up of the conference, many Arizona editors charged that Governor Hunt's message was merely the ostensible justification for the debacle, and that the preconceived ultimatum of the visiting delegates was the real obstacle to a harmonious and constructive meeting.

The Tucson *Star* sums the situation up in these words, which are quoted, with approval, by the Tombstone *Epitaph*:

"Governor Hunt's statement was the excuse, not the reason, why the Arizona and Nevada delegates walked out . . Governor Hunt is openly on the defensive; he wishes to protect Arizona's rights in the Colorado River to the fullest extent . . . Certainly it would be folly to accept a flat ultimatum from our neighbors and then discuss the ways and means of handing the river over to them."

The Prescott, Arizona, *Courier,* says, quoting a letter from H. S. McCluskey, Governor Hunt's secretary: "The governor's message, strictly speaking, had very little to do with the failure of the conference. The California-Nevada committee had their stipulation all ready for submission, and it was immediately submitted, demanding unqualified surrender and the signing of an agreement to support the building of a dam at Boulder Canyon . . . We could not agree to any such stipulation."

AFTER the explosion of such a bomb-shell by the Governor the reader would expect to find the Phoenix *Arizona Republican* outspoken in its characterization of what it calls his "wild war-cry," and is not disappointed. The *Republican* is published by Dwight B. Heard, Governor Hunt's political opponent and former gubernatorial rival, and it quite boldly asserts its belief that the conference was never intended to have any other culmination than the one which adjourned it so abruptly. Says the *Republican*:

"No doubt some of the members of the Arizona delegation appointed by Governor Hunt were earnestly desirous of arriving at a solution, but we think that there can be no doubt that a part of the delegation understood that its business was the creation of an impasse such as was suddenly reached.

"The keynote, a wild war cry, was sounded by the governor in his address in the morning session. That created a tenseness which was not relaxed, notwithstanding the assurance of some of the members of the Arizona delegation that their hands were free. From that moment what slender hope there may have been that an agreement might be reached was abandoned."

MUCH of the *Republican's* rebuttal is directed against Governor Hunt personally, but it concludes with a criticism of his policy as unrepresentative of the majority of Arizonans, which is interesting as a statement by an acknowledged spokesman of the attitude held by the considerable anti-Hunt faction of the state:

"We know that this spirit which sways and has always swayed the governor does not animate the great majority of the people of Arizona. They want something done with the river and many of them are agreed upon a definite plan for doing something by which they will make the river a source of revenue for a sorely burdened state whose burden is increasing year by year. It is proposed by co-operation with our neighboring states, to unite with them under the sanction of the federal government and with its financial aid, to create works for the development of electrical energy which will bring to this state a large revenue from power generated within the state and sold and used without the state. We have the most positive assurance that this can be accomplished, if it is undertaken in a spirit of cooperation. And in the accomplishment, no right of Arizona will be surrendered. No future benefit will be foregone."

"It is certain that the Colorado river is going to be developed and it is equally certain that Arizona within this generation or the next, cannot undertake its development alone. We have come to a time in the progress of the country in which it is demanded by industry and population, that latent resources shall be made active, and when dogs shall be driven out of the mangers.

"We believe that we are in the closing phase of the consideration of the Colorado question. We by no means mean that the conference yesterday could have been a determining factor. It could not have had the slightest effect upon the outcome. Its failure does not indicate that Arizona has finally spoken, or, indeed, has spoken at all. There will no doubt be other conferences. What we

(*Continued on Page 28*)

THE IRRIGATION DIGEST

A Monthly Bulletin Board of Brief Facts and Events from Far and Near

Santa Maria, Calif.—In the past five years the number of pumping plants in northern Santa Barbara County has increased from 50 to 455, and more than 100 miles of irrigation pipe has been laid. The increase in both pumping plants and pipe mileage is continuing at a rapid rate.

Phoenix, Ariz.—Nearly 1000 acre-feet of water per day is being pumped by water users in the Salt River Valley. This amount is nearly one-fifth of the total requirements of the area served by the Salt River Valley Water Users' Association. Many association pumps are being replaced by larger installations.

Los Angeles.—A carefully worked-out model of the Colorado River at the proposed Boulder Canyon dam site has been constructed by Walter G. Clark, consulting engineer, and will probably be on display at the offices of the Los Angeles Chamber of Commerce. The model is said to have cost $7,000 to build. It is made of papier mache, on a scale of one inch to twenty feet.

Riverside, Calif.—Proceedings have been initiated by the Palo Verde Irrigation District for the condemnation of a right-of-way for a drainage canal. The district includes 88,000 acres of land in Riverside and Imperial Counties. In the complaint filed in the Superior Court of Riverside County, it is recited that the Colorado River at certain seasons of the year leaves sub-surface waters in the district which render the land alkaline and require the construction of the projected canal for drainage.

Oroville, Calif.—Improvements on the irrigation system of the Oroville-Wyandotte Irrigation District to cost $100,000 have been authorized by its Board of Directors. In addition to the enlargement of flumes and ditches, the chief improvement contemplated is the substitution of 3,200 feet of pipe for five and one-quarter miles of ditch in the Bidwell Bar Canyon.

Villa Park, Calif.— The Villa Park-Olive Farm Center, at its regular meeting, was addressed by S. E. Saunby, member of the public utility committee of the Orange County Farm Bureau, who spoke on "Orange County's Greatest Problem — Water." The speaker outlined four methods of saving water, namely, reforestation, greater spreading activities, closer observation by growers of the amount of water used in their groves, and reclamation of sewage water.

Portland, Oregon.—Forest fires to the number of 854, burning over a total acreage of 12,739 acres, have been fought in the national forest regions of Oregon and Washington in 1925, according to a statement released by the United States Forest Service in August. Lightning was responsible for 600 of the fires, while of the man-caused fires, 104 were ascribed to campers and 69 to smokers. Dry electrical storms have been unusually bad, causing a greatly increased number of fires.

Safford, Arizona. — C. H. Southworth, engineer in charge of construction of the Coolidge Dam at San Carlos, in a recent statement declared that the new route for the Arizona & Eastern railroad across the San Carlos Indian reservation, made necessary by the fact that the impounded waters will cover the old route, has been finished, and the cost of moving the railroad to the new route will be about $1,500,000. The railroad's estimate had been twice that amount.

Nampa, Idaho.—Definite steps have been taken leading toward the dredging of Indian Creek at Nampa. Councilman Rosenlof, of the city board, a former director of the Nampa and Meridian Irrigation District, has been named chairman of a committee in charge of the work. The irrigation district board, the Union Pacific Railroad and the management of the Boise project are to be appealed to for co-operation in completing the task, which will cost only $40,000.

Tucson, Ariz.—The Tucson Gas, Electric Light and Power Company has made a connection with the power system of the Pima Farms Company, by which the 1500-kilowatt turbine plant of the latter organization will be available for furnishing current to the power company. The Ivydale-Owen Company, south of Tucson, is preparing to install a new electric plant, at a cost of $100,000, for the operation of its pumping system. Power will be furnished by a large Diesel installation.

Vale, Oregon.—The executive committee of the Oregon Irrigation Congress, in session in August, adopted and forwarded to Hubert Work, Secretary of the Interior, a strong resolution requesting that construction work be commenced without delay on Oregon projects which have been investigated by his department and pronounced feasible. The executive committee includes: W. A. Steward, of Baker, chairman; Wilford Allen, of Grants Pass; R. H. DeArmond, of Vale; John S. Beall, of Portland; Geo. Aiken, of Ontario; D. H. Nelson, of Pendelton; C. G. Brownell, of Portland.

El Centro, Calif.—In renewing the contract under which the Imperial Irrigation District is allowed to construct brush weirs in the Colorado River to raise the water above the intake during the summer season, the Imperial district and the Yuma County Water Users' Association have negotiated an agreement the terms of which are more stringent than any previously in force covering the matter. The Imperial district has been placed under a bond of $500,000 to indemnify the Yuma organization for possible damages resulting from the construction of the weir. It is specified that no rock may be used in its construction.

Power Developments of 1925 Show Big Increase

Report of Geological Survey Indicates Ten Per Cent Gain Over 1924; New York Leads States

The Department of the Interior, through the Geological Survey, has released a report on the developed water power of the United States in 1925. The total capacity of water wheels installed in plants of 100 horsepower or more, in March, 1925, was about 10,038,000 horsepower, an increase of about 951,000 horsepower, or nearly 10½ per cent, over the total capacity of water-power plants in 1924 (9,087,000 horsepower). Of this increase 99 per cent was in electric public-utility plants and 1 per cent in manufacturing plants.

New York continues to lead the rest of the States in the amount of developed water power. The five leading water-power States in order of their rank and the amount of developed water power for each are as follows: New York, 1,713,551; California, 1,531,480; Washington, 560,693; North Carolina, 534,600; Maine, 476,627. North Carolina has moved from fifth place in 1924 to fourth place in 1925.

The report also contains records of the developed water power for 1924 and 1921 and the estimates of potential water power for 90 per cent and 50 per cent of the time computed in 1924. Based on present practice at fully developed waterpower sites the undeveloped water power in the five States leading in developed water power will permit of the installation of the following additional capacities in water wheels, expressed in horsepower: New York, 4,734,000; California, 7,145,000; Washington, 9,672,000; North Carolina, 526,000; Maine, 920,000.

The report indicates that water power development in the Middle Atlantic, South Atlantic, and East-South Central States is progressing more rapidly than in any other sections of the country. New England's relative standing continues to decrease. Development in the Pacific States during 1924 failed to keep up with the rate maintained by the rest of the United States.

Ramona District Organized

Ramona (Calif.) Irrigation District was officially organized in accordance with law on August 11, after official canvas of the poll of the question of organization had been completed and revealed a vote of 87 for the organization and four against it. R. L. Jerman was elected president of the district, and Miss Elizabeth Seay secretary.

Irrigation in Montana

Montana has nearly two million acres in irrigation districts and reclamation projects, according to records in the office of E. S. Heidel, State Engineer of Montana. There are 62 private districts organized under the State irrigation district laws, six projects under the Federal Carey Act, four under the United States Reclamation Service, and three under the Indian Service.

The largest of the private districts is the Toole County district, comprising 280,000 acres. The Crow Creek district in Broadwater County, has 52,273 acres; the Lower Yellowstone project in Richland County with 44,381 is third in size.

The Carey Act projects are: Billings bench, Billings, 39,000 acres; Big Timber, 30,599 acres; Valier, 180,000 acres; Teton, Helena, 17,725 acres; Flatwillow, Lewiston, 26,048 acres; Little Missouri, Butte, 26,000 acres.

The Federal Reclamation and Indian Service projects are, with their ultimate irrigable acreages: Huntley, Yellowstone County, 32,473; Milk River, Hill, Blaine, Phillips, and Valley Counties, 154,101; Sun River, Cascade, Chouteau, Lewis and Clark, Teton, 158,851; Lower Yellowstone, Eastern Montana and Western North Dakota, 59,259; Blackfeet, Glacier and Pondera, 107,500; Flathead, Missoula and Sanders, 124,500; Fort Peck, Roosevelt, 153,394.

How Evaporation Varies

Measurement of the amount of evaporation from a water surface has been made at numerous places by the U. S. Department of Agriculture. There is a wide variation in the depth of evaporation, it being 27 inches per year on the top of Pike's Peak and 101 inches per year at Prescott, Arizona. At Denver the evaporation is 69 inches, at Cheyenne 76 inches, and at Salt Lake City 74 inches.

The two things that cause a big evaporation are wind and heat. Probably of the two the wind has the greater effect, and during the hot summer days a high wind makes a very great difference in the evaporation. It is noted that the evaporation at Cheyenne and Salt Lake is approximately the same. The mean annual temperature at Cheyenne is 46 degrees and at Salt Lake 54 degrees. The difference in temperature is offset by the larger amount of wind at Cheyenne, the average hourly wind velocity there being 13 miles per hour, and at Salt Lake City the average is 7 miles per hour.

Idaho Court Sustains U. S. in Water Decision

Government Victor in Award by Judge Dietrich; Temporary Restraining Order Dismissed

That Government officials may shut off the water supply of settlers who are delinquent in their drainage payments was ruled in a memorandum decision handed down in August by Judge F. S. Dietrich of the Federal Court at Boise, Idaho.

The decision represents a victory for the government counsel, who have appeared for J. B. Bond, manager of the Boise project, defendant in an action brought by S. Clare Mower, of Caldwell, a settler. The decision also vacates the restraining order issued by Judge Brinck of the Ada County district court.

Mower claimed that the government had no right to shut off the water, after having started delivery. In regards to his plea for estoppel, Judge Dietrich holds that the "facts averred are thought to be insufficient. It may be that the defendant had induced the plaintiff to put in his crops during the current year with the promise that the demand in question would not be pressed until the close of the season, and if the plaintiff were financially unable to meet the demand, the defendant, though an agent of the government, should be enjoined from now shutting off the water in violation of such understanding. But the pleading does not go that far; it alleges only that the defendant did not promptly, at the beginning of the season, shut off the water. No inducements or misrepresentations are charged, and as before indicated, the allegation of the plaintiff's inability to pay is qualified and far from being satisfactory."

The plaintiff also contended that the waters remained the property of the state, under the state constitution, ratified by congress, and that if the government sought to divert water it must of necessity put itself on the same footing with other appropriators and comply with the state laws. The government contended, however, that until appropriated under state law, the waters of such streams as the Boise River are the property of the government, to be used without respect to state laws. The decision states that "No case has come to my attention fully supporting this view, but in some of the decisions from high source are to be found intimations that the government retains a measure of interest or control of some character."

Columbia Basin Investigators Submit Unfavorable Report on Project

A SPECIAL commission appointed by Secretary Hubert Work to investigate the feasibility of the proposed Columbia River Basin reclamation project has submitted its report, and the gist of its decision is that the time has not yet arrived when local and national interests require its construction.

The report points out that the cost of the Basin project has been fixed at $193,260,000, which is $158 per acre and that the Bureau of Reclamation is not possessed of the information needed to formulate a development plan as costly and complex as the one outlined for the Columbia River Basin. The commission making the report includes Elwood Mead, Commissioner of Reclamation, who is chairman, and John H. Edwards, Assistant Secretary of the Interior. The report reviews the investigation as follows:

"Homer J. Gault, for many years an engineer in the Reclamation Service was selected to conduct the work in the field; he made a thorough survey and investigation of the engineering problems of the project during 1923, being assisted by soil experts from the Department of Agriculture, and representatives of the Geological Survey who made studies of the water resources and of geological conditions as related to the location of various features. Mr. Gault's report was submitted in March, 1924. In this he outlined the result of his field work, discussed various alternative plans, and included the findings of the soil, geological, and water experts.

"His report was reviewed by a board of engineers taken from the staff of the Bureau of Reclamation, the members being A. J. Wiley, James Munn, and J. L. Savage. Their report devotes itself largely to a discussion of the reasons for the large increase in the estimates in the Gault report over those of former reports prepared under the direction of the State of Washington. Their conclusion was that this arises from differences in the estimates as to carrying capacities of the canals, the quantity of water required, its losses in transit, and allowances for overhead expenditures and contingencies; and that the Gault report presents a fair estimate of cost under the conditions prevailing at that time.

"On further consideration, it was decided, however, by your commission, to have a further review of Mr. Gault's report, and an independent investigation of the project which would include, along with engineering features, the settlement and farm development problems. This was required to make this report conform to the recommendations of the Committee of Special Advisers on Reclamation. This Board of Review was therefore selected, to include men who were not only eminent as construction engineers, but who were also familiar with the economic and agricultural aspects of reclamation. It was composed of six members: Louis C. Hill, of California; Charles H. Locher, of Maryland; Richard R. Lyman, of Utah; Arthur J. Turner, O. L. Waller, and Joseph Jacobs, of Washington. The report of this board was submitted in February, 1925. It considered five different plans, or schemes of development. The one favored embraces 1,224,000 acres which with the exception of 170,000 acres of pumping lands is to be irrigated by gravity, using the waters of the Pend Oreille and Spokane Rivers. The construction cost of the works is fixed at $193,360,000, which is $158 an acre. This estimate includes provision for drainage and contemplates the lining of canals to the border of each unit.

"This report agrees with previous reports in regarding the project physically feasible; the land is fertile, the water supply adequate, and climatic conditions make possible large yields of general farm crops, and a variety of orchard and garden products.

"The outstanding feature of this report is the attention given to the agricultural and economic requirements of the project along the lines of the recommendation of your Committee of Special Advisers on Reclamation. Two of the board's economic conclusions contained the following recommendations:

" 'That the State should assume its proper share of responsibility for collecting payments from the settlers, and should also bear its proper share of the losses, if any, incident to the development of the project.

" 'That the Government should clear and level the land and provide a reasonable financial credit for necessary farm improvements. Also as a guarantee against land speculation, and to insure that the settler secures the land at its fair value; that the Government acquire title to all the irrigable land within the project.'

"Your Commission has no doubt that the time will come when local and national interests will require the construction of these works, and the utilization of these immeasurably valuable resources. It does not believe, however, that this time has arrived; or that the Bureau of Reclamation is possessed of either the information or the experience needed to formulate a development program as costly and complex as the one outlined and advocated in this report."

Airplane Irrigation Survey

Engineers in charge of the preliminary survey of the Moorpark-Conejo irrigation district in Ventura County, California, will use airplanes in making a survey of the section.

Water 9500 More Acres

New canals which will carry water to 9500 acres of land in the Jordan Valley, Oregon, Irrigation District, have been completed by Morrison and Knudson, contractors.

Equipment Men in Session

Members of the Western Irrigation Equipment Association will meet at Sacramento, on September 11, in the regular bi-monthly meeting of the association, which will also be the regular annual meeting for the election of officers. The date of the meeting was planned purposely to fall during the California State Fair at Sacramento so that the equipment manufacturers and dealers attending the sessions could enjoy the fair as well, in which many of them are interested as exhibitors. Officers to direct the work of the association for the coming year will be elected.

Study Wasco County, Oregon

THE DALLES, OREGON.—Engineers, orchardists, and chamber of commerce executives of The Dalles recently completed a survey of the watershed of northern Wasco County and its possibilities for water development for irrigation. As the result of the survey, a complete report will be prepared and issued by the Chamber of Commerce as a preliminary to actual development work. Those making the recent trip which completed the reconnaissance of the water resources of the section were: W. S. Nelson, John Odell, and L. A. Schanno, representing the Chamber of Commerce; T. A. Sammis, Jr., Ray F. Kelley, Richard M. Weber, John Moore and Raymond Church, interested orchardists; R. A. Brouhard, photographer; David Glass, engineer, T. Leland Brown and George P. Couper.

IRRIGATION MANAGEMENT

SPECIAL PRECAUTIONS NECESSARY WITH LOW WATER-LEVEL

By RAYMOND NEBELUNG

President, Farm Bureau, Anaheim, California

FOLLOWING several unusually dry seasons, it should not be surprising if there is a general lowering of the water level in the wells throughout an irrigation district. In the neighborhood in which the writer lives, this lack of precipitation has been apparent, not only locally, but also in the mountains which form the watershed of our locality. Lakes and streams are low and the situation generally is one that calls for co-operation on the part of all irrigators in making the most possible use of all water and allowing none to be wasted or used when not necessary.

There is a certain definite amount of water that should be used for best results to the growing crop, whether it be tree or truck. More or less than this amount will cause injury to the crop or waste of water and sometimes both. The grower should have some means of determining this optimum amount.

The object of this article is principally to try and show by what means water can be conserved following dry years such as we have recently had in southern California and which periodically affect all parts of the irrigation country. We know, in our particular district, that this must be done, as figures can be presented to show that there is considerably more water being taken out of the underground basin than is being run into it. Such a condition cannot continue indefinitely, and each irrigator owes it to himself and to the entire district to do whatever is possible to save water. Merely because a grower has his own plant and can pump all the water he needs is no excuse for using more water than is necessary for the best condition of his trees. This water all comes from a common source of supply and every bit that is removed from this source leaves that much less for future use until the supply is replenished much more rapidly than it has been during the last several years.

Probably the most simple method for the grower to practice, where he wishes to make these determinations himself, is by the use of a soil auger. A five-foot auger will give him sufficient information as, except in the case of very large trees, he is not interested below four feet. This depth of irrigation will insure sufficient moisture for the average-sized mature orange trees. Usually any moisture below fiive feet will be wasted.

Before commencing an irrigation, the grower should thoroughly test out all portions of his orchard with the soil auger to determine whether there is an actual need for irrigation. If the soil feels moist to the touch and sticks to the auger, it is almost certain that there is still sufficient moisture in the soil and that it will be probably a week or more before it will be necessary to apply water. The practice of irrigating before the soil and the growing crops are in need of it is not only detrimental to the crops, but is an actual waste of water.

IF THE grower has found it necessary to irrigate, he should then know what is becoming of his moisture, that is, how deeply it is penetrating into the soil. Too much irrigation is done by guesswork, the water being run over the soil until it reaches the end of one furrow and then turned into the next ones. An auger examination following an irrigation will often show that the moisture has penetrated to only a depth of a foot or sometimes less on the heavier types of soil and to below five feet on the sandy types. This is causing injury on both types of soil, the heavier types not receiving enough moisture, and the sandy types having the soluble plant foods washed down below the feeding area. If the grower will determine the penetration following an irrigation, he can make corrections by the time he again irrigates, running the water longer on some portions and running it more rapidly and in less time over other portions. If he can get an average of a four-foot penetration on all types of soil, he will be giving his trees the irrigation that is required. This takes practice, and only by examining down to a depth of four feet can a grower know what is actually taking place.

As a means of conserving our moisture supply, the writer wishes to offer the following suggestions to users of irrigation water and irrigation companies. While these may not be in exact order of importance, still they all have a direct bearing upon the amount of water that can be saved.

The first method that should be used is to make a careful test of the soil to determine when it is necessary to irrigate, and not irrigate until that time. Following the irrigation, there should be another test made to determine the depth of penetration, so that especially on the sandy types of soil there will be no waste of water below the feeding area.

Next is the matter of length of irrigation runs. It is often found that where there is a run of over 15 trees there is a waste of water and of plant food near the pipe line. By shortening the runs to not more than 15 trees on the heavier types of soil and eight to ten trees on the sandy types a more even distribution can be obtained and the water will not be wasted below the feeding area.

THE MATTER of cover crops is also important, especially at a time of drought, in conserving the water supply. It is well known that a cover crop requires water more often than the tree crop, and if growers in this district, for instance, should experience a dry fall this year, it will mean that considerable more water will have to be used to keep this cover crop alive than will be necessary where no cover crop is being grown and water is applied only for the trees. While rather late to mention at the present time, this applies equally as much or even more so to summer cover crops, many of which can be seen growing in

various orchards at the present time. Every grower should consider seriously before planting a cover crop this fall and he may be doing a good service to his community by discing in any growing summer cover crop he may have, if he feels that it is going to require many extra irrigations.

A method of irrigating which is coming into popular favor in certain southern California districts, is of employing a qualified chemist to make analysis of the soil to determine the wilting point and the amount of available moisture and to notify the grower when his soil and trees are in need of water. In almost every instance where this system is being used, there is less water being applied than formerly and in some cases the amount is being cut in half. This means that on these groves only 50 per cent of the amount of water that was formerly used is now being used, resulting in an actual saving of this amount to the underground water system or to the irrigation companies. This decreased irrigation has also resulted in the trees being in much better condition, as too much water was being applied formerly.

A DIFFERENT method of distribution by water companies would also result in a saving of our water supply. A grower often has to take water when it is his turn in that particular run or else wait probably three weeks or longer until it will reach him in the next run. He does not need the water at the time, but knows that his trees cannot wait three weeks longer, and of the two evils he chooses the lesser one; that is, he irrigates before it is necessary. If the grower could receive the water on order, he probably would wait six or seven weeks between irrigations instead of four or five, and would save one or two irrigations during the season, which, multiplied by several thousand acres, would mean a great saving for the future in our supply of irrigation water.

While the writer does not wish to appear unduly alarmed about the water situation, still it is time that the grower who is absolutely dependent upon an adequate irrigation water supply begins to realize that he can do certain things to insure his supply for the future. Water receding in the wells can only mean one thing; that is, that the supply in the underground basin is getting lower. There is only a certain limit which water can be lifted and when the water level gets below this, some other means of bringing it to the surface will have to be found, if there should be an adequate supply left to bring to the surface. It is a matter of co-operation among all the growers and water companies and each must do his share.

Phoenix Conference is Disappointment

(*Continued from Page 16*)

"The Arizona Committee replied that it was ready to negotiate with reference to a project at Boulder Canyon or any other site provided the details with reference to that development could be worked out in a manner satisfactory to Arizona, and in the event an agreement could be arrived at, the Arizona Committee was fully prepared to urge co-operation to the fullest extent in such development.

"This statement of the position of the Arizona Committee was not acceptable to the California and Nevada delegations, and their members withdrew from the conference holding a caucus among themselves."

A JOINT statement prepared by the chairmen of the California and Nevada committees was also given out, in which it was charged that Governor Hunt's "language and manner" were responsible for the break-up of the conference.

The statement follows:

"When we came over to Arizona we were led to believe by the advance statements of Governor Hunt that this committee appointed by him was to act without any interference on his part and that it was not in any manner controlled by him but had unrestricted authority to act. When we arrived here, much to our surprise, Governor Hunt appeared with printed statements of his speech embodying his opinions and views as to the Colorado River and as to the matters which would be taken up and discussed at this meeting. He stated his views in positive langauge and in such a manner that we could see no hope of adjustment.

"The Nevada delegation had only one request to make and that was that Arizona withdraw its opposition to the construction of a dam at or near Boulder Canyon. This the Arizona delegation refused to do. All that was asked of Arizona in this respect was, that, in the event we arrived at an agreement on other matters then there should be included in that agreement, in substance, a statement that such opposition would be withdrawn.

"It is the purpose of both Nevada and California to do everything possible to expedite the development of the Colorado River. For years, this great resource has been wasted to the disadvantage of us all. We are as much interested in the development of Arizona as we are in either Nevada or California, but it is apparent from the attitude of Governor Hunt, as expressed by him in his speech, that, at least, he is not in accord with us in this particular and that such an agreement cannot be arrived at by any committee appointed by him. It is true that the Arizona committee stated that they would act independent of the Governor, but in view of the fact that it was a committee appointed by the governor and under the law must report back to the governor, which report the governor could entirely disregard, we saw no further use for discussion.

"RALPH E. SWING,
"Chairman for California.
"CHARLES P. SQUIRES,
"Chairman for Nevada."

The California delegation included: Senator Ralph Swing, Senator L. L. Dennett of Modesto, Assemblyman A. C. Finney of El Centro, and Assemblyman Walter J. Little of Hermosa Beach.

The Nevada delegation was announced as: C. P. Squires of Las Vegas, Levi Syphus of St. Thomas, George B. Cole of Carson City, state comptroller, and George W. Borden of Carson City, state highway engineer.

Editors Are Divided on Arizona's Governor

(*Continued from Page 22*)

mean is that the delays of the nearly three years that have elapsed since the federal government stood aside to let the Colorado states try to reach a plan of co-operation have become intolerable and obstructive of progress."

THE *REPUBLICAN'S* voice is not, it appears, the only one uplifted in condemnation of Governor Hunt from within his own state. More than a few newspapers consider that politics flavor such utterances as those of his Phoenix statement.

The Casa Grande (Arizona) *Bulletin,* comments: "The people are now well convinced that his idea of damming the River with his brand of politics is the bunk."

The *Five Points Star,* published at Phoenix, describes the governor as a man who "stands alone, a subject of ridicule and criticism that is growing by leaps and bounds," and the Douglas *Dispatch* says: "He has done what was expected of him." The Tucson *Citizen* remarks: "The governor's lack of the constructive faculty has never been more clearly shown."

A veritable storm of criticism is heaped upon the Arizona executive, however, from California newspapers, and the gazettes of other states, when they comment, are prevalently antagonistic. The following are characteristic comments, and they are usually enforced by

arguments that the Colorado River is not the exclusive possession of Governor Hunt nor the state of Arizona:

"Governor Hunt's attitude places him in the category of a trifler."—Anaheim, California, *Bulletin*.

"The address delivered by Governor Hunt was much more intended for Arizona consumption than for the ears of the delegates to the conference."—San Bernardino, California, *Sun*.

"Those who know Hunt were not at all surprised by the failure of the Phoenix conference."—Tustin, California, *News*.

Realtors Study Irrigation

Men who sell land were shown glimpses of the work that makes land salable when three hundred real estate men of Central California recently were the guests of the Modesto Real Estate Board on a tour of the Don Pedro and La Grange irrigation projects of the Modesto-Turlock irrigation districts.

Realtors of Stanislaus County provided automobiles in which the delegates from many parts of the state were taken over the districts. The Don Pedro dam, rising 300 feet above the bed of the river, impressed the visitors mightily as a symbol of what is being done to make western land more valuable.

Rural Population Declines

The farm population of the United States decreased approximately 182,000 during 1924, according to estimates based on a survey of 25,000 representative farms made recently by the U. S. Department of Agriculture. This is a drop of 0.6 per cent during that year, the estimated farm population on January 1, 1925, being 31,134,000, compared with 31,316,000 on January 1, 1924. This estimate includes not only the agricultural workers but all men, women, and children living on the farms on that date.

Farmers as Power-Users

The American farmer ranks next to the railroads and leads both the manufacturing and mining industries in the use of power, says *The New Reclamation Era*. Approximately 60 per cent of the power utilized on farms is animal power. Tractors account for nearly 17 per cent, motor trucks about 4 per cent, stationary engines 12.5 per cent, windmills a little more than 1 per cent, and electrical installations 5.5 per cent. The use of this power, together with labor-saving machinery, has greatly benefited the American farmer. The average farm worker now cares for approximately three times as many acres of crops as did the worker of 75 years ago.

HYDRAULIC ENGINEERING

Dealing with the Practical Problems of the Operating and the Consulting Engineer

DESIGN AND CONSTRUCTION OF SMALL EARTH DAMS

By W. H. NALDER

Engineer, U. S. Bureau of Reclamation

THE construction of an earth dam of any considerable size or one that impounds any considerable volume of water should be done with great care. The investment is great, and the risk of losing this investment and the danger of imperiling the lives and property of others in the event of the failure of a dam should be carefully considered and amply guarded against. The various States have enacted laws placing the construction and maintenance of such dams under the supervision and control of the State engineer or other authorized official, and no person should proceed with the construction or use for the storage of water of any such structure, regardless of size, without first ascertaining that he is acting fully within the laws of the State.

EARTH dams may vary in size from small canal banks to large reservoir dams, perhaps 200 feet or more in height. The factors determining their individual design are numerous and are dependent upon such variable quantities as the nature of the foundation, the climate, the materials available, and the use to be made of the reservoir created. On account of these conditions the design and construction of earth dams often require the very highest type of engineering skill, experience, and judgment. This article, however, will be limited to the nontechnical discussion of the design and construction of small dams and embankments of a type usually required for small farm reservoirs such as can readily be constructed by teams, wagons, and scrapers and without more elaborate construction equipment. The following discussion should be considered only as outlining general methods and not as being applicable to all conditions.

THE preparation of the foundation for an earth dam is of great importance. The most suitable material on which to place an earth dam is sandy or gravelly clay. However, for a farm reservoir it will generally be necessary to use whatever foundation is available and to take suitable precautions to prepare this foundation so that an economical and safe dam will result.

The first thing to be done is to remove from the entire area to be occupied by the dam all sod, brush, trees, roots, and other perishable matter and all soil to a depth equal to that penetrated by the roots. All this material should be wasted. If pockets of quicksand or clean sand are found in the foundation, these also should be removed, or special precautions taken to care for them under competent engineering advice. If the exposed material is sandy or gravelly clay of substantial depth, the embankment for small dams may be safely built directly upon it, but it should first be scored with a plow to provide a bond between the foundation and the embankment.

If solid rock is encountered in the foundation, low concrete cut-off walls should be built parallel to the top of the dam. These cut-off walls should extend at least 12 inches into the solid rock and should rise above the rock surface from 2 to 4 feet according to the height of the dam. Parallel cut-offs should be built at intervals generally not exceeding 20 feet throughout the area of the foundation that consists of solid rock.

If the foundation consists of open gravelly or sandy material that would be freely draining, an open cut-off trnch should be excavated to the more impervious underlying material and this trench filled with impervious material and made a part of the impervious portion of the main dam. Earth dams should not be built on a shale or slate foundation. If running springs are encountered in the foundation, the site should be abandoned or competent engineering advice secured before proceeding further with the work.

THE arrangement of the material in the embankment and the method of placing and compacting it will depend upon the relative quantities and kinds of material and the available moving equipment. If sandy or gravelly clay in abundant quantities is available and the height of the embankment to be built is not over 50 feet, the material may be deposited uniformly over the embankment. The material may be transported and handled with teams and scrapers or dump wagons. The material should be deposited in horizontal layers not over 1 foot thick and the travel over the embankment in placing the material should be so distributed as to secure as thorough and uniform a compacting effect as practicable. If this compacting does not produce a firm and solid embankment at all points, further compacting may be obtained by sprinkling with water and rolling with a steam or horse-drawn roller. Most farm tractors make good rollers for this purpose, or one can be made by placing an axle through several cast-iron car wheels and rigging a tongue to it so that it may be drawn by teams back and forth over the embankment. The corrugating effect of the flanges of the car wheels is especially effective in compacting moist earth. An economical corrugated roller can also be made by filling with concrete a section of corrugated metal culvert pipe about 3 feet in diameter.

It is quite often the case that the amount of sandy or gravelly clay or other available material that will form an impervious embankment is limited and insufficient to build the entire embankment. In such cases it is necessary to use this material to the best advantage and to supplement it with other material that is available in order to make a safe, stable, and water-tight dam. Under such circumstances it is often best to place the best water-tight material in a puddled core in the bdy of the embankment by sluicing or ponding methods, but it is not recommended that this be done except under skilled engineering supervision

For small embankments satisfactory results, under these circumstances, can

"The Right Way to Measure Water"

For Detailed Listings, Branch Offices, Etc., See the Buyers' Guide to Leading Supply Sources—Pages 55-56

usually be obtained by placing the selected water-tight material in the upstream portion of the dam and by constructing the downstream portion of heavy, stable, freely draining material, such as sand, gravel, and stone. Such material should be so distributed that the coarser material is on the downstream slope of the dam, changing gradually to the finer and more claylike material as the impervious material in the upstream portion of the dam is reached.

The material should be placed and compacted in a manner similar to that described for homogeneous embankments, but where heavy gravel or rock fragments are used the compacting operations may be omitted. No general rule can be laid down as to the amount of impervious material that it is necessary to use in a dam. For the type of embankment contemplated in this description the thickness of the impervious portion should be not less than one-third to one-half the horizontal thickness of the dam at any elevation.

PROPER dimensions for an earth dam depend upon a number of factors. The top width should be sufficient to form a substantial structure and generally should be wide enough to provide a suitable roadway for crossing from one side of the canyon to the other and for making repairs to maintain the dam and related structures. A top width of 8 feet is suggested as a minimum for small dikes. For dams over 20 feet in maximum height this should be increased up to about 20 feet for dams 50 feet or greater in height.

The top of the dam should be sufficiently high above the highest water surface in the reservoir to obviate all possibility of the dam being overtopped even by spray or splashing during high winds. For the very smallest reservoirs the height above high water should not be less than 2 feet and for most ordinary circumstances not less than 5 feet. For reservoirs of any considerable size and for all dams 50 feet or more in height this height should be not less than 8 to 10 feet. The minimum upstream and downstream slopes of the dam are fixed in some States by statutes. The downstream slope should be sufficiently flat to avoid weathering.

For the type of dams contemplated in this article this slope should never be steeper than 1½ horizontal to 1 vertical, even for the smallest dams, and in general should not be steeper than 2 horizontal to 1 vertical. The upstream slope should in general be flatter than the downstream slope and in general should not be steeper than 3 horizontal to 1 vertical. Unless the upstream slope is protected by some suitable pavement such as hand-placed riprap or heavy rock facing it will usually be impracticable to maintain a slope as steep as 3 horizontal to 1 vertical.

Often the most important feature of an earth dam is the spillway. No earth dam should be constructed without ample provision for the safe passage of the maximum flood that can occur with the reservoir full and without encroaching dangerously upon the freeboard of the dam. Spillways for earth dams should in general not be controlled by gates that must be operated by an attendant, but should be automatic. The detail design of spillways is affected by many considerations and each spillway must be adapted to the conditions existing at the site.

EVERY reservoir formed by an earth dam must be provided with suitable outlet works to provide for drawing off the stored water as required and for controlling the discharge from the reservoir. It is most desirable to have the outlet works independent of and apart from the dam, but for the type of earth dam contemplated, it is usually necessary to construct this outlet through its base or at best in a tunnel through one abutment.

The main consideration in outlet works for earth dams is to make them safe from danger to the dam structure. The pipe or other conduit laid through the base of an earth dam should be amply strong to withstand cracking or fracture under the heavy load of earth fill placed upon it.

The controlling gate should be placed at or near the upstream face of the dam to avoid the possibility of introducing water under pressure into the body of the dam. Ample cut-off collars should be provided to prevent percolation of the water along the outside surface of the outlet conduit, and great care should be taken in compacting the earth fill around this conduit. The water should be discharged at the outfall end in such a manner as to avoid all danger therefrom to the downstream toe of the dam.

On the whole it is believed that there is no structure usually connected with irrigation works that is so subject to varying local conditions and that requires the exercise of more care and mature judgment, to the end that economical and safe construction may be obtained, than earth dams. It is therefore believed that no such dam should be built except under the advice and supervision of a competent and experienced engineer.

Developments on the Roosevelt Water Conservation District, Arizona

(*Continued from Page 12*)

or about one-half cent per KWH up to a maximum of 416 2-3 KW for each $100,000 paid into the Assocaition to defray the actual cost of power plant. Six such equal payments are contemplated within a period of ten years time. This $600,000 total payment will give the District all its power at about one-half cent per KWH. The rate without making investment in power is about one and one-half cent per KWH.

THE JASPER-STACY Company of San Francisco are the contractors doing the construction work. Two million dollars worth of six per cent bonds have been issued and taken up by a bond syndicate. An additional million dollar issue has also recently been sold. The construction work, to date, has cost $735,000. Funds have been turned over to the Association for the canal lining, the bulk of which will be done this winter.

Reed and Baker of Phoenix, Arizona, were engineers for the District and were associated during construction with H. I. Wood, representing Fred H. Tibbetts of San Francisco, the Consulting Engineer.

The principal crops will be cotton, melons, alfalfa and maize. The northerly portion of the District will probably be devoted to the growing of citrus fruits, grapes, dates, etc. All of these products have been successfully grown in the past on the project with success where water has been available. The easy means of transportation on the paved highways adjacent to the project and the two railroad lines through the District with the rich soil should cause a rapid development which will be similar to that in the best portions of the Salt River Valley. A substantial portion is under irrigation from the wells this year and it is expected that more than half will be under irrigation next year.

San Jacinto Votes Bonds

A bond issue of $44,000 was approved by the voters of San Jacinto, California, by a vote of 186 to 16 in an election held during August. The city water system is to be practically replaced with the funds realized from the sale of the bonds. New pipe will be installed in almost every part of the system and the pumping equipment will be improved.

The Irrigation Engineer Counts the Pennies

(*Continued from Page 18*)

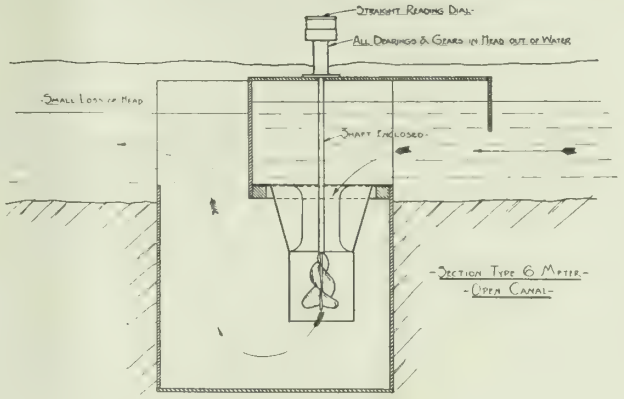
The power bill for lifting one acre foot of water one foot, net height, should be about 2½ cents while the combined amoritzation and operating charges should be less than 8 cents. This indicates an annual cost per acre of about $5.00 when lifting water 25 feet. The recent California State Bulletin by Harry F. Blaney, summarized by Mr. Blaney in the August number of MODERN IRRIGATION, shows the extent to which the average pumping plant exceeds this figure. While the efficiency at the pump may be as high as 75 per cent, the overall efficiency seldom exceeds 50 per cent, which means high annual power bills. These extra losses are usually "velocity head" losses which may often be reduced by foresight in designing the pipe connections.

Economic selection as regards open channels is not generally as simple as has been shown here in pipe and pump design, but an analysis can be made to determine the benefits to accrue between the use of flat, low velocity canals and steep, swifter ones. In the former we have more land served, on the latter smaller cross-sections and lower first cost.

THE CROSS-SECTION for a known grade also admits analysis. The "best discharging" section is the one whose "ideal" sides and bottom are tangent to the circle drawn about the middle point of the water line as a center. It is rather deep but will deliver more water for equal area of cross section, bank slope and water slope than any other section. Due to its depth the unit costs may be higher, but for a required capacity the yardage is less, less area is exposed to evaporation and the velocity is higher, allowing the water to arrive at the land more quickly and reducing seepage losses. For lined canals or flumes this section is ideal as it also reduces first cost, due to its shorter perimeter.

In the location of field ditches economics enter in several ways. Later subdivision should not require expensive ditch relocation. If possible, the spacing of the laterals should be parallel to tree rows and multiples of tree space distances, to avoid lost tree spaces, since each tree lost to an orchardist means the lost income from an equivalent investment of many dollars.

THE **RELIANCE** METER



Straight Reading Dial
All Bearings & Gears in Head out of Water
Small Loss of Head
Shaft Enclosed
Section Type G Meter
Open Canal

THE RELIANCE IRRIGATION METER has been the standard low pressure Meter for 10 years—thousands installed throughout the irrigated sections of the West. Built in various types and sizes to fit all deliveries on canal and pipe systems. Easy to install—easy to read. Straight reading cubic foot or acre foot dials. Simple in construction, few and slow moving parts—upkeep negligible. No bearings or gears under water—small loss of head. Unaffected by dirt and floating debris in water. There is a size and type to settle your measurement problem.

California Public Utility Water Systems Now Number 500

Year 1924-25 Sees Increase in Spite of Many Consolidations; 1924 Was Difficult Year

Public utility water systems in California increased during the fiscal year ending June 30, 1925, from 450 to 500, despite the fact that there were many consolidations of private systems and a large number were taken over by municipalities, according to the recent report of the Hydraulic Division of the Department of Engineering of the Railroad Commission.

During the last fiscal year the Commission rendered 134 decisions involving water utilities, which were investigated and reported on by the Hydraulic Division. In addition to these, 46 decisions were rendered by the Commission relating to security issues of water companies.

Due to the efforts of the Hydraulic Division the operation of water utilities was conducted during the serious drought of last summer with a minimum of damage and loss to both property owners and the water companies.

Although the rainfall last winter was not up to normal in the southern part of the state, conditions are much improved this year. Conditions north of the Tehachapi are much improved, and pro rating of the use of water will not be required in this section of the state so extensively as may be required in the territory south of the Tehachapi, says the report.

Valuations and rate proceedings involving valuations of public utility water property to the amount of $5,142,497.00 were handled by the Hydraulic Division during the last fiscal year. Informal complaints involving water utilities to the number of 784 were handled by the Commission during the fiscal year. These involved 153 field investigations.

The Hydraulic Division also investigated plans and checked the work for the following important dam construction projects: Lake Almanor dam of Great Western Power Company; Florence Lake Multiple Arch Dam of Southern California Edison Company; concrete arch dam on James Creek for Central Mendocino County Power Company; concrete arch dam on Klamath River for California-Oregon Power Company; hydraulic filled dam on San Leandro Creek for East Bay Water Company; concrete dam on Pit River Development No. 3 for Mt. Shasta Power Corporation, a division of Pacific Gas and Electric Company.

Water Works Engineers to Meet at Santa Cruz

California Section of American Water Works Association Convenes for Three-Day Session October 15

October 15, 16 and 17 will see the water works engineers of California in session in the annual convention of the California Section of the American Water Works Association. This year the meetings are to be held in the Casa Del Rey Hotel, Santa Cruz.

The California chapter of the American Association now has a membership of about 125, a large percentage of whom are expected to be present at the October sessions.

There will be more space for exhibits than has been obtainable in past years, and the Exhibitors Committee, under the chairmanship of R. W. Martindale, has sent out invitations to a selected group of manufacturers who will be accorded the privilege setting up exhibits of an educational nature for the inspection of the engineers.

George W. Pracy is President of the California Section; C. B. Jackson, vice president; and S. B. Morris, secretary; with P. Diederich and John Burt as the two additional members of the Executive Committee.

Stock Issue Authorized

The Santa Paula Water Works has been authorized by the California Railroad Commission to issue, at not less than par, $123,200 face value of unsecured promissory notes, payable at not more than three years after date, with interest at not exceeding seven per cent per annum, for the purpose of paying notes now outstanding.

New York Looks Ahead to 7,000,000 Population

Water Problems of a Decade Hence Are Causing Grave Concern to Nation's Metropolis

That the question of future water supply is not merely a problem of the west, but of many districts of the east as well, especially in relation to an assured continuance of adequate supplies for domestic and industrial uses in the great metropolitan centers, is indicated by the questionings that are shaking the heart of New York City, which is looking forward to a population of seven million within a decade, and wonders where the water is coming from.

The present provisions which the city has made to protect itself against any possible water famine will last, says the *Scientific American,* in a recent number, at the present rate of population increase, until the year 1935, "but at that time the use of water will exceed the safe yield of the then existing sources of supply. A conservative estimate by the Board of Water Supply places the population of this city ten years from now at 7,600,000 people. The rate of consumption is 135 gallons per capita per day; it is slightly increasing.

"Prudence demands that the city at once take preliminary steps to secure a water supply additional to the 1,036,000,000 gallons now available. New sources of supply of excellent drinking water can be provided on the west side of the Hudson by raising another dam on the lower Schoharie and by the development of Catskill Creek. This would provide an additional 500,000,000 gallons per day; and a development of the streams in Dutchess, Columbia and Rensselaer Counties on the east side of the river, would yield another 350,000,000 gallons.

"When the city has grown to the extent predicted, it must fall back upon the great catchment basin of the Delaware River. An equitable apportionment of the waters of this great river is being sought in a compact between the three states concerned, by which New York will be assured of 1,500,000 gallons per day of water of the same quality

as that of the Catskill system. New Jersey will secure the same quantity, and Pennsylvania will have at its disposal 3,000,000,000 gallons, which it can use at such time and in such quantities as its various cities may require. The compact merely defines the rights of the states and it should receive the unanimous support of the three legislatures concerned."

Palo Verde Bonds Voted

A special election called by the Palo Verde, California, Irrigation District, on the issuance of $3,287,000 in bonds, was held late in August and resulted in an overwhelming victory for the proposition.

The bonds will be issued to provide funds for the acquisition of water rights and system of the Palo Verde Mutual Water Company, to pay outstanding bonds, for the strengthening and extending of present levees along the Colorado River and for other protection work, and for the purpose of enlarging the water distributing system, constructing drainage canals, nad necessary surveys.

The bonds will be in three issues, installments being due from 1937 to 1955.

Balloting was on the basis of assessed valuation of real estate and improvements, included in the irrigation district, one vote being allowed for each $100 assessed valuation or fraction thereof greater than $50. Large holdings were totaled, and the assessed valuation divided by 100, the resulting quotient being the number of votes cast by such individual or company.

The Palo Verde Irrigation District was formed by the consolidation of the Palo Verde Joint Levee District, the Palo Verde Mutual Water Company, and the Palo Verde Drainage District, under a special act of the California state legislature, passed June 21, 1923. This legislation act also made provision for the special plan of voting which was followed.

Company Faces Problems

Water companies of Banning and Hemet, Calif., are faced with difficult problems as the consequence of a long "dry year." The Banning Water Company is operating four pumping wells, and is cleaning and deepening the big well at the Bigley Canyon gate. The wells are electrically operated. The heads of water available are much smaller than for previous years. Many new wells have been sunk in the Hemet district, lifting the water 200-300 feet in many cases.

Bissell Writes on Forest Problems

(Continued from Page 19)

If it matters, let some one else put the fire out. If it must be protected, let the Forest Service do it—that is what they are for! As long as this attitude is held by a large part of the people the situation is well nigh hopeless. They must be made to see and to know.

FORTUNATELY, some of us in the State of California, are alive to the necessity and have formed an organization whose object is the conservation of our forest resources—The Conservation Association of Southern California. It is a clearing house through which all constructive effort can be cleared. The most serious and pressing problem that faces Southern California today, and one which other parts of the west are meeting in one form or another, is a more adequate and dependable supply of water and the protection of our valleys from floods. Problems of such magnitude can only be solved by the united effort of all classes of interests. They are the problems of the rancher, the business man and citizens at large. Our growth and permanence will be in direct ratio to our success in their solution.

It is indeed strange that up to this time a subject that so directly affects not only our prosperity, but our very existence, has received only the sporadic attention of uncorrelated groups.

Due to this lack of united and sustained effort, our mountain watershed is being destroyed acre by acre and year by year. The Conservation Association of Southern California is the result of three or four years of cumulative effort and combination, until now most of the constructive thought along this line is directed through one channel.

A foundation is being laid on basic lines, the results of which will become more and more tangible and concrete as the organization grows in members and in strength. This Association invites the co-operation of Chambers of Commerce, business organizations, municipalities, service clubs and all organizations and individuals that believe that all agencies and interests have a common ground and can work together on a program of basic principles on which we can stand united. When this is achieved, success is assured.

Commission Grants Extension

The California Railroad Commission has granted an extension of time until December 31, 1925, within which Ed Fletcher may sell the Cuyamaca Water Company to the La Mesa, Lemon Grove and Spring Valley Irrigation District, located in San Diego county.

WHO'S *WHO* AND WHO'S *WHERE*

IN IRRIGATION AND RECLAMATION

Personal Notes and Impersonal Observations About Men You Know

W. O. Blair, director of the Imperial Irrigation District, and A. L. Graves, master mechanic, have been authorized by the district to make a trip to the east for the purchase of machinery for the Imperial District's shops.

J. R. Mason and J. D. Neale, of San Francisco, of the J. R. Mason Company, irrigation security specialists, were members of a party of prominent irrigationists who inspected the Tumalo irrigation project during August.

Hervey Lindley, of Seattle, was reelected as president of the Columbia Basin Irrigation League at the recent meeting of its Board of Directors. Francis M. Goodwin, of Seattle, formerly assistant Secretary of the Interior, was chosen as the Washington (D. C.) representative of the league.

H. A. Van Norman, formerly city engineer of Los Angeles, resigned that office during August to become assistant general manager of the city water department, as assistant to William Mulholland. John C. Shaw was appointed city engineer succeeding Mr. Van Norman.

M. J. Dowd, recently appointed general manager of the Imperial Irrigation District, has been named general manager for the Compania de Terrenos y Agua de la Baja California. This appointment as managing head of the Mexican company enables the Imperial executive to take control of the district's interests below the Mexican border.

J. E. Haley, Jr., of the California state engineer's office, made a recent trip of inspection to the Imperial Valley for the purpose of examining the accounting system in use by the Imperial Irrigation District. The state engineering department is interested in the system, says Mr. Haley, and is considering recommending its adoption by other irrigation districts of the state.

O. E. Meinzer, chief of the ground water division of the United States Geological Survey, is in southern California after three months spent in Arizona and along the Colorado River. Mr. Meinzer will make water surveys in the southern California region, notably at Camp Kearney, near San Diego, where the government is said to be contemplating the establishment of an air base.

Mrs. Nellie Taylor Ross, Governor of Wyoming; Clarence J. Morely, Governor of Colorado; and George Dern, Governor of Utah, meeting in a two-day conference late in August, issued a statement calling on representatives of those three states in Congress to oppose any development of the Colorado River by lower basin states until the rights of the upper-basin states had been fully protected.

Governor Pierce of Oregon and members of the state securities commission were recently the guests of directors of the Tumalo Irrigation District, on an official visit made to determine whether the state will guarantee interest on the Tumalo irrigation district bonds for the next two years. Directors of the district are E. M. Wright, C. H. Hatch, and W. R. Gerkins. D. J. McClelland is project manager.

Boulder canyon and the Swing-Johnson bill will probably be a vital issue of the forthcoming campaign for United States senator from California. Robert M. Clarke, president of the California Bar Association and senatorial candidate, speaking at a Labor Day Celebration at Los Angeles, opened his campaign with a vigorous statement championing the Swing-Johnson measure and the All-American canal.

E. E. Blake, chairman of the Irrigation Commission of Oklahoma, A. S. Stinett, Irrigation Commissioner of Texas, A. Lincoln Fellowes, engineer of the Department of Agriculture, with R. J. Freeland, J. A. Dykes, and Albert Calisch, Irrigation Commissioners of New Mexico, in a conference at Tucumcari, N. M., in August, discussed irrigation developments of mutual interest to the three states. The party of irrigation officials made a trip of inspection of various dam sites along the Canadian River in New Mexico.

R. A. Thompson, of the firm of Nagle & Thompson, consulting engineers, of Dallas, Texas, has recently formed a consulting partnership with H. G. Butler, former Power Administrator for California, with offices at 216 Pine Street, San Francisco. Mr. Thompson was formerly chief engineer of the California Railroad Commission. Nagle & Thompson, with whom he is associated in Dallas, are the engineers in charge of the construction of the $3,500,000 Garza Dam for the city of Dallas.

A. L. Sonderegger, well known engineer of Los Angeles, has been named by Riverside County as its representative on a board of three experts, representing Riverside, Orange and San Bernardino Counteis, respectively, in a survey of the Santa Ana River and to advise with the office of the state engineer of California in the determination of work to be done for the conservation of its water supply. George Hinckly, of Redlands, representing San Bernardino County, and J. B. Lippincott, Los Angeles, representing Orange County, are the other two members of the committee.

Senators and Congressmen of Oregon, with state officials and prominent irrigationists of the state, were guests of honor at a Congressional Banquet held in August at Madras, Oregon. Senators Robert N. Stanfield and Charles L. McNary, Oregon's representatives in the United States senate, and M. E. Crumpacker, N. J. Sinnott, W. C. Hawley, and Denton G. Burdick, members of the House of Representatives, were among the speakers. Rhea Luper, state engineer, and H. M. Chadwick, assistant, gave short talks. Dedication to the development of Oregon through irrigation was the dominant note of the banquet.

New Home of PEERLESS Pumps

We build Turbine Pumps for general irrigation and for municipal and industrial use.

The new plant of the PEERLESS PUMP COMPANY occupies two acres of ground at 1902 East 67th Street, Los Angeles. It is modern in every respect, including commodious offices for the company and factory facilities for greatly increased production of PEERLESS PUMPS, made necessary by a rapidly growing trade. Not only is the work of making PEERLESS PUMPS greatly facilitated in the new factory, but every detail of our advisory service and the prompt and efficient filling of orders is now better accomplished. You are cordially invited to call and inspect the new plant.

RECLAMATION

A DEDICATION TO A BROAD POLICY OF CONSERVATION

By HUBERT WORK

Secretary, U. S. Department of the Interior

HUBERT WORK is the official head of that department of the government most directly concerned with irrigation, and as such, is listened to with interest, if not with uniform approval, whenever he declares the policy of his department with relation to reclamation and conservation. The accompanying article is a reproduction, in part, of his address at the recent celebration at American Falls, Idaho, when construction was begun on the great American Falls Reservoir.

FOR three centuries we have been an exploiting people. We have seized on the great natural resources of the country and put them to individual use which was too often wasteful and destructive. This has created a kind of thinking and a kind of organization which makes it difficult for people to realize the necessity or importance of organizing our future development along the lines of permanence or economy.

Economy is simply a factor in the larger question of conservation. Necessity is the mother of invention, and new conditions call for new remedies. As a people and a nation we have completed an epoch of free utilization of our natural resources, but we now stand on the threshold of a new era which, if we are to adapt ourselves to future conditions, makes it necessary for us to direct our thoughts and acts toward thrift.

FIFTEEN years ago the country was disturbed by a wordy war between extremists, discussing conservation. The line of dissension was drawn between those in the East which had already cut its timber, had seen the rapid depletion of its limited oil deposits and was abandoning exhausted farms and those in the West, where the land's fertility had been demonstrated, where the great forests were yet untouchd and the mineral deposits were described as inexhaustible.

The East sought to lock up through legislation the wealth of the West for use of succeeding generations. The pioneer, believing that the richness of the West was his by right of discovery, and access to it had been earned by the hardships incident to developing a new country, resented what he called strong armed action of the majority of numbers.

Policies were used to propagate personal attacks among administrators, and bitterness developed between employees of different Departments of the Government that only within the last four years has begun to subside.

ALL OF THIS was unfortunate and wholly unnecessary. Like a forest fire it swept the West but left smoldering embers easily fanned into flames of reprisal and ever since has affected the political destiny of many men.

A line of divergence or dissociation of interests between the East and the West, or the North and the South, in these United States is no longer tolerable. All points have a common responsibility, a common interest in ultimate results, and a diversity of resources for common use.

The conservation of the soil's fertility is vital to life. It produces our food, but the conservation of every incidental to the whole scheme of living should be associated. The most pressing study of the Government, and one in which I know the greatest minds in this country could be enlisted, is this larger conception of conservation. While it is too big for any one branch of the Government alone, to develop in its fullness in time to meeting pressing exigencies, nevertheless it should have centralized Departmental authority. The Government would then have a correlating nucleus for forming about it wealthy men who now stand ready to help, an organized movement to accomplish something worth while of national scope looking into the future, in the interests of those who are to follow us.

The farmer's place in conservation is fundamental, for all branches of human industry eventually trace back to the farm. No other single product compares in value to the farm crop. Older nations have gone blindly on and exhausted their soils of that inherent fertility, stored up through millions of years of sunshine, rains and decaying vegetation. Now their soil serves only as a base and must be fed each year with its food to produce human food, the sun and rain and labor supplementing the fertilizer in the soil. The same processes are being adopted in the Eastern United States. The West has this priceless inherent asset of the soil and should preserve it, for it is fundamental to its moral, social, and economic integrity.

The new conservation idea means intelligently utilizing what we have rather than abandoning it for new resources. Through the wanton destruction of bird life, scientists tell us we have multiplied insect life by millions of folds; we are told that last year American farmers lost eight hundred millions of dollars by insects. This damage to crops by insects in a single year exceeds any possible inroad by the hand of man on our national resources during a like period and is far greater than the cost of all the reclamation projects in the United States. The chestnut bark disease, first noted near New York City in 1904, quickly extended its blight over large areas and brought destruction to a profitable product of the forests. Storms, frost, and other natural phenomena also take their toll from the American farmer.

SOME of these enemies of conservation which exemplify Nature's continuous process of waste and repair will eventually yield to scientific agriculture, but in the meantime we must study to overcome loss from causes we can understand.

Through the process of artificial selection we have increased the value of vegetables and even produced new types. We use and at the same time conserve our domestic animals through pure bred

Here Are Pictures Showing What The Ruth Super Crawler Dredger Actually Does

The picture on the left above shows conditions that the usual dredger cannot hope to cope with, at Mitchell, Nebraska. The upper picture on the right shows the clean-cut ditch made by The Ruth Super Crawler Dredger. You will note in the picture the Ruth is still going through without any stoppage by growths of any kind, and it will be readily seen The Ruth Super Crawler Dredger works equally well in water as in dry earth, 'dobe or clay.

The Ruth Super Crawler Dredger Is Essential for the Economic Upkeep on All Reclamation Work.

sires; we ingraft fecund branches on sturdy trunks that have become exhausted from age and long bearing; we diversify our crops to rest the land and raise crops to plow under to feed the soil. We have been working to increase the total yield rather than to improve the quality of the crop. The exacting demands of the consumer will in time correct this.

People, like animals, are found in greatest numbers where food is easiest to obtain. They, too, are gregarious. Our rapidly growing population and citizenship must be provided for in advance. We should locate its necessities and conserve that which cannot be reproduced. It is said that 38,000,000 acres more will be needed for crops in 1955, with no increase in our imports, to feed the normal increased population.

Exhaustion of the soil's fertility was not stressed in the conservation policy of the past. It advised the cutting of the ripe timber which destroyed much that was growing. It compelled drilling for oil if a neighbor found it, and did not warn against exhausting the soil by tenantry which treatens to cover the West, like the East, with abandoned farms and make of us a manufacturing, rather than an agricultural people, and in some old States has made impossible the growing of sturdy children on farms. It takes 90 days to grow a crop of corn, 21 years to grow a crop of children, and a hundred years to grow a forest. One million boys and one million girls reach 21 years annually. The growing of these young people is a national responsibility. Their education is of importance, but their intelligence is vital to the safety of this nation.

WE CANNOT regard Federal Reclamation as of local importance only. Whether this semi-arid region shall continue to support itself, our Western coast, and load their ships outbound, or revert to sparsely settled range conditions, to be fed by the Middle West, is a national question and an outstanding feature of conservation, as the country must be made to understand it, to be secure in its position as supreme among nations.

Our reclamation projects, which are of engrossing concern to me, have 6,609 unoccupied farms of varying size, or 564,000 acres. More than 14,000 potential farms of 40 acres each. How we can put farmers on this land who will produce foodstuffs in lieu of what we are importing is our big problem.

We are consulting Western Representatives in Congress, Governors of States, and editors. The latter have the keenest and at the same time the most independent judgment on local situations, and we travel with railroad managers whenever possible, the purpose being to enlist all of them in this common cause. Our older reclamation projects are being mined of their fertility by tenants, precisely as the East has been. Why not at least preserve this virgin fertility as an inducement, to get and hold people on these projects and to build up thoroughly American communities? The United States last year imported about $425,000,000 worth of crude foodstuffs and food animals, exclusive of wool and cotton. *It is idle to change our production of farm products and limit them to compel higher prices until we are producing more than we consume.*

But back of it all is the greater question of conserving the American people. We should not exploit men and women to open up new regions. We can not exhaust natural sources of food supply and weaken the race. We can not pass on blindly to a point where one season's drought would put a prosperous nation in want. The fertility of our soil must be conserved or restored when lost, or our boasted civilization will fail. When the lime has left the land and has been deposited in men's arteries, the end is not far off. We are in time to forfend this situation. The hope of our country is in the virile Americanism of the West, in its people, its soil, its minerals, and in its vision.

What the Imperial Irrigation District Is Trying to Do

(Continued from Page 13)

and out of the shop and current work was being taken care of promptly. I have reduced the shop force from 69 men to 41 men on August 1, 1925, and am finding no difficulty in keeping pace with the work."

In September, 1924, the District Board re-established a $5.00 assessment rate, notwithstanding the fact that the chief engineer brought in a proposed budget that would have required nearly $2.00 per acre added assessment. He was instructed to revise his estimates and to eliminate several items held to be unnecessary at this time. The Board held that it is better to reduce expenditures to a minimum than to attempt to burden the tax payers with added assessments at this time.

With more than half the present year over, the judgment of the Board has been found sound, and the entire District organization is working in closer harmony than ever before with a greater degree of efficiency, and well within the revised budget.

IN OUTLINE the system now being worked out calls for a general superintendent, responsible directly to the Board of Directors; a purchasing agent, responsible to the Board and having complete charge of all purchases; a master-mechanic, responsible to the Board; and division superintendents over each division.

The purchasing agent has been instructed to reduce the stock heretofore carried in great quantities, to a minimum. He is required to keep accurate check of all materials at all times.

The master mechanic is instructed to handle all repair work on machinery rather than send it to outside shops. He has already made some remarkable savings in that way.

In short, the Directors are in the act of putting the District on a thoroughly business-like basis, with the responsibilities of each department fixed definitely and the functions of each specifically outlined.

With more than 2,000 miles of canals and laterals, with a $2,500,000 drainage system now practically complete, and with a payroll of approximately 1,200 employees, there must be some careful planning, and the laws of the state of California have made it the duty of the District Board to do that planning. The fact that the source of the water supply of the Imperial Valley happens to be the Colorado River, and that the intake canal now runs for nearly 60 miles through Mexico before it delivers water to the District, coupled with the fact that this same Colorado River is the object of a great scramble among a number of private and state and national interests, has for the moment thrown the spotlight of publicity upon the Imperial Irrigation District administration so that reports of every conceivable nature are sent out; but that does not alter the duties of the Board of Directors of this District. By his oath of office, every Director is pledged to secure the District's supply of water, maintain the system and protect the assessment payer. If the carrying out of that obligation requires the Board to deal with foreign governments, national and state governments, that is an incident. If the Board finds that the best interests of the District require a reorganization move to cut down costs, that is an incident. The duties of the Directors are plain, and they must be fulfilled without regard for personal feelings or special interests.

Carberry's Dismissal Evokes Interesting Comment

Imperial District's Action Brings Letter from State Engineer Urging Adequate "Technical Assistance"

Interest has been aroused throughout the irrigation country by the action of the Board of Directors of the Imperial Irrigation District in requesting the resignation of Ray S. Carberry, chief engineer. The board's own explanation of its action was that the office of chief engineer might well be abolished in the interests of "economy", but observers who are unsympathetic to the board have interpreted it in various ways.

An official comment on Mr. Carberry's resignation was made by W. F. McClure, State Engineer of California, writing as a representative of the Bond Certification Commission, in a letter addressed to the Directors, with which was enclosed a copy of a letter written by him to Mr. Carberry.

The two letters follow:

Board of Directors,
Imperial Irrigation District,
Calexico, California.
Subject: Chief Engineer.
Dear Sirs:

I regret to learn, through a letter from Mr. Carberry, that his services are to be dispensed with beginning August 1st, and please take this as an expression from the Bond Certification Commission that we shall expect your splendid project to employ such technical assistance as is commensurate with the various and intricate problems presented in the matter of serving Imperial Valley with irrigating water.

Enclosed herewith copy of letter going to Mr. Carberry.

Very truly yours,
(Signed) W. F. McCLURE,
State Engineer.

To Mr. Carberry, Mr. McClure wrote:

Dear Mr. Carberry:

Am just in possession of yours of July 28th, together with copy of resolution adopted by the Board of Directors of the Imperial Irrigation District on July 23rd, requesting your resignation as Chief Engineer of the District.

Also have copy of communication addressed to yourself by Mr. McIver, Secretary of the District. setting forth the judgment of the Board of Directors that in its judgment it is "for the best interests of this District to abolish the office of Chief Engineer."

I do not know your successor nor what the Board of Directors may have in mind other than their claim for economy, but I speak for the California Bond Certification Commission when I state that if the Board employs a man with a lack of technical ability such as you possess it will make a mistake and the District will suffer.

Thank you kindly for expressions of appreciation of the consideration given you from this office and permit me here to state that such expressions are heartily reciprocated as we have always been graciously received by yourself and associates and every request lodged with you has been cheerfully and promptly acceded to.

May your future be bright!

W. F. McCLURE,
State Engineer.

Wyoming Leads in Sale of Public Lands

Federal Reclamation Fund Increased $158,429.53 In First Quarter Ended June 30, 1925

The Reclamation Fund of the federal government was increased $158,429.53 through receipts from the sale of public lands including fees and commissions for the quarter ended June 30, 1925, the Interior Department has announced.

The largest receipts for the fund came from the State of Wyoming, the amount being $22,916.06. The second largest receipts were from California, with $22,500.79, while the third were from New Mexico, with $19,756.41. The State with the smallest receipts was Kansas, with $34.24. A list of the States with proceeds from the sale of public lands credited to the Reclamation Fund follows:

Arizona	$12,025.49
California	22,500.79
Colorado	17,889.11
Idaho	9,923.88
Kansas	34.24
Montana	13,489.40
Nebraska	4,668.12
Nevada	5,917.21
New Mexico	19,756.41
North Dakota	581.27
Oklahoma	1,024.74
Oregon	12,501.45
South Dakota	2,559.81
Utah	8,178.19
Washington	4,463.36
Wyoming	22,916.06

IRRIGATION FINANCE

HOW THE IRRIGATION LAW PROTECTS THE BOND-HOLDER

By S. M. HASKINS

THE RAPID expansion of the irrigation area in California during the last decade has been made possible through the organization of Irrigation Districts under the State Law, commonly known as the "Wright Act." Originally passed in 1887, this Act has gone through an evolutionary process of improvement. Each succeeding legislature has passed amendments of more or less importance. The fundamental objections to the Act were not overcome until 1897. Radical changes were made at that time in the procedure for organizing the districts and the incurring of district indebtedness.

As expressed in its title, the California Irrigation District Act, as it is now called, is an Act to provide for the organization and government of irrigation districts, and to provide for the acquisition and construction thereby of works for the irrigation of the lands embraced within such districts, and, also, to provide for the distribution of water for irrigation purposes.

A California Irrigation District is a political subdivision of the State, quasi-municipal in character, with power to irrigate and drain lands in the District, and to develop and distribute hydro-electric power.

In California at the present time there are about ninety-six active irrigation districts of the type under consideration. These districts comprise an area of 4,000,000 acres. This is about two-thirds of the entire area under irrigation in California. The great bulk of this development has occurred since provisions were made by state law for state supervision in organization, construction and financing of the projects.

THESE irrigation districts are organized in much the same manner as school and all special assessment districts. In the matter of organization, the law has placed the following safeguards:

1. The districts are organized upon petition of a majority in title representing a majority in value of the landholders within the area of the contemplated district. Or there is an optional plan of a petition by five hundred electors or landholders within any contemplated district, providing these five hundred petitioners represent twenty per cent of the value of the land within the proposed district.

2. The Board of Supervisors of the County wherein the district is located refers the matter to the State Engineer, who through the State Department of Public Works passes upon the feasibility of the entire project.

THE California Irrigation District Act, popularly referred to as the Wright Act, is a constructive piece of legislation that has meant much to irrigation in California. The accompanying article will be of interest not only to investors and potential investors in the irrigation securities of that state, but also to irrigationists in those parts of the west not so favorably situated in regard to state legislation designed to encourage irrigation. Mr. Haskins, who has written this discussion, is a member of the legal firm of Gibson, Dunn and Crutcher, Los Angeles.

IN THE MATTER of the issuance of bonds, the interests of the bondholders are further safeguarded as follows:

1. By a special act of the California Legislature there has been created a Bond Certificate Commission, composed of the Superintendent of Banks, the State Engineer, and the Attorney General. It is the duty of this Commission to pass upon all bond issues submitted to them for certification as legal investments for banks and insurance companies, and as security for public deposits. At the request of this Commission the State Controller will certify irrigation district bonds as legal investments for all trust funds, and for the funds of all insurance companies, banks, both commercial and savings, and trust companies, and as security for public money deposits. If bonds are so certified, the law places further safeguards:

(a) No expenditure shall be made by the district without the schedule for the same being approved by the Commission.

(b) During the progress of any work to be paid for from the proceeds of any bond issue certified by the Commission, the Department of Engineering on behalf of the Commission shall make from time to time, at the expense of the district, such inspection of the work as may be necessary to enable said Department to know that the plans approved by the Commission are being carried out with no material modification.

2. The Act creating this Bond Certification Commission also places a practical *debt* limit on irrigation districts. Before certifying, the Commission passes upon the supply of water, nature of the soil, including its fertility, as well as the feasibility of the project. But in addition it ascertains a reasonable market value of the water, water rights, canals, reservoirs, etc., as well as the market value of the land within the district. Now if the aggregate amount of the bonds, including those to be issued, does not exceed *sixty per cent* of the aggregate market value of the lands within said district and of the water, water rights, canals, reservoirs and irrigation works, the bonds are eligible and may be certified. From the above it is evident that no irrigation bond can be certified as a legal investment or security for public deposits if the debt of the district exceeds sixty per cent of the value of the district and its irrigation system.

3. The law in dealing with the question of the bond election specifically states that no information in conducting such an election shall invalidate the same if the election shall have been otherwise fairly conducted. By court interpreta-

tion this would no doubt apply throughout the Act as representing the spirit in which the Act was framed and would seem to remove the hazard of illegality.

4. In the estimate of the amount of money necessary to be raised by the first issue of bonds of any district, the Board of Directors may include a sum sufficient to pay the interest on all of such bonds for three years or less. With municipal bonds, taxation is the machinery through which the bondholder receives his principal and interest. It is, therefore, important that we analyze the provisions of the Act in this respect. All the expenses of the district, including the interest and principal of the bonds, are paid by the levying of assessments on the land in the district. Such assessment is not against benefits, but is an ad valorem tax. These bonds are general district obligations, no land in the district can be released from the lien thereof until the last bond has been paid in principal and interest. Improvements on any lands or town lots within such districts shall be exempt from taxation for any of the purposes mentioned in the Act. The Board of Directors sits as a Board of Equalization. Directors may at their discretion add one per cent of the total assessed value to the assessment for sinking fund purposes, or to be used in retiring bonds.

THE LAW specifically takes care of any failure on the part of the public officials to perform their duties by providing that if the Board of Directors of the district refuses or neglects to make such an assessment and levy, then the duly equalized assessment made by the County Assessor of the county within which the district is located shall be made the basis of the assessment of the district. And the law further provides that the Board of Supervisors of the county *shall* cause an assessment roll of the district to be prepared. In other words, if the Board of Directors does not act in preparing the assessment roll and levying the assessment, the Board of Supervisors must step in and perform the duties of the Board of Directors.

In case the Collector or Treasurer of any district refuses to perform the duties imposed upon him by the law, then the County Tax Collector and the County Treasurer *must* perform such duties and shall be accountable under their official bond for so doing.

The law also recites the specific duties of the District Attorney of the county in such cases of non-performance of duty. It shall be the duty of the District Attorney of each county in which the district is located to ascertain whether or not such duties are being performed. If the Board of Directors or any official has neglected or refused to perform any of the duties in question, the District Attorney must notify the County Board of Supervisors, or the other county officials concerned, or both. Unless the Board of Supervisors or the County official proceeds within thirty days to the performance of these duties, the District Attorney *shall* take whatever action in court may be necessary to compel performance. In the event that the District Attorney fails to do this, the law provides that the Attorney General of the State will take such measures as may be necessary to enforce the performance of the duties relating to the levying and collection of assessments as in this Act provided.

A writ of mandamus will also lie against the Attorney General and other officials to compel the performance of their duties as placed upon them by law.

Because of these remedies in the event of the failure of the officials to act, the law is much stronger and better in the case of irrigation district bonds than it is in general county and city municipal obligations.

However, an assessment made must be paid and our next task is to ascertain the remedies the law provides in case of failure to collect this assessment. The assessment upon the land is a lien against the property assessed, from and after the first Monday in March for any year. Assessments become delinquent at six o'clock on the last Monday of December, and, unless paid, ten per cent is added to the amount thereof.

On or before the first day of February, the Collector must publish the delinquent list. The publication must designate the time and place of sale. The time of sale must not be less than 21 nor more than 28 days from the first publication of the delinquent list. The property is sold for the amount of the delinquent taxes and charges, including penalties. The title so acquired is subject to the right of redemption, but with this contingency the title may be conveyed by deed. A certificate of sale is made out at these tax sales and filed with the County Recorder and after such filing the lien of the assessments vests with the purchaser and is only divested by the payment to him, or to the Collector, for his use, of the purchase money and two per cent per month from the day of sale until redemption.

REDEMPTION of the property sold may be made by the owner or any party interested within three years from the date of purchase, or at any time thereafter before the final deed has been made and delivered. If the property is not redeemed within the time

herein provided, the Collector upon demand must make to the purchaser or his assignee, a deed to the property. Such deed conveys to the grantee the absolute title to the lands.

The Board of Directors may, at any time after any assessment has become delinquent, direct the Collector not to proceed with the sale of any property, but to bring suit against the delinquent taxpayer in the proper court in the name of the district and enforce collection.

The provisions of this section would seem to give a double remedy in the case of financially responsible persons. In other words, the land may either be sold for taxes or recovery of the taxes made by direct suit.

Irrigation bonds are not subject to any California State Tax and not to any Federal Income Tax. Individuals are not required to declare ownership to the Federal Government.

This completes an explanation of those sections which vitally affect the safety of the bonds of these districts. It seems that all necessary legal safeguards have been thrown around such obligations and that under the workings of the law these bonds are safe as the future of the land against which they are a lien. The failure to realize from the bonds would mean that all the property within the district could not be liquidated for the amount of the bond issue. This is the implication from the act. If the bondholder has satisfied himself as to the value of the district up to the amount of bonds issued, he need have no fear as to the ultimate payment of his obligation.

Prominent Irrigationists Serve on Board of Editorial Advisors

(Continued from Page 14)

position with the Commonwealth Power Company, now the Consumers Power Company, his first work with that company being in the construction of its first hydro-electric plant on the Kalamazoo River.

He located in Ontario, California, expecting to devote his time to the growing of oranges, but in 1908 became connected as a director with the San Antonio Water Company and the Ontario Power Company, and in 1909 took the general managership of these two companies.

He has been very active in the development, conservation and use of water for irrigation, and when the California Mutual Water Companies' Association was formed in 1918, he became its president and has been continued in that office since then.

He conceived and constructed for the Ontario Power Company the first combination remote and automatic control hydro-electric plant built, and this type of plant has become standard practice for small powers.

GEORGE L. SWENDSEN is chief engineer and general manager of the Fresno Irrigation District, California. Mr. Swendsen is a typical representative of the successful irrigation business man. "The business features of irrigation projects have always seemed to me more important than the construction details," he says. "The executive matters are the affairs in irrigation which challenge my interest."

Mr. Swendsen was graduated from Harvard University with a B. S. degree in Civil Engineering in 1894. Since 1902 his entire career has been devoted to irrigation and hydraulic developments in Idaho, Utah and California.

From 1903 to 1906 he was U. S. Reclamation Service District Engineer for Utah and Southeastern Idaho. From 1906 to 1917 he was connected with the construction and development of irrigation and power projects on Bear River, Snake River and Weiser River in Idaho. In these years he gained a broad knowledge of the construction, management and business features of such projects, which has served him admirably in his later experience.

Coming to California in 1917, he was engaged for three years, until August, 1920, building and operating the Boston Land Company's Project of 35,000 acres in the San Joaquin Valley, served by deep well pumps and an elaborate concrete pipe system. In this project also Mr. Swendsen had business features in his direct charge on behalf of the investors.

Since August, 1920, he has been chief engineer and manager of the Fresno Irrigation District, a district which includes 243,000 acres, with 10,200 water users.

Palos Verdes Stock Issued

Permission has been granted by the California Railroad Commission to Palos Verdes Water Company to issue and sell at not less than par $200,000 of its common capital stock, on or before March 1, 1926, for the purpose of paying the cost of additions and betterments to its properties.

Two *Distinct* Advantages

Which are enjoyed by those who advertise NOW in MODERN IRRIGATION

First—Your product, and the company behind it, become immediately identified with and for the irrigation movement in a larger sense, by being represented in Irrigation's own publication from the outset. *Not* to advertise now places you in the class of those who—ostensibly at least—are not leaders, and who do not aspire to aggressive leadership in an industry which is contributing, more than any other, to the upbuilding of a great agricultural and industrial empire.

Second—Your campaign, appearing NOW, will be seen by men whose annual purchases aggregate millions; and who are planning today vast expenditures through the coming Fall and Winter season. The men who will be buying heavily in November, December and January are planning their expenditures at this very moment. Consciously, or unconsciously, they are forming their opinions, making their decisions. Here, in these pages, many a preliminary "skirmish" of competition will take place—many a silent victory will be won—months before the salesman calls.

These, therefore, are two *distinct* advantages to be gained through long-pull advertising now. Would you like to know about still other advantages, including information as to rates, circulation, etc.? If so, it's a simple matter to write a note or a telegram of inquiry. No obligation whatever is involved.

OVERHEAD IRRIGATION

OVERHEAD IRRIGATION FAVORED FOR AVOCADOS

By J. ELIOT COIT

IT IS MY experience that overhead irrigation is particularly well suited to avocados. It is commonly accepted that the amount of water required for avocados is about the same as for Citrus, but the interval is less on most soil types, and much less on sandy soils. For best results on light sandy soils, avocados should receive a light watering every ten days during midsummer. It is simpler and involves less labor to give frequent light waterings with the overhead.

In the second place, the avocado differs from most other orchard trees by being well adapted to the permanent mulch system, with no tillage after the trees come into full bearing. Such a system is impracticable, or at least very difficult, with furrow irrigation.

Compared with citrus or other orchard fruits, the avocado yields a much higher gross return per acre, thus warranting the additional expense of installing equipment for irrigation by overhead sprinkling.

Avocado Orchard and Nursery Receiving Overhead Irrigation on Rancho Sencadia, Encinitas, California. Dr. Coit, in the Accompanying Article, Enthusiastically Recommends the Overhead Method for this Fruit

IN PROPAGATING avocado trees in the nursery, it is necessary to plant the seeds on the surface of the soil with the apex of the seed exposed. The seeds must be kept continuously moist, and as this is practically impossible by furrow irrigation, nurserymen have adopted the policy of planting the seeds in beds where they can be sprayed by hand with a hose. The seedlings are later transplanted to nursery rows with consequent checking of growth, loss of time, and increase in labor. For two seasons past I have planted the seeds directly in the permanent nursery rows and irrigated with the overhead at frequent intervals. The result has been an almost perfect stand of vigorous seedlings and a three or four months shortening of the time from seed planting to salable stock. We have budded the nursery under the overhead and there has been no harm or disadvantage in wetting the buds and wrappings before they start growth.

In preparing land for furrow irrigation it is necessary to bring it to grade by cutting off the high spots and filling the low places. This is not only expensive, but it results in bald spots wherever the surface soil is removed to any depth. In such areas the trees are usually backward in development and as a result the grove lacks uniformity. These expenses and difficulties are entirely done away with when overhead irrigation is decided on and the underground part of the system put in without grading before the trees are planted.

In the event that no intercrop is intended, the uprights and sprinklers need not be installed for two or three years. Garden valves may be set at suitable intervals and the manure-filled basins about the trees watered with a hose. This requires more labor but less water and insures each and every young tree getting individual attention.

THERE is a common opinion that overhead irrigation is attended by excessive losses by evaporation. While it is impossible to measure this loss, it is my opinion that it is more than compensated for by savings made through elimination of run-off and excessive depth of percolation. My experience is that the overhead requires less water, and by perfect distribution results in better growth of trees. Furthermore, evaporation is not always an unmixed evil, and may sometimes prove a good thing. Occasionally East winds of high temperature and very low humidity blow from the desert with considerable force. Such winds always do more or less damage by drying out the foliage and causing the fruit to drop. I have found that by running the sprinklers for ten-minute periods at intervals of several hours, the rapid evaporation of moisture cools and humidifies the air with marked benefit to the trees. There is no danger of scalding the foliage by sprinkling during sunshine, as some persons imagine.

As an aid to starting an early cover-crop, overhead irrigation stands preeminent. Every rancher knows the difficulty of getting a uniform stand of cover-crop in early September by furrow irrigation. The same furrows are necessarily used for successive irrigations and soon become baked and shed water rather than absorb it. Small seeded crops like *melilotus indica* need frequent surface wettings until the little rootlets are down to

CAMPBELL
OVERHEAD IRRIGATION

DISTRIBUTES the water applied in the form of small drops just like a gentle rain—not in a mist that will be lost by evaporation or in a deluge that will wash the soil.

Gives a 100% distribution over the entire area irrigated. Apply an inch or less of "rain"; let it stand for a few hours and dig where you will and not a spoonful of dry earth can be located.

Requires less than half the water necessary for the ditch or furrow system where there is an immense waste on account of varying texture of soil and run-off.

Affords an immense saving in labor. Simply open the valves and let it "rain" on a section of one, five or ten acres for a few hours—then shut off and turn on another section. No furrowing needed in advance of irrigating.

Obviates the necessity of terracing and contour planting—even on the steepest hillsides. Trees can be planted square and every drop of water applied will soak in.

Prevents and disintegrates plow-sole—thus making sub-soiling and deep cultivation unnecessary.

Absolutely prevents damage from wind-burn. Moisture carried by the wind will entirely check evaporation from the leaves and fruit.

Saves the expense of spraying for red spider and other insects and by keeping the trees in a healthy condition will make all, or practically all, fumigation unnecessary.

Prevents June drop by eliminating the evaporation from the trees that causes it.

Gathers nitrogen from the air and forces downward distribution of nitrates and soluble parts of manure that have been applied near the surface. It also carries humus in solution below ploughed depth to all deep-lying roots.

We make complete guaranteed installations including pumping equipment for boosting machinery if desired or will sell you the necessary equipment, make your plans and superintend installation.

BOOKS *of* PRACTICAL VALUE *to the* WATER USER *and the* HYDRAULIC TECHNICAL MAN

IRRIGATION ENGINEERING

By ARTHUR POWELL DAVIS, D. SC.

Chief Engineer and General Manager, East Bay Municipal Utilities District; formerly President Am. Soc. C. E.; formerly Director and Chief Engineer, U. S. Reclamation Service.

AND

HERBERT M. WILSON, C. E.,

Mem. Am. Soc. C. E.; former Chief Engineer and Irrigation Engineer, U. S. Geological Survey.

Seventh Edition, Revised and Enlarged; Total Issue 12,000

THIS IS a rewritten and rearranged edition with much new material added. The principal difference introduced is the treatment of soils, plant food, operation and maintenance, and other lines of work where the duties of the irrigation engineer come in contact with the irrigator, such as in the preparation of land, the duty of water and its application to the land. A bibliography of standard works is given at the end of each chapter. 640 pages. 6 by 9. 249 figures and illustrations. Cloth, $4.50 net postpaid. Remittance must accompany the order. Allow from one to two weeks for transmittal of order and shipment from the publishers.

IRRIGATION PRACTICE *and* ENGINEERING

By G. A. ETCHEVERRY,

Professor of Irrigation Engineering, University of California.

In three volumes—the most comprehensive work in the field. A wealth of information of both practical and informative value for everyone interested in water development and conservation. Prices are net postpaid and remittances must accompany order. Allow from one to two weeks for transmittal of order and shipment from the publishers.

Vol. 1.—Uses of Irrigation Water and Irrigation Practice.....$2.50
Vol. 2.—Conveyance of Water..... 4.00
Vol. 3.—Irrigation Structures and Distribution System..... 4.50

Address all orders to

Book Dept., MODERN IRRIGATION

some depth. The sprinklers accomplish this very nicely, and bring about an even germination over all the area between the trees.

After several years experience with overhead irrigation on avocados, I find it convenient, economical, and productive of satisfactory growth and general health of the trees.

Overhead System Gives Efficient Distribution, Says Engineer

Describes Advantages and Needs of Overhead Sprinklers as At Present Developed

By A. G. GRAHAM

Various methods of irrigation are employed in distributing water over the land and, as in other forms of farm management, new and improved methods are constantly being adopted in irrigation practice. Commercial growers of fruit and vegetables in nearly every part of the country realize that there are periods during the growing season when the crop could be saved, or its value doubled, could they but receive a soft gentle rain of sufficient duration to furnish the desired moisture. The normal precipitation of rainfall in most sections, even in the so-called arid region of this country, is sufficient to mature crops but the distribution being beyond our control, water must be supplied when needed by artificial means. Nature's method of supplying moisture—in the form of gentle rain drops—is the ideal way and the nearer we can come to duplicating nature's method, the better the results will be.

The overhead method of irrigation has been practiced for a number of years, but it has only been within the past five years that any extensive operations have been carried on in southern California. From the investigations which have been made, certain underlying principles have been evolved, the practice of which has greatly increased the yield of crops as compared with other methods of applying water to the land. The results have demonstrated that profitable crop increases can be produced under scientific irrigation.

Efficiently to apply water to the land it is necessary to have absolute uniformity of distribution, so that all parts of the field may receive their proper amount of water. It is equally essential that no more water than plants require be furnished, and the practice of overwatering some portions in order that water may be carried to all parts of the field has resulted in many cases in waterlogging the soil. Repeated investigations have shown that over-watering is even more injurious than underwatering.

Growers are beginning to realize that the effects on the soil, resulting from the various methods of irrigating, have a decided bearing on plant growth. The texture of the soil is an important factor in the growth of plants. The soil, when over-watered, is not in a proper physical condition to allow of the free passage of air through it, and air is an important factor in plant growth. With the overhead method of irrigation, the water is distributed over the land uniformly and in the percolation of moisture down through the soil, the available plant food is carried to the hair-like roots, which are the ones that absorb the food necessary for plant growth.

The moisture is furnished in the form of a thin film surrounding the soil particles. Another important result which is noted when the overhead method of irrigation is practiced is that of supplying moisture to the leaves of plants. Plants breathe air through the pores of the leaves. The water removes the accumulated dust from the leaves, thus enabling them better to perform their work as nature intended they should.

Citrus growers have become interested in this method of irrigation and there are now between five hundred and one thousand acres of orange and lemon trees irrigated by means of sprinkler heads extending up over the tree tops. A decided interest in overhead systems is being taken by growers of crops which bring large money returns per acre, and it has been demonstrated to the satisfaction of many orchardists that better quality and quantity of oranges and lemons have been the result when water was applied in this manner.

The need now is for a type of sprinkler head which will be small and compact and at the same time have a wide sweep, and one that will operate efficiently over a long period of time, thus lowering the cost of installation and operation. A sprinkler head which, it is claimed, will ideally meet the requirements of orchardists and others who wish to irrigate large tracts of land, has been worked out in the laboratory of a California manufacturer, is now being thoroughly tested, and will soon be ready for demonstration.

Sunnyside Water Works Sold

D. G. Johns, having acquired the one-half interest of G. R. Goold in the Sunnyside Water Works System, formerly operated jointly by Johns and Goold in the Sunnyside Addition of the City of Stockton, has applied to the California Railroad Commission for approval of such transfer, and for permission to resell to Joseph Herring the system for the sum of $4,000.

SURVEY *of* IRRIGATION DEVELOPMENT

As Shown by Official Records of the Month -- Local, State, and Governmental

BIG DEVELOPMENTS CONTEMPLATED IN PERMITS

AMONG the permits to appropriate water issued by the Department of Public Works, Division of Water Rights of California during the month of July, 1925, were the following:

Permit No. 2153, Application No. 2526 (San Bernardino County). Issued to G. M. Bartlett and R. L. Bartlett, Pine Knot, California, July 13, 1925, for 0.077 cubic feet per second from Talmadge Creek and cienega at head of Seeley Creek in Section 25, T 2 N, R 1 W, for domestic purposes in Section 25. Estimated cost $20,000.

Permit No. 2154, Application No. 3979 (Inyo County). Issued to Mary A. Thompson, Trona, California, July 15, 1925, for 1.25 cubic feet per second from Surprise Canyon tributary to Panamint Valley Sink in Section 16, T 21 S, R 45 E, M. D. M. for generation of electric power in said Section 16. Twenty-eight T. H. P. to be developed. Estimated cost $12,000.00.

Permit No. 2155, Application No. 4561 (Siskiyou County). Issued to McCloud River Lumber Company, McCloud, California, July 15, 1925, for 5.57 cubic feet per second from the McCloud River in Section 7, T 39 N, R 1 W, M. D. M. for water supply for the town of McCloud. Estimated cost $75,000.00.

Permit No. 2156, Application No. 4536 (El Dorado County). Issued to Rose V. Jones, Vallejo, California, July 17, 1925, for 75 acre feet per annum from Little Iowa Creek tributary to South Fork American River in Section 33, T 11 N, R 12 E, M.D.M. for irrigation of 138,588 acres in Sections 33 and 34, T 11 N, and Sec. 3, T 10 N, all in R 12 E, M.D.M. Estimated cost $4,000.00.

Permit No. 2157, Application No. 4428 (Mendocino County). Issued to C. H. Smith, Redwood Valley, California, July 25, 1925, for 1.13 cubic feet per second from Redwood Valley branch of Russian River in Section 32, T 17 N, R 12 W, M.D.M. for irrigation of 90.38 acres in projected Section 32, T 17 N, R 12 W. Estimated cost $1,000.00.

Permit No. 2158, Application No. 4456 (Mendocino County). Issued to Hanly A. Ford (for F. A. Ford heirs) Ukiah, California, July 25, 1925, for 0.87 cubic foot per second from Russian River in Section 33, T 16 N, R 12 W, M.D.M. for irrigation of 70 acres in Lot 140 of Yokayo Rancho. Estimated cost $2,150.00.

Permit No. 2159, Application No. 3817 (Mendocino County). Issued to Peter Fray and Jesse I. Jewel, Ukiah, California, July 25, 1925, for 1.87 cubic feet per second from Russian River in Section 4 (projected) T 15 N, R 12 W, M.D.M. for irrigation of 150 acres within Lot 12 of Yokayo Rancho. Estimated cost $8000.00.

Permit No. 2160, Application No. 4258 (Stanislaus County). Issued to August Henry Voight, Modesto, California, July 25, 1925, for 0.23 cubic foot per second from Tuolumne River in Sec. 5, T 4 S, R 10 E, for irrigation of 18.13 acres near point of diversion. Estimated cost $1,500.00.

Permit No. 2161, Application No. 4520 (San Joaquin County). Issued to O. C. Cutts, Stockton, California, July 25, 1925, for 1.12 cubic feet per second from San Joaquin River in Section 5, T 1 S, R 6 E, for irrigation of 90 acres in Section 5.Estimated cost $1,500.00.

Permit No. 2167, Application No. 4154 (Los Angeles County). Issued to Simon Kuenzel, Llano, California, July 25, 1925, for 0.02 cubic foot per second from Cottonwood Canyon Spring in Sec. 22, T 4 N, R 8 W, S.B.M. for irrigation of 40 acres within Sec. 7, T 4 N, R 7 W, S. B. M. to be commingled with other waters.

Permit No. 2169, Application No. 3195 (Sutter County). Issued to Sutter Basin Company, California Fruit Bldg., Sacramento, California, July 25, 1925, for 1.38 cubic feet per second from Sacramento River in Sec. 18, T 11 N, R 3 E, M.D.M. for irrigation of 110.8 acres in Sutter Basin Subdivision No. 1.

Permit No. 2170, Application No. 3199 (Sutter County). Issued to Sutter Basin Company, California Fruit Bldg., Sacramento, California, July 25, 1925, for 1.07 cubic feet per second from Sacramento River in Sec. 34, T 12 N, R 2 E, M.D.M. for irrigation of 86 acres within SE ¼ of Section 34 and SW ¼ of Section 35, all in T 12 N, R 2 E. Estimated cost $5,000.00.

Permit No. 2171, Application No. 3200 (Sutter County). Issued to Sutter Basin Company, California Fruit Bldg., Sacramento, California, July 25, 1925, for 1.15 cubic feet per second from Sacramento River in Sec. 27, T 12 N, R 2 E, M.D.M. for irrigation of 92 acres in Subdivision No. 4 Sutter Basin Company. Estimated cost $5000.00.

Permit No. 2172, Application No. 3201 (Sutter County). Issued to Sutter Basin Company, California Fruit Bldg., Sacramento, California, July 25, 1925, for 0.72 cubic feet per second from Sacramento River in Sec. 29, T 12 N, R 2 E, M.D.M. for irrigation of 58 acres within Subdivision No. 4 of Sutter Basin Co., being also within NE ¼ Sec. 29, T 12 N, R 2 E. Estimated cost $5000.00.

Permit No. 2173, Application No. 3202 (Sutter County). Issued to Sutter Basin Company, California Fruit Bldg., Sacramento, California, July 25, 1925, for 1.88 cubic feet per second from Sacramento River in Sec. 2, T 12 N, R 1 E, M.D.M. for irrigation of 150.48 acres in said Section 2. Estimated cost $5000.00.

Permit No. 2174, Application No. 3205 (Sutter County). Issued to Sutter Basin Company, California Fruit Bldg., Sacramento, California, July 25, 1925, for 15.21 cubic feet per second from Sacramento River in Section 22, T 11 N, R 3 E, M.D.M. for irrigation of 608.5 acres in Sections 20 and 21, T 11 N, R 3 E. Estimated cost $7000.00.

Permit No. 2175, Application No. 3206 (Sutter County). Issued to Sutter Basin Company, California Fruit Bldg., Sacramento, California, July 25, 1925, for 87.49 cubic feet per second from Feather River in Section 9, T 11 N, R 3 E, M.D.M. for irrigation of 3499.6 acres in Sections 32, 33, 34, T 12 N, R 3 E, Sections 4, 5, 8, 9, 10, 15, 16, 21, 22, T 11 N, R 3 E, M.D.M. Estimated cost $30,000.00.

Permit No. 2176, Application No. 3207 (Sutter County). Issued to Sutter Basin Company, California Fruit Bldg., Sacramento, California, July 25, 1925, for 53.17 cubic feet per second from Feather River in Section 22, T 12 N, R 3 E, M.D.M. for irrigation of 2126.65 acres within Sections 10, 14, 15, 21, 22, 23, 27, 28, T 12 N, R 3 E. Estimated cost $20,000.00.

Permit No. 2177, Application No. 3208 (Sutter County). Issued to Sutter Basin Company, California Fruit Bldg., Sacramento, California, July 25, 1925, for 18.14 cubic feet per second from Feather River in Section 10, T 12 N, R 3 E, M.D.M. for irrigation of 725.67 acres within Sections 3, 4, 9, 10, 15, 16, T 12 N, R 3 E. Estimated cost $3500.00.

Permit No. 2178, Application No. 4176 (Riverside County). Issued to H. G. Tarbett, Wildomar, California, July 25, 1925, for 0.05 cubic foot per second from unnamed spring, Elsinore Lake drainage in Section 33, T 6 S, R 4 W, S.B.M. for irrigation of 40 acres. Estimated cost $2,000.00.

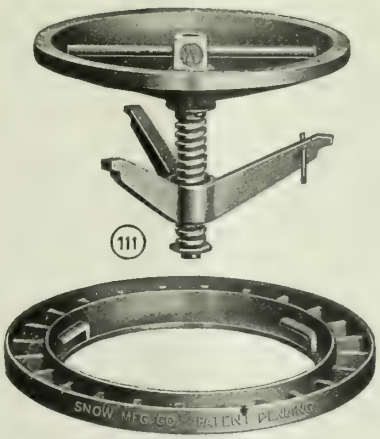
Permit No. 2179, Application No. 4485 (Humboldt County). Issued to David S. Ward, Eureka, California, July 25, 1925, for .62 cubic foot per second from Freshwater Creek, tributary to Humboldt Bay in Section 33, T 5 N, R 1 E, H.M. for irrigation of 49.6 acres in above Section. Estimated cost $1250.00.

Permit No. 2180, Application No. 4499 (Mendocino County). Issued to Charles S. Howard Company, San Francisco, California, July 28, 1925, for 4.46 cubic feet per second and 300 acre feet per annum from Forsythe Creek in Section 18, T 17 N, R 13 W. M.D.M. for irrigation of 357 acres near point of diversion.

Permit No. 2181, Application No. 4168 (San Diego County). Issued to Joseph Poggi, Chula Vista, California, July 31, 1925, for 1.16 cubic feet per second from well in Valley of Sweetwater River in Sec. 34,

·SNOW·

IRRIGATION & WATER CONTROLLING APPLIANCES



SNOW IDEAL ALFALFA VALVES require no wrench, have no projecting parts and when installed flush with the ground, present no obstruction to the mowing machine.

A bar handle with Acme machine cut thread steel screw working through a bronze nut, opens the valve to full capacity without removing the lid. However, the lid and spider may be entirely removed, leaving an unobstructed opening the full diameter of the standpipe, making possible the removal of debris or the attaching of a taper elbow for surface pipe. The packing in the lid being of braided hemp boiled in tallow, is soft, yielding and durable, insuring a water tight connection and easy operation.

When set in place, the outer ring of the base forms a water tight seat for the SNOW portable hydrant.

IDEAL valves are made to attach to screw or riveted pipe as well as concrete pipe.

Harbert, Adin, California, for 0.75 cubic foot per second from three unnamed springs, tributary to Ash Creek and Pit River, to be diverted in Sec. 21, T 39 N, R 9 E, M.D.M. for agricultural purposes on 60 acres in Sec. 28, T 39 N, R 9 E, M.D.M. Estimated cost $500.00.

Application No. 4676 (Ventura and Los Angeles Counties) — Ventura Power Company, 1121 Balfour Bldg., San Francisco, for (1) 200 cubic feet per second and (2) 75,000 acre feet per annum from Piru Creek, tributary to Santa Clara River, to be diverted in (1 and 2) Sec. 30, T 7 N, R 18 W; Sec. 3, T 6 N, R 18 W, and (1) Sec. 34, T 5 N, R 18 W, S.B.M. To be used for agricultural purposes.

Application No. 4677 (Ventura County)—Ventura Power Co., 1121 Balfour Bldg., San Francisco, for (1) 200 cubic feet per second and (2) 111,800 acre feet per annum from Sespe Creek, tributary to Santa Clara River, to be diverted in (1 and 2) Sec. 2, T 4 N, R 20 W, and (2) Sec. 6 ,T 5 N, R 22 W, and Sec. 36, T 6 N, R 20 W, S.B.M. To be used for agricultural purposes.

Application No. 4681 (Yuba County)—Dry Creek Irrigation District, care Roscoe S. Creps, Wheatland, California, for 25 cubic feet per second and 17,000 acre feet per annum from Dry Creek, tributary to Feather River, to be diverted in Section 32, T 15 N, R 6 E, M.D.M., to be used for agricultural purposes in proposed Dry Creek Irrigation District.

Application No. 4682 (Inyo County) — Burchard Fine, Coso Junction, Inyo County, California, for 0.75 cubic foot per second from East Sacatar Creek, tributary to Sacatar Canyon, to be diverted in Sec. 21, T 22 S, R 37 E, M.D.M. for irrigation on about 100 acres in Secs. 21 and 22, T 22 S, R 37 E, M.D.M.

Application No. 4685 (San Diego County) —Geo. T. Simpson, 1230 B Street, San Diego, Calif., for 1.69 cubic feet per second and 150 acre feet per annum from Santa Maria Creek, tributary to San Pagual Creek, to be diverted in Section 11, T 13 S, R 1 W, S.B.M. for agricultural and domestic purposes on 135 acres in Sec. 11, T 13 S, R 1 W, S.B.M. Estimated cost $6,000.00.

Application No. 4688 (Riverside County) —Philip Playter, Box 1780, Arcade Station, Los Angeles, Calif., for 1.0 cubic foot per second from Santa Margarita River, tributary to Pacific Ocean, to be diverted in Sec. 33, T 8 S, R 3 W, S.B.M. for irrigation and domestic purposes, Sec. 33 and 34, T 8 S, R 3 W, S.B.M.

Application No. 4689 (Plumas County)—Feather River Power Co., Hobart Bldg., San Francisco, for 80,000 acre feet per annum from Middle Fork Feather River, tributary to Feather River, to be diverted in Section 23, T 22 N, R 12 E, M.D.M. and Sec. 15, T 21 N, R 6 E, M.D.M. for generation of hydro-electric energy in Sec. 8, T 20 N, R 6 E, M.D.M. Estimated cost $1,250,000.00.

Application No. 4690 (Mendocino County) —Charles Thomas Smith, Hopland, California, for 1.0 cubic foot per second from Russian River, tributary to Pacific Ocean, to be diverted in Sec. 33, T 13 N, R 11 W, M.D.M. for agricultural purposes on 80 acres in Secs. 32 and 33, T 13 N, R 11 W, M.D.M.

Application No. 4692 (Santa Barbara County)—Union Sugar Co., care McKinstry, Faber & Firebaugh, 703 Market St., San Francisco, for 3.60 cubic feet per second from Santa Ynez River, tributary to Pacific Ocean, to be diverted in Sec. 23, T 7 N, R 35 W, S.B.M., for agricultural purposes on 288 acres in Sec. 23, T 7 N, R 35 W, S.B.M.

Application No. 4697 (Inyo County)—E. H. Cook and James F. Chrysler, Lone Pine, for 0.375 cubic foot per second from Coyote Creek, tributary to Owens Valley Watershed, to be diverted in Sec. 30, T 16 S, R 36 E, M.D.M. for agricultural and domestic purposes on 40 acres in Sec. 31, T 16 S, R 36 E, M.D.M. Estimated cost $2,000.00.

Application No. 4698 (Santa Clara County)—Montezuma Mountain Ranch School, Collins Creek, for 0.25 cubic foot per second from Collins Creek, tributary to Los Gatos Creek drainage area, to be diverted in Sec. 6, T 9 S, R 1 W, M.D.M. for domestic and agricultural purposes on 15 acres in Sec. 6, T 9 S, R 1 W, M.D.M. Estimated cost $12,000.00.

Application No. 4699 (Sutter County)—Geo. E. Springer, 351 California St., San Francisco, California, for 2.0 cubic feet per second from Sacramento River, tributary to Suisun Bay, to be diverted in Section 8, T 14 N, R 1 E, M.D.M. for agricultural purposes on 160 acres in Sec. 11, T 14 N, R 1 E, M.D.M. Estimated cost $25,500.00.

Application No. 4701 (Sierra County)—E. O. Carvin, care Geo. F. Taylor, Downieville, California, for 10 cubic feet per second from North Fork of South Fork of North Fork of Yuba River, tributary to Yuba River, to be diverted in Sec. 6, T 20 N, R 13 E, M.D.M. for power purposes in Sec. 1, T 20 N, R 12 E, M.D.M. Estimated cost $10,000.

Application No. 4702 (Butte County)—A. G. Eames, care Chico Chamber of Commerce, Elks Bldg., Chico, Calif., for 500 cubic feet per second and 100,000 acres feet per annum from Butte Creek, tributary to Sacramento River, to be diverted in Sec. 4, T 21 N, R 2 E, M.D.M. for agricultural purposes on 40,000 acres in T 22 N, Rgs. 1 E and 1 W, and T 21 N, Rgs 1 and 2 E, and T 20 N, Rgs 1 and 2 E.

Application No. 4703 (Fresno County)—San Joaquin Light & Power Corporation, Fresno, California, for 220 cubic feet per second from North Fork of Kings River, tributary to Kings River, to be diverted in Sec. 6, T 11 S, R 28 E, Sec. 1, T 11 S, R 27 E, Sec. 3, T 12 S, R 27 E, Secs. 10 and 12, T 12 S, R 26 E, M.D.M. for generation of hydro-electric energy in Sec. 6, T 11 S, R 28 E, Sec. 34, T 11 S, R 27 E, and Sections 12, 11 and 19, T 12 S, R 26 E, M.D.M. Total T.H.P. to be developed, 141,750. Estimated cost $32,300,000.00.

Application No. 4704 (Fresno County)—San Joaquin Light & Power Corporation, Fresno, California, for (1) 135, (2) 60, (3) 105, (4) 30, total 330 cubic feet per second from (1) North Fork Kings River, (2) Fleming Creek, (3) Post Corral Creek, (4) Helms Creek, tributary to North Fork Kings River and Kings River to be diverted in Sec. 7, T 10 S, R 29 E, Sec. 1, T 10 S, R 28 E, Sec. 35, T 9 S, R 28 E, Sec. 7, T 10 S, R 28 E, M.D.M. for generation of hydro-electric energy in Section 30, T 10 S, R 28 E, M.D.M. T.H.P. to be developed, 60,750. Estimated cost $10,000,000.00.

Application No. 4705 (Fresno County)—San Joaquin Light & Power Co., Fresno, California, for 86,000 acre feet per annum from (1) Seven unnamed lakes in Fleming Basin, (2) Four unnamed lakes in Red Mountain Basin, (3) Devils Punch Bowl Lake, (4) seven unnamed lakes in Bench Valley Basin (5) five unnamed lakes in Black Cap Basin, (6) Half Moon Lake, (7) North Fork Kings River, (8) Fleming Creek, (9) Post Corral Creek, (10) Helms Creek, tributary to North Fork Kings River and Kings River to be diverted in T 9 and 10 S, R 27, 28, 29 and 30 E, M.D.M., as shown on maps on file with the Division of Water Rights, for generation of hydro-electric energy in NE ¼ of Section 30, T 10 S, R 28 E, M.D.M. T.H.P. to be developed, 60,750. Estimated cost $10,000,000.00.

Application No. 4706 (Los Angeles County)—City of Alhambra, care T. B. Downer, Alhambra Water Department, Alhambra, California, for 30,000 acre feet per annum from San Gabriel River, tributary to Pacific Ocean, to be diverted in Sec. 13, T 1 N, R 10 W, S.B.M. for municipal purposes.

Application No. 4710 (Lake, Napa, Solano counties)—B. C. Rogers, 3335 Fernside Ave., Alameda, Calif., for 750 cubic feet per second and 300,000 acre feet per annum from Putah, Pope and Eticura Creeks, tributary to Sacramento River, to be diverted in Sec. 25, T 8 N, R 2 W, M.D.M. to be used for agricultural purposes on 60,000 acres. Estimated cost $150,000.00.

Application No. 4711 (Riverside County) —John Terribilini, care Davidson and Fulmore, 646 W. 7th St., Riverside, California, for .25 cubic foot per second from underground water tributary to San Jacinto River, to be diverted in Sec. 2, T 4 S, R 1 E, S.B.M. to be used for agricultural and domestic purposes on 30 acres in Sec. 2, T 4 S, R 1 E, S.B.M. Etimated cost $4,000.00.

Application No. 4712 (Placer County)—Mt. Pleasant-Lincoln Irrigation District, care E. Emerson, Hoar Co., 995 Market St., San Francisco, California, for 300 cubic feet per second and 100,000 acre feet per annum from Bear River, tributary to Feather River, to be diverted in Sec. 2, T 13 N, R 8 E, M.D.M. for agricultural and domestic purposes on 600,000 acres in T 12 N, Rgs 5, 6, 7 E and T 13 N, Rgs 5, 6, 7 E, M.D.M.

Application No. 4715 (Lake, Napa, Yolo, Solano Counties)—B. C. Rogers, 3335 Fernside Blvd., Alameda, for 1500 c.f.s. and 340,000 a.f.a. from Putah, Pope, Capell, Eticura Creeks and tributaries, tributary to Sacramento River, to be diverted in Sec. 25, T 8 N, R 2 W, M.D.M. for agricultural purposes on 120,000 acres. Estimated cost $150,000.00.

OREGON

The following list includes the more important applications as filed in the office of Rhea Luper, State Engineer, of Oregon, for the last month for which records are available:

L. F. Sandoz, of The Dalles, covering the appropriation of water from Mill Creek for irrigation of 5 acres in Wasco County, at a cost of $1,500.

Leonard H. Hildeman of Portland, covering the appropriation of water from Buckner Creek for irrigation purposes.

Maggie Henderson of Pendleton, covering the appropriation of water from Catherine Creek for supplemental irrigation of 98.25 acres in Union County.

B. J. Crowley of Lakeview, covering the construction of the Bull's Prairie Reservoir for storage of 809 acre feet of water from Mud Creek, and the appropriation of the stored water for development of 100 theoretical horsepower and domestic purposes in Lake County, at an approximate cost of $30,000.

Mrs. Almeda T. Bowles of Seattle, covering the appropriation of water from Johnson Creek for irrigation of 5 acres in Multnomah County, at a cost of approximately $10,000.

New Incorporations

The following new water companies have been incorporated in California during the last month for which official records are available:

No. 114938—ARVIN MUTUAL WATER CO., (a California company). Directors: E. C. O'Boyle, Bakersfield; T. N. Harvey, Bakersfield; Geo. A. Osner, Arvin; Eugene Stroud, Arvin; C. W. Chaplin, Arvin, (each 1 share). Date of filing, July 14, 1925. Capital stock, $50,000. Par value, $100. Amount subscribed, $500. Place of business, Arvin, Kern County, California.

Purposes—"To dispose of water to stockholders at cost; operate wells and pumping plants."

Articles filed by Wiley & Harvey, 19 Security Trust Co. Bldg., Bakersfield.

No. 115114—BALLONA WATER COMPANY, (a California company). Directors: F. J. Seymour, Edna G. Tobias, Hulda Wurts, all of Los Angeles, (each 1 share). Date of filing, July 30, 1925. Place of business, Los Angeles. Capital stock, $150,000. Par value, $100. Amount subscribed, $300.

Purposes—"To supply water for domestic and agricultural uses."

Articles filed by Moote & Patterson, 515 H. W. Hellman Bldg., Los Angeles.

No. 115121—HILLCREST KNOLLS WATER CO., (a California company). Directors: Sol Koff, 535 Taylor street, San Francisco; Sol Rubinstein, 535 Taylor street, San Francisco; C. Nunlist, 6749 California street, San Francisco; C. Sousa, Berry avenue, Hayward; E. Massey, 668 Brooklyn avenue, Oakland; (each 1 share). Date of filing, July 30, 1925. Place of business, Oakland. Capital stock, $46,300. Par value, $100. Amount subscribed, $500.

Purposes—"To supply water for domestic and irrigation solely to its stockholders and conduct business without profit."

Lands to be supplied with water are known as Hillcrest Knolls, Alameda County, California.

Articles filed by Norman A. Eisner, 344 Mills Bldg., San Francisco.

No. 115132—HOMEWOOD MUTUAL WATER CO., (a California company). Directors: Ralph P. Maskey, Wm. A. Bowen, W. H. Schroder, Maud Mowry, all of Los Angeles; S. E. Shafer, Buena Park, (each 1 share). Date of filing, July 31, 1925. Place of business, Los Angeles. Capital stock, $25,000. Par value, $25. Amount subscribed, $125.

Purposes—"To distribute water among its stockholders at cost who own land within the present limits of tracts numbered 625, 714, 722, 729, and 650 County of Orange, California."

Articles filed by W. R. Schroder, 300 Corporation Bldg., Los Angeles.

No. 115167—LAGUNA-MAYWOOD MUTUAL WATER CO. NO. 1, (a California company). Directors: S. C. Graham, F. M. White, J. S. Valentine, Lillian Bischoff, Kay S. Santoro, all of Los Angeles, (each 1 share). Date of filing, August 3, 1925. Place of business, Los Angeles. Capital stock, $25,000. Par value, $1.00. Amount subscribed, $5.00.

Purposes—"To bore and maintain wells and pumping plants, to distribute water to its stockholders at cost for use on lands owned by the Laguna-Maywood Land Corporation deed to them by the Arcadia Bandini Baker Estate containing 428.236 acres net."

Articles filed by John E. Biby, 1015 Citizens National Bank Bldg., Los Angeles.

No. 115194—TOPANGA PARK MUTUAL WATER CO., (a California company). Directors: J. H. Bonnell, H. J. Ruess, Geo. M. Adair, E. D. Halliwell, Los Angeles; R W. Gammon, Topanga, California, (1 share each). Date of filing, August 5, 1925. Place of business, Los Angeles. Capital stock, $1.000. Par value, $1.00. Amount subscribed, $5.00.

Purposes—"To supply water to stockholders and not for public."

Articles filed by John Schlegel, 322 H. W. Hellman Bldg., Los Angeles.

No. 115259—THE TOPANGA BEACH WATER ASSOCIATION, (a California company). Directors: G. E. Alexander, 724 South Los Angeles street; Fred Mansur, 827 Coronado Terrace; Josiah F. Lyon, 312 Pacific Electric Building; Geo. W. Mackie, 257 Werdin Place; I. K. Loomis, 228 South Los Angeles street, all of Los Angeles. Date of filing, August 10, 1925. Place of business, Topanga Beach, Los Angeles County. Capital stock, none. Membership fee, $15.00.

Purposes—"To own and develop lands and subdivide for residences and farms and to drill for water and sell water for domestic and irrigation purposes and charge rates and tolls for same."

Articles filed by Fred Mansur, 718 Title Insurance Bldg., Los Angeles.

"6 years without repairs"~ says one big user of~
KIMBALL
DIRECT FLOW TURBINE
PUMPS

That is one of the many reasons why such a large number of the big users of pumps have adopted the Kimball Direct Flow Turbine Pumps.

Write for descriptive booklet.

AMONG OUR CONTRIBUTORS

Editorial Jottings About Current and Forthcoming Feature Articles, Dealing With Practical Problems of Hydraulics, and the Men Who Have Written Them

MEN who are actually doing things in irrigation—who are in daily touch with the practical affairs of the irrigation district, or the water company are the men who are writing for MODERN IRRIGATION. It is this type of contributor that has something definite to tell our readers. In this issue, such contributors have a predominant place.

H. I. Wood, construction engineer, who contributes to this number a description of the development work now being completed in the Roosevelt Water Conservation District, has been in active contact with the activities in this section of Arizona. Mr. Wood is associated with Fred Tibbetts, well-known consulting engineer of San Francisco, and represented him in co-operation with Reed and Baker, of Phoenix, who are the engineers of the Roosevelt Water Conservation District, in supervising the recent developments there.

EARL C. POUND, who has written for this issue a discussion of the reorganization program undertaken by the Imperial Irrigation District, is president of the district, and, as such, a prominent figure in irrigation affairs in the west. Probably no single irrigation district in the west, unless it might possibly be the Salt River Valley project, is so well known outside of its own immediate territory. Recently this district, and its board of directors, have been even more prominently in the lime-light of public attention as the result of internal controversies. The directors of the district have been accused of using undue influence in aiding the political fortunes of the Swing-Johnson bill for the development of the Colorado River, and four of them are now facing accusations preferred by the grand jury. Simultaneously they have launched a reorganization plan, based on the need for economy in the affairs of the district, which has resulted in the dismissal of several major employees of the district.

Believing that almost every reader of MODERN IRRIGATION would be interested in hearing Mr. Pound's explanation of the troubled situation in his district, the editor invited him to give his own story of the plans and purposes of the Board of Directors. His article, beginning on page 13, is the result.

MEMBERS of the editorial staff have prepared the articles on pages 14, 15, and 16, the first of which deals with the magazine's Board of Advisors and introduces the three men who constitute the group on that board representing the Irrigationists; the second summarizing the events of the recent Tri-State Colorado River conference at Phoenix; and the third giving some advance information on the Oregon Irrigation Congress, which meets early in October in Grant's Pass, Oregon.

JOHN R. JAHN is an irrigation engineer who is especially interested in the mathematical and economic aspects of that many-sided profession. His article on the necessity for economic analysis in irrigation engineering will be of interest not only to the engineers among our readers, but to all who are interested in the problems involved in determining the financial feasibility of a given task in irrigation.

Throughout his experience Mr. Jahn has been primarily interested in engineering mathematics, and has a record of real accomplishment in simplifying some of the formulae and mathematical processes used by irrigation engineers. He is the inventor of the "Hydraulic Calculator" for the solution of flow-of-water problems by means of a straight-line diagram chart. He has also devised an ingenious method of surveying topography, using logarithmic processes.

Mr. Jahn has had considerable practical field experience as assistant engineer on the Delhi and Durham projects in California under Dr. Elwood Mead, and for the past several years has been in private practice. He has done special work for Charles H. Lee, Fred H. Tibbetts, and W. F. McClure, California state engineer. His home and office are in Berkeley, California.

AS A CONSULTING horticulturist of Southern California, Raymond E. Nebelung is vitally interested in problems of water supply and water use, and his article in this issue, dealing with some of the special irrigation problems which attend an abnormally low water level, is intended to be helpful to irrigators and irrigation executives who are this year faced with the knotty question of a low water table.

Mr. Nebelung was graduated from the College of Agriculture of the University of California in 1914, having specialized in citriculture during his course. From 1918 to 1921, he served as Farm Advisor in Riverside County. In 1921 and 1922 he was in South Africa as a citrus specialist for the Division of Horticulture of the government of the Union of South Africa, and since 1922 has been acting as a consulting horticulturist in Orange and Riverside counties. In addition to his consulting work, Mr. Nebelung exercises supervision over a number of citrus groves which are owned by non-residents.

OTHER contributors in this issue are men equally well qualified to discuss the problems on which they write. Harvey S. Bissell is well known among men interested in irrigation and conservation in southern California and the entire west. He has been prominent in the affairs of the Southern California Conservation Association, of which he tells in his article, and is now first vice-president of that organization. His home is in La Crescenta, California. W. H. Nalder is a successful engineer employed by the U. S .Bureau of Reclamation. Hubert Work, whose speech recently delivered at American Falls, Idaho, is reprinted in this issue, is secretary of the Department of Interior. S. M. Haskins, author of the article on the California Irrigation District Act, is a member of the legal firm of Gibson, Dunn & Crutcher, Los Angeles. J. Eliot Coit is an agriculturist of practical experience, and proprietor and director of the Coit Agricultural Service.

EDWARD HYATT, JR., chief of the Division of Water Rights of the California State Department of Public Works, is another man whose daily activities bring him into touch with many types of irrigators in many parts of the west. In a recent conference with the editor Mr. Hyatt outlined a series of articles which are to be prepared, by engineers of his Division, for later publication in MODERN IRRIGATION.

These articles will be written not only from the standpoint of the California irrigator, who is interested in improving his acquaintance with the functioning of this department of the state government, and which bears such a direct relationship to irrigation activities, but from the standpoint also of readers throughout the west. The latter, of course, have a real concern in comparing their own state systems of water control with that in effect in California, where it may be said that irrigation is farthest advanced in many ways.

SUCH topics as "The Benefits of Distribution of Water by Water Masters"; "Methods of Determination of Water Rights"; and "How the Division of Water Rights Functions" will be discussed in this series, each article being prepared by an expert in the particular line involved. Reports of the actual work being accomplished by the Division will also be presented through the columns of MODERN IRRIGATION, from time to time.

BEGINNING in a very modest way in this issue, MODERN IRRIGATION will maintain an editorial department devoted to the problems and concerns of municipal water works and water companies serving the domestic demand of cities. Some very interesting features are planned for this department for forthcoming numbers. One of the first of these will be an article descriptive of the Garza Dam, which is being constructed by the city of Dallas, Texas, to create a new reservoir for municipal purposes. This dam is now about fifty per cent completed, and the structure itself, exclusive of lands, clearing, revision of road systems, etc., will cost about $3,500,000. R. A. Thompson, formerly chief engineer of the Railroad Commission, State of California, and now a member of Nagle & Thompson, water reservoir engineers of Dallas, will write the article describing the work entailed in the construction of this big dam.

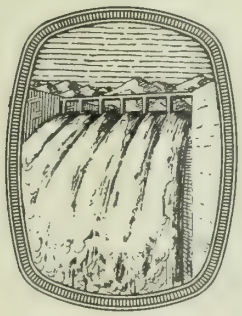
Petroleum World 626 S. SPRING ST., LOS ANGELES, CALIF. Modern Irrigation

CLARENCE J. MORLEY

Governor of the State of Colorado, and a leader of the group of upper basin state governors who have injected a new angle into the tangled Colorado River problem by their declaration in opposition to any developments on the lower river until the rights of the upper states are safeguarded by adequate agreements. Governor Morley, in a statement to MODERN IRRIGATION, asserts: "I am very hopeful of the ultimate ratification of the Colorado River Compact, which offers the most logical solution of this whole problem."

MODERN Irrigation
The Magazine of Applied Hydraulics



Volume 1 OCTOBER, 1925 Number 4

The Progress *of* Irrigation

THE REVEREND Mr. Malthus was a wise man. In addition to being a student of theology he knew several important things about poltical economy, and in what we now call the Malthusian law, or theory, he postulated: that population tends to increase in *geometrical* proportion (continually doubling), while the means of subsistence grows only arithmetically, and, as a consequence, either population must be limited by artificial restraint or the standard of living will be progressively lowered.

Malthus foresaw impending disaster for the increasing population of Europe. But his gloomy forebodings were not realized. New continents opened up, and the means of subsistence outstripped the most prolifically increasing population. His premises were right, but he could not foresee at the beginning of the nineteenth century, what was to be accomplished toward making man a more efficient unit of production, and in expanding the resources of the world.

The Malthusian law still operates. Population grows more rapidly than the normally increasing means of livelihood. But as population grows, men have a way of finding new land to till, new crops to raise, and new means of obtaining enough to supply the increasing family of mankind.

Those who look askance on the advance of irrigation frequently commit the fallacy of assuming that the world is static. It is not static, but dynamic. Especially is this true of the great west, which has exceeded the most sanguine visions of its pioneers, and continues to amaze even those most familiar with it.

THE UNITED STATES of today, with a population of 115,000,000, is not the United States that justifies the continual progress of irrigation in all parts of the west. But it takes years to bring big projects into being, and more years to make them productive. It is the United States of the future that these developments are being built to serve—the 150,000,000 mouths that will be demanding bread and meat in another quarter of a century.

The West, particularly, must be judged not by what it is, but by what it will be. In every part of the west population increases faster than the average for the country at large. Food products produced on irrigated land were once com-

pelled to find their market in the eastern centers of population exclusively, but as the cities of the Pacific Coast and northwest continue to grow, they form centers of demand that must be supplied. Consider, for instance, Los Angeles' growth to the status of a great city, over a span of only a few years—and still going on. Around the metropolitan center more and more land is being withdrawn from agricultural use and settled by an urban population. Thus as the demand grows the supply is diminished, and irrigation enterprises, to enlarge the farming acreage on which cities must depend for their existence, are increasingly in demand.

PRESIDENT COOLIDGE, speaking on reclamation, has said: "Lay your plans for twenty years in advance. The population of this country is increasing very rapidly. The fertility of the older farms is being exhausted. We will need that new country to furnish food and produce wealth for the people of the United States."

Irrigation is one of the chief economic factors that can knock the Malthusian theory into a cocked hat. It means new wealth, new resources, new land for settlement, new life for many.

Irrigation enthusiasts of the state of Washington, protesting against the recent unfavorable report of the commission which investigated the Columbia Basin project, base their objections on this expected increase of population. As told in another part of this issue, some of them desire immediate development in spite of the report's decision that the construction of the project is not yet demanded by local or national conditions, and will make a fight before Congress to secure it. Almost every voice, however, is united in an expression of confidence that it is a matter of time, only, until the growth of the west will require it, and this mammoth undertaking will be a reality. The progress of irrigation is irresistible and inevitable.

AS THE SUMMER draws to a close, and the period of maximum construction activity in the irrigation country is ushered in, large developments are going forward in practically every western state.

The Nevada Irrigation District, Nevada County, California, has purchased important water rights which have been in litigation, and is expected to proceed immediately with the construction of the first unit of a six million dollar project which will eventually irrigate 140,000 acres of land.

Land appraisal work has been begun on the Kittitas High-line Canal, in Washington, and actual construction is expected to be begun early in 1926. Engineering data for the construction has been completed, an appropriation of $750,000 has been made by Congress to start the work, and the big project may be said to be fairly under way. Its construction cost is estimated at $9,000,000.

Commissioners of Jefferson County, Washington, have applied for water rights to make possible the irrigation of 60,000 acres of land, and the development of power and municipal water supply for Port Townsend at an estimated total cost of $8,000,000.

Similar developments, of lesser magnitude, are reported from all parts of the west. New irrigation districts are being formed, and older ones are beginning new construction work. The advance of irrigation proceeds without interruption, and a temporary delay in one section is offset by rapid forward strides elsewhere.

WELCOME rains in Colorado and Arizona during the late summer gave to irrigation districts which depend on the Colorado River for their water supply assurance of a satisfactory year. The Imperial Valley will especially be benefitted by this timely rainfall. Cotton acreage in the valley this year is 13,500 acres less than it was in 1924, and the chief reason for the drop was the fear of a disastrous water shortage. Cotton in the valley was pronounced in better condition than for several years past, and with the Colorado flowing at peak in September, there was good cause for optimism among the growers. Last year at the first of September water was being allocated to acreage and fear was felt that it might be necessary to cut off irrigation water altogether in some places.

LOS ANGELES means to keep her municipal water supply a step ahead of its needs. A program involving the drilling of many deep wells and the installation of a mile-long filtration system, to cost, ultimately, more than a million dollars, was recently announced by the municipal water bureau of that city. Much of Los Angeles' phenomenal growth has been ascribed to the fact that it planned years in advance for its water supply, and evidently that same policy is to be followed in the future. Los Angeles hopes ultimately to bring water for domestic use from the Colorado River, but in the meantime it will not neglect other sources of development. The Los Angeles "River," considered a great joke by those who see only its dry surface, has really a large and reliable underground flow which remains the principal source of the water supply for a large portion of the city, and the supply from it will be greatly increased by the work now contemplated.

MODERN IRRIGATION is deeply appreciative of the fact that its undertakings on behalf of irrigation have been recognized in so signal a manner by the Western Irrigation Equipment Association, which organization, on September 11th last, conferred its first Honorary Membership upon a representative of the magazine and, by special resolution, designated it as the "official publication" of the Association. We esteem these honors the more highly because they have been conferred without any solicitation or overtures whatsoever upon the part of MODERN IRRIGATION, *or by anyone acting for, or with the knowledge of, the publishers. We can acknowledge them properly, at this time, only by saying that we are deeply gratified at the action of the Association, and will continue in an earnest effort to merit the approval and support of this and every organization that is sincerely working for the advancement and welfare of Irrigation and its allied hydraulic industries.*—THE PUBLISHERS.

C. F. ZIMANSKY
Re-elected as President of W. I. E. A. at annual meeting.

Western Irrigation Equipment Asociation Honors *Modern Irrigation*

Resolution Recognizes the Magazine as "Official Publication" and Confers Honorary Membership Upon Executive of the Company

TANGIBLE recognition of the work which MODERN IRRIGATION has undertaken, and is beginning to accomplish already in the western hydraulic industry, was accorded in a graceful way by the Western Irrigation Equipment Association at its annual meeting, held at Sacramento, on September 11, 1925.

Two very high compliments were paid to the magazine. Owen Brown, president of the Petroleum World Publishing Company, publishers of MODERN IRRIGATION, was elected an honorary member of the association—the first man to be so honored since the founding of the organization. By action of the executive committee, MODERN IRRIGATION was designated the official publication of the association. The following excerpts from the records give an account of the proceedings in official language:

FROM THE minutes of the meeting of the Executive Committee:

"Upon motion made by Jos. H. Cox, and seconded by J. J. Merritt, MODERN IRIGATION was adopted as the official publication of the Western Irrigation Equipment Association."

"It was unanimously agreed that, on account of the support given us by MODERN IRRIGATION, the W. I. E. A. should tender the chief executive of that timely publication an honorary membership in the association."

"Upon motion by Jos. H. Cox, seconded by J. J. Merritt, it was decided to send a telegram to Mr. Owen Brown, president of the publishers of MODERN IRRIGATION, asking permission to present his name before the open meeting of the association as a candidate for Honorary Membership."

From the minutes of the annual meeting:

"It was moved by Jos. H. Cox and seconded by C. A. Utley that, in accordance with Article 5, Section 3, of the Constitution of the Association, an honorary membership in the Western Irrigation Equipment Association be conferred on Mr. Owen Brown, president of MODERN IRRIGATION. Motion carried."

BOTH of these actions by the association came to the magazine and its publishers as a complete surprise. Neither had been anticipated nor solicited; and not until the receipt of official notice from C. A. Utley, secretary of the association, did the office of the publication know what had been done by the W. I. E. As. In a letter to Mr. Brown, Secretary Utley says:

"This is the first honorary membership that the Association has ever conferred, and you were chosen for this honor in recognition of the way in which you and and your magazine have 'put your shoulders to the wheel' in the interest of irrigation."

The section of the association's constitution governing the conferring of honorary membership provides: "Honorary membership may be conferred on unanimous recommendation of the Executive Committee and by vote of the Association, at any regular meeting, upon

JOS. H. COX

Vice-President of the Frank J. Kimball Company, who was chosen to succeed himself as vice-president of the Association.

distinguished designers, inventors, engineers, or others who have rendered signal service in promoting the knowledge of irrigation and hydraulics, or the adoption of more improved methods."

MODERN IRRIGATION'S interest in the work of the W. I. E. A., as manifested in the past, has been based upon its expressed desire to co-operate with any and every organization having for its purpose the advancement of irrigation and the several related hydraulic interests. It has been rendered with the belief that the equipment men's organization is accomplishing a service of distinct value to the industry as a whole, in the district in which it is active, and in accordance with its expressed purposes, one of which is thus stated by its constitution:

"To conduct a campaign of education that the buying public may be made fully aware of the possibilities of our great state under intelligent and thorough irrigation; of the superiority of artificial irrigation to uncertain rainfall and climatic conditions; and of the large returns that proper irrigation equipment may be made to yield."

THE PUBLISHERS of MODERN IRRIGATION have made it plain, in other issues, that the magazine is an independent agent, not controlled in any way by an institution, organization, or individual, but working shoulder to shoulder with every agency whose purposes and efforts run parallel to its expressed objectives. It expects, as it demonstrates its usefulness, to receive the co-operation and endorsement of all such organizations as have common interests, purposes and ideals, and the cordial endorsement of the Irrigation Equipment Association, expressed by its designation of the Magazine as "official publication," is one very concrete indication that its expectation is justified.

Mr. Brown, president of the Petroleum World Publishing Company, is the man whose interest in irrigation affairs led him, some four years ago, to a recognition of the opportunity for a magazine such as MODERN IRRIGATION — one which would serve the great industry which is concerned, directly or indirectly, with the practical application of hydraulics to all problems of water supply. His experience in successful publication work gave him at once an insight into the needs for such an enterprise and the opportunities awaiting it. He has accepted with pleasure and thanks the honorary membership extended by the association, on behalf of MODERN IRRIGATION, and has pledged the magazine to continue the work which has justified that signal recognition.

Equipment Association Holds Annual Meeting at Sacramento

Zimansky, Cox and Utley Re-elected to Head Organization Another Year

BY H. ELLIOTT TAYLOR

PRESIDENT C. F. Zimansky will head the activities of the Western Irrigation Equipment Association for another year, as the result of the election held at the annual meeting in September. Joseph H. Cox and C. A. Utley retain their posts as vice-president and secretary, respectively, and J. J. Merritt will act as treasurer. The newly elected executive committee includes J. E. Lundy, V. E. Nittinger, J. T. S. Clark, P. L. Nourse, A. M. Frost, and C. B. Noyes.

A goodly percentage of the membership was present at both the business meeting, which was held at Sacramento during fair week, and the evening banquet at a Sacramento hotel

THE annual report of the president formed the basis for the discussions which featured the business meeting. It briefly reviewed the career of the Association during the past year and laid broad plans for the coming year's activities.

The following paragraphs are some high lights from his message to the organization:

"In general, the methods of the trade average higher, the membership is better informed as to the needs of the trade—more nearly agreed as to policies, and better acquainted with the personality and aims of each other.

"A more satisfactory contact has been established with the state government, the managements of the state and Fresno fairs, the power companies and—in a lesser degree—with the public.

"During the year there has been a net gain of members.

"We have now reached a considerable degree of agreement on the subject of well testing and return of used equipment, but still have pending such important matters as the standard guarantee, sales contract and switchboard, on all of which some progress has been made and more rapid progress is probable.

"The major problems now confronting us are: curbing the cut-throat price war, and increased publicity for our work, aims and ideals.

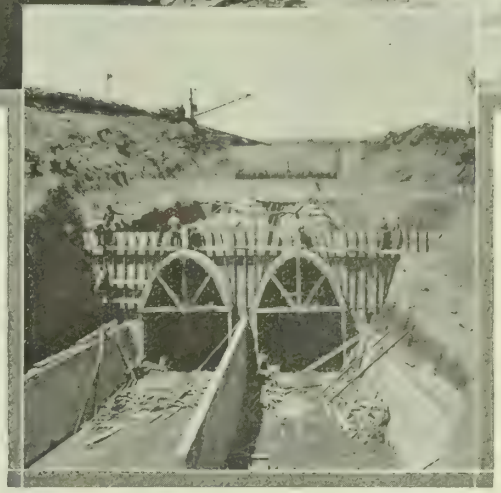
"A reasonable profit is legitimate, ethical and absolutely necessary for the continuance of the industry.

"Increased publicity is one of our

(*Continued on Page 49*)

C. A. UTLEY

Field Engineer for the Pelton Water Wheel Company, re-elected Secretary of the Association at the annual meeting.



Dallas Builds for a Greater City's Needs

Garza Dam Will Provide Water For Municipal Use and Irrigation

By R. A. THOMPSON
Water Reservoir Engineer

ABOVE—*The Concrete Spillway, 560 feet in length. It will contain about 24,000 cu. yds. of concrete.* BELOW—*Concrete conduits built to handle flood water during construction and later to pass stored water to Dallas.*

BECAUSE Texas has no mountain sources of water supply of consequence, dependence must be placed in the normal flow of streams and the impounding of flood waters to provide for municipal requirements, irrigation, etc. While some artesian supplies are available, these are limited both in extent and productivity. Flood water is abundant and there are many favorable sites for storage dams on the principal streams.

A very marked movement is under way at the present time, supported by the state and other conservation agencies, to locate and develop a number of large reservoir sites for purposes of flood control, municipal supply, power and irrigation. The Wichita Falls project recently completed at a cost of $4,500,000 is the pioneer enterprise of its kind in the State and not only provides for the needs of that city but will furnish ample water for irrigation of more than 100,000 acres in the Wichita River valley.

PHENOMENAL growth in the population of Dallas, Texas, which increased from 138,000 in 1920 to 210,000 in 1924, has demanded a very substantial enlargement of the municipal water supply to meet both present and future needs. An exhaustion of the storage in the present reservoirs, which amounts to about seven billion gallons, has already been threatened upon several occasions of extended drought.

In 1923 a bond issue of $5,000,000 was voted to provide an additional water supply. After careful examination of all practical sources it was decided to construct a storage dam on Elm Fork of Trinity River, about 30 miles northwest of the city at a site near the town of Garza. With the available funds it was found that a dam could be built to form a reservoir of capacity 193,000 acre feet, or 63,000,000,000 gallons, which would amply provide for the needs of the city until its population reached 700,000. The drainage area is 1100 square miles, upon which the annual rainfall averages about 35 inches.

THE GARZA Dam, now being built by the city of Dallas, is of the hyrdaulic earth fill type, about 2 miles long and of a maximum height of 80 feet. Contract was let for the construction in August, 1924, and the structure is at present (September, 1925) about 50 per cent completed. Its cost will approximate $3,250,000. The lake formed will cover an area of about 11,000 acres at spillway crest—sea level elevation 525.

The embankment will contain 2,000,000 cubic yards, all of which, with the exception of about 150,000 square yards will be placed with an electrically operated suction dredge having a capacity of about 200,000 cubic yards per month. The 20 inch dredge pump is directly connected to a 1600 H.P., 2300 volt alternating current motor which discharges through 20-inch welded steel pipe on to the dam.

MATERIAL for the fill is obtained from borrow pits immediately above the dam and is a stiff alluvial clay with occasional pockets of strata of sand and gravel. This clay, while difficult to excavate and at times reaching the fill in the form of balls from ⅛ to 10 inches in diameter, is well suited for the purpose. The levees on each side to hold the successive layers or lifts of embankment average from 3 to 4 feet thick and are built up with 2 P. and H. drag lines with material from the center as the work progresses. A temporary dam was built across the channel, prior to the completion of the conduits, to form a lake within which to launch and float the dredge.

The dam is 30 feet wide on top and will carry a graveled highway. Both upstream and downstream slopes are 3 to 1, the latter, however, will be modified to admit of two 8-foot berms being placed 20 and 50 feet respectively below the top of the dam. The drainage on these berms will be led into concrete catchment basins which will discharge through 8-inch tiles well outside of the toe of the slope.

The upper slope of the embankment will be protected with 12 inches of hand laid Stringtown, Oklahoma, chert lime-

stone up to elevation 507.5. From this point 18-inches of limestone will be used up to elevation 532.5 and thereafter 12 inches to top of dam at elevation 540. All riprap will be underlaid with an 8-inch gravel blanket.

ALONG the center line of the dam for its entire length a core trench has been excavated to and into the impervious shale beneath except across the river valley where the shale was too deep to reach with an open trench. Here the excavation was made from 25 to 30 feet deep to ground water level and in the bottom a single line of interlocking steel piling (Carnegie Section M-104) weighing 35 pounds per square feet was driven to shale. The piling varied from 14 to 45 feet in length and was permitted to stick up a minimum of 6 feet in the trench and was subsequently encased in the puddled core placed by the dredge. A total of 121,925 square feet (2134 tons) of piling was driven.

The core trench, usually 12 feet wide at bottom with side slopes of 1 to 1, varying from 6 to 33 feet in depth, was excavated with an electrically operated Bucyrus Class 24 drag line, having a 5-yard bucket and a 100-foot boom. This machine was worked in 8-hour shifts and averaged about 200 cubic yards per hour.

To control the flood water during the construction period, reinforced concrete conduits have been built in a notch cut in the shale bank immediately south of the river channel. These consist of two oval shaped barrels of a total length of 465 feet, including inlet and outlet, and having a vertical (major) diameter of 19 feet and a horizontal (minor) diameter of 14 feet. The bottom of the conduits are at the same elevation (460) as the present river bed. They contain about 4,800 cubic yards of concrete and will discharge 12,000 second feet under a 44 feet head, which will be sufficient to carry normal floods.

AFTER completion of the dam, in order to pass the water from the reservoir down the river channel to the settling basins and filtration plant of the city below, double concrete plugs will be placed in each conduit barrel and through these will be installed in each barrel, 2 lines of 48-inch cast iron pipe. The discharge through each pipe will then be controlled by two 48-inch single gate valves. Also in one barrel one line of 18-inch pipe will be installed having two 18-inch valves. These valves will be hand operated on top of the dam through a concrete tower extending from the gate chamber below.

On the high ground a few hundred feet south of the river channel a concrete spillway is under construction, 560 feet long and of the O. G. gravity type section. The crest is at sea level elevation 525, 15 feet below the top of the dam. The main body of the spillway is from 20 to 25 feet high and rests on a stratum of hard blue impervious shale. It is connected with the concrete apron below with a slab 4 feet thick and resting on a slope at the top 2¾ to 1, and increasing to 1¼ to 1. The floor of the apron is at elevation 457, 3 feet lower than the river bed and 68 feet below the spillway crest. It is protected on the outer edge with a concrete cut-off wall extending 10 feet into the shale.

R. A. THOMPSON

MR. THOMPSON is a consult-engineer who covers a big field, both technically and geographically. He is a member of the water-reservoir engineering firm of Nagle & Thompson, Dallas, and of the recently formed firm of Thompson and Butler, Consulting Engineers, San Francisco. Through his connection with the Dallas firm he has been in charge of preliminary investigations and construction work on the Garza Dam.

The highway will be carried over the spillway on four 139 feet steel spans.

At the extreme south end of the dam are two low sections in the ridge, one about 600 feet wide and the other about 1,000 feet wide, 5 and 4 feet below the spillway crest respectively, through which the flood water will be discharged in the case of unusual and extraordinary rises. The discharge of the service spillway at elevation 535, 5 feet below the top of the dam, will be 58,000 second feet and this approximates the greatest flood of record on this drainage.

THE GARZA dam will be completed early in the summer of 1926. A lake will be formed 11 miles long and averaging 1½ miles wide and 18 feet deep. When a greater storage is desired the capacity of the reservoir can be increased from 63,000,000,000 to 70,000,000,000 gallons by the installation of 2 feet flashboards on the service spillway crest.

The reservoir basin will submerge highways to such extent that the reconstruction of about 25 miles of road will be required to lead them over the dam at the south end of the reservoir and over a causeway to be built near the north end. About 30 miles of telephone line must be rebuilt and some 2 miles of natural gas main relocated. The main line of the Texas and Pacific Railway which crosses the north end of the reservoir will be required to be raised about 5 feet for one mile across the valley to place it above the probable high water lines.

The project has been carried forward under the present administration of the City of Dallas of which Louis Blaylock is mayor. Both the preliminary investigations and the construction work are in charge of J. C. Nagle and R. A. Thompson as chief engineers. O. N. Floyd is principal assistant engineer and T. C. Shuler, resident engineer. The contract for the entire construction was awarded to the W. E. Callahan Construction Company of Dallas, Texas, general contractors. The Puget Sound Bridge and Dredging Company of Seattle, Washington, has the sub-contract for the hydraulic fill.

The illustrations appearing on the preceding page give just a hint of the magnitude of the construction work which is now going on. At the left end of the larger picture working on the inclined surface of the spillway, may be identified three tiny figures—workmen whose infinitesimal proportions in the photograph are in interesting contrast to those of the task on which they are engaged. In the lower photograph are shown the two oval conduits which are now serving to handle flood water, and after the completion of the work will pass stored water from the reservoir down the river channel to the filtration plants and settling basins of the city. These conduits required 54,000 cubic yards of excavation.

"The Columbia River Basin, under the program of development on which your Inland Empire is bent, will be made the seat of a greater, incomparably richer and more varied empire of industry and agriculture, than was the Egypt which served as the granary for imperial Rome."—WARREN G. HARDING.

ABOVE—*The proposed dam site, where an impounding lake will be created if the plans of the project are eventually worked out as contemplated by the Columbia Basin Irrigation League.*

BELOW—*The Washington desert. A typical desert spot in Washington, illustrative of the sort of land which the League seeks to reclaim to productivity and fertility by water from the Pend Oreille River.*

This is the "Scheme of Development Upon Which the Inland Empire is Bent"

A Statement of the What and Where of the Proposed Columbia River Basin Project

By FRED A. ADAMS

Secretary, Columbia Basin Irrigation League

THE COLUMBIA Basin Irrigation League, composed of representative business men of the four Pacific Northwest states—Oregon, Washington, Idaho and Montana—is, with government and state approval, urging the development by irrigation of approximately two million acres of arid land in the state of Washington.

The area proposed to be irrigated is a great pear-shaped block of land embracing about 3,000 square miles in the counties of Grant, Adams, Franklin and Walla Walla. Its western boundary is formed by the Columbia River and a portion of its eastern boundary by the Snake River. First proposals to utilize the waters of the Columbia by pumping lifts were later discarded in favor of a gravity system. This was found to be feasible by bringing the water of the Pend Oreille River in Idaho by large concrete lined canals to the area to be irrigated.

ESTIMATES of the cost and engineering work contemplate a complete and permanent project. There will be 40 miles of natural and artificial lakes, 34 miles of tunnels and 60 miles of concrete lined canals and steel syphons.

To reclaim this vast area it is proposed to store the drainage waters coming from 25,000 square miles in the northern Idaho and western Montana watershed of the Rocky Mountains. Initial storage will be obtained in two large lakes in Idaho—Pend Oreille Lake and Priest Lake.

The point of diversion for water is on the Pend Oreille River at Albany Falls, 50 miles northeast of Spokane.

The average annual flow of this river is 19,000,000 acre-feet—larger than the mean annual flow of the Colorado River.

After six years of continuous investigation by government, state and private agencies the Columbia Basin project was found to be both economically and physically feasible by federal engineers. The report of this board has just been submitted to the Columbia Basin Irri-

gation League trustees. The engineers' report concludes that:

The irrigation of 1,883,000 acres of first class agricultural land is feasible by use of a gravity system, supplemented with short pumping lifts.

AMONG important conclusions reached by the board of federal engineers are:

"The board is convinced from its own study and a review of all previous reports that the project is physically feasible. That the cost of land and water will be less than on many projects where the land is held in private ownership. That it is less than that of most irrigation districts privately financed. That the project is as attractive economically as the better projects already built and those recently approved by the United States Bureau of Reclamation."

Hervey Lindley, of Seattle, president of the league, at a meeting in Portland recently said:

"By bringing the water of the Pend Oreille River to the arid lands of the Columbia Basin, this great project in the state of Washington, when developed, will add $180,000,000 a year to the productive wealth of the nation.

"It is conservatively estimated, using as a base the wholesale value of manufactured products shipped to various irrigated sections in the Pacific Northwest, that the Columbia Basin's annual purchasing power for manufactured products will be from $150,000,000 to $160;000,000."

IN A PROJECT of such stupendous size as the Columbia Basin adequate transportation facilities are necessary. Efficient transportation facilities already exist on the project.

Five main line railroads, four of which are transcontinental systems, traverse the area with a total trackage of 498 miles. Transportation outlets are also afforded by the Columbia and Snake Rivers to the Pacific ocean. Many markets lie at the door of the irrigable area. Portland, Tacoma, Seattle and Spokane are but a few hours' distance by railroad. There is direct connection to Canada and California. The water outlet to coast ports places the Oriental and Alaskan markets within reach, while the Panama Canal will enable the Columbia Basin producer to market his products on the Atlantic coast expeditiously and profitably.

"Every effort is being made to prevent speculation in these lands," says Mr. Lindley. "If the Columbia Basin project is to attain the maximum ultimate measure of success, settlers must get tracts at present land values plus the cost

(*Continued on Page 41*)

Oregon Irrigation Congress in Successful Meeting

IRRIGATION finance and the political side of irrigation and reclamation developments in Oregon were the dominant topics at the Oregon Irrigation Congress, meeting in its fifteenth anniversary session at Grant's Pass, Oregon, October 5, 6 and 7.

James M. Kyle, president of the Congress, opening the convention of irrigationists, criticized the policies of the national reclamation bureau, and emphasized the importance of settling the arid lands of the state.

JAMES M. KYLE

"If irrigation is to grow and prosper," declared Mr. Kyle, "it must be through the peopling of our arid lands."

Irrigation, he asserted, is not a failure; but in some cases financial policies have been mistaken, and refinancing is required. He advocated irrigation in the Willamette Valley, opposed the proposal for a $40,000,000 bond issue for public power development, and the state law guaranteeing interest on irrigation bonds of approved projects, suggesting a fund of one million dollars for state aid and direction of irrigation on state projects, but opposed state aid on federal projects.

He vigorously condemned land speculation as an undesirable feature of irrigation developments, saying: "In so many cases sagebrush land that was not worth over $2.50 up to $10 an acre was sold as high as $200 and in a few cases as high as $500 per acre, and then the settler expected to pay in addition the cost of the water. Is there any wonder that some settlers could not make good?

"The time has come when something must be done to refinance some of our projects. Let us get some of the big men of the state interested in this. Let them get together men trained in financing large undertakings, give them all the assistance needed, let them work out a program—then let everyone get behind it and put it over, cut out all the water except that which is put on the land, for it is only water that will grow crops."

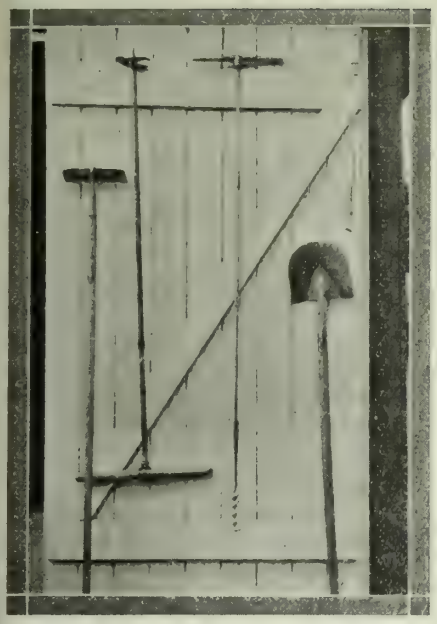
Senator Charles L. McNary, on the opening day of the convention, delivered a speech in which he scored the Reclamation Bureau's administration of reclamation projects in Oregon.

ON THE SECOND day of the congress, the visitors were taken in a great caravan on an inspection tour of the Rogue River Valley to observe the results of irrigation there. The delegates were guests of Grant's Pass at an evening banquet at which Governor Pierce of Oregon was the principal speaker.

Visitors from many parts of the west attended the Congress. Among the speakers were George C. Jewett, president of the Federal Farm Loan Bank of Spokane; John Dwight Neale, of San Francisco; W. W. McLaughlin, of Berkeley; Hervey Lindley, of Seattle, president of the Columbia Basin Irrigation League, and several other prominent authorities on irrigation from outside of the state.

Oregon irrigationists who addressed the congress included President James M. Kyle, of Stanfield; Secretary Walter E. Meacham, of Baker; Rhea Luper, State Engineer; H. M. Chadwick, Assistant State Engineer; W. L. Powers, of the Oregon Agricultural College; Senator McNary, Senator Stanfield, I. L. Patterson, George Wilbur, Marshall N. Dana, Franklin T. Griffith, and others.

One of the interesting developments of the Congress was the sentiment in evidence in opposition to the Oregon law which guarantees the interest on irrigation bonds of approved projects.



Try this on your barn-door. One irrigator finds that having his tools thus arranged means convenient accessibility, and a continual reminder that a soil moisture test can hardly be made too often.

Are *Your* Orchard Trees Getting *Optimum* Moisture?

An Expert Discussion of Factors Influencing Soil Moisture Control in Fruit Growing

By MARVIN B. ROUNDS

Acting Farm Advisor, Los Angeles County, California

OF THE SEVERAL fundamentals recognized as most important in the production of fruits none is more important than proper soil moisture regulation.

Production and profit are probably governed more by the water supply than by any other one factor. When conditions are such that the plant or tree is not furnished with a constant supply of available moisture, wilting takes place, the tree declines—and finally dies, if this condition is of long duration.

The water content of plants is about 75 per cent or more. Some parts of the plant, such as the fruit, contain more moisture than other parts. Leaves and recent growth contain more water than old wood. Water is constantly passing off from the green portions of the tree, especially the leaves. The tree is consequently receiving water, and, if rigidity is to be maintained, water must be supplied from the soil through the roots. Further, water must be constantly supplied to the tree in order to transport mineral material from the soil to the leaves to be made into plant food. Not only does this mineral matter go into the food products manufactured in the tree, but some of the water itself furnishes a portion of the organic compounds manufactured, and is necessary as food to the plant.

Water which passes up from the roots into the several tissues of the plant is usually in excess of that necessary for the use of the tree, and it is passed off through the leaves and other green portions into the air. Transpiration, as this process is called, is necessary to the tree also to regulate the temperature of the tissues of the tree. Several factors are involved which tend to decrease and increase the transpiration rate. Three important factors are temperature, humidity and velocity of wind. These three factors involved in transpiration frequently govern the kinds of crops which can be produced and the varieties of certain plants which may be grown in a certain locality. Plants adapt themselves to the atmospheric or climatic conditions. Some varieties of plants have leaves which differ greatly from others in that they can withstand certain atmospheric conditions which increase transpiration, giving off very little moisture when the giving off of excessive moisture would mean the death of the plant. Some plants are adapted to humid climates and have leaf surfaces which transpire a great deal of moisture. Rates of transpiration vary, being much greater in interior sections of the west than in coastal regions.

IT IS ESTIMATED that on the average about 500 parts of moisture are required to produce one part of dry matter. Of course, there is considerable variation with respect to this figure in plants, more succulent plants such as alfalfa and cover crop plants requiring much more than this. If we use this figure 500 as approximately the number of parts of water required to produce one part of dry matter in orchard crops, it has been estimated that for a nine year old peach orchard, 11-acre inches of water evenly distributed would be required for growth and the production of fruit. This does not take into consideration any loss through run off, evaporation from the surface, or too deep penetration, but considers only that used by the tree. Further, it has been estimated that about one-third of the water actually applied to the soil becomes available, and that the balance is lost. This peach orchard then would require an application of 33-acre inches of water to fulfill all requirements. Probably a mature citrus orchard would require even a greater application.

OBVIOUSLY, an adequate supply of irrigation water should be obtained and an effort made to conserve as much as possible of that applied. How can conservation be accomplished? In general: First, by having the surface soil in the proper physical condition; second, by proper distribution of moisture throughout the root feeding area; third; by preventing too deep penetration.

To be specific, proper physical condition of the surface soil means that it should be loose with no plow sole or hard stratum just below the surface. When this condition exists water will be more quickly absorbed and proper penetration accomplished.

Proper distribution is effected only when the whole root feeding area of the soil is moistened. In many soils, if water is applied to only one-half of the soil surface, not much more than one-half of the soil obtains water. This limits the root system because of the fact that roots cannot develop and obtain nutrients in a dry soil. An even distribution of roots is the ideal.

If water is applied in amounts so that it penetrates the soil much below the feeding roots it is wasted for it will not come up again and become available to the tree.

WATER in soil is recognized in three forms; free, capillary and hygroscopic. Free water is that which when applied passes down through the soil mass by force of gravity, wets all soil particles and finally is absorbed or passes away in the country drainage. Capillary water is that which is absorbed by the soil and remains as a thin film clinging to the soil particles. Hygroscopic water is that which is retained by the soil when it is air dried but varies from 2 to 10 per cent of the weight of the soil.

GRANT IN L. A. EXAMINER.

This newspaper artist visualizes, in graphic style, the immense power of the Colorado River, awaiting development. The Examiner is a supporter of the much discussed Swing-Johnson Bill.

Governors Declare Attitude of Upper Basin States

Demand Protection of Rights Before They Will Consent to Development of Lower River

SENATORS comprising the sub-committee of the Senate Committee on Irrigation and Reclamation, which will meet in October to make a close and intimate study of the problems of the Colorado River Basin, pursuant to authorization from Congress, will have something definite to masticate—and another kink to iron out of an already complicated situation—in the shape of the joint resolution promulgated by the governors of Colorado, New Mexico, Utah, and Wyoming at their recent all-day conference.

The attitude of the four upper-basin states is supposed to be set forth in the statement of the governors' conference, and its import was a declaration of opposition to any developments on the lower Colorado for purposes of "flood control, power development, or any other uses", until the interests of the upper states are protected by compacts between all the states interested.

The joint resolution was addressed by the governors "to the people of Colorado, New Mexico, Utah and Wyoming", and begins by a general statement of the situation on the Colorado River and an explanation of the reasons why the statement is demanded. It declares:

"The Colorado river rises in the states of Colorado, New Mexico, Utah and Wyoming. The are arid and the first use of the waters of the river is essential to the growth, development and the general welfare of our states. The construction of enormous works on the lower river which might give rise to assertions of claim to monopolistic and exclusive use of our waters, would be destructive of our institutions and inimical to our welfare unless adequate protection is provided in advance of such construction. The Colorado river compact affords this protection. It protects the future development of the upper states without injury to the states of the lower basin and permits immediate construction of necessary flood control works on the lower river without resultant injury to the upper states. Its provisions are fair and just. Our legislatures ratified the compact, but for reasons of interstate comity, we remained silent that the states of Arizona and California might conclude their discussions. But conditions now demand that we speak lest our silence be misconstrued."

THEN FOLLOWS a chronological summary of the attempts of the Colorado River states to reach an agreement which would permit the development of the river for the primary purpose of flood control. Beginning with the disastrous break-over of 1905, when the Colorado flowed through the Imperial Valley into the Salton Sea, and following through the various meetings, conferences and deliberative assemblies which have taken place since that date, the resolution touches briefly on the important conferences at Salt Lake City in 1919, in Los Angeles and at Denver in 1920, at Riverside in 1921, at Denver in 1921, at Washington in the same year, and the meeting at Santa Fe, New Mexico, on November 24, 1922, when the Colorado River Compact was drawn up.

"The failure of the Arizona legislature to approve the compact prevented flood control," says the statement. "The states of Colorado, Nevada, New Mexico, Utah and Wyoming, by action of the 1925 sessions of their legislatures, offered to avoid further delay by the concurrent enactment of uniform legislation by the six ratifying states to provide that the compact should be effective between the states of California, Colorado, Nevada, New Mexico, Utah and Wyoming, when the six named states should have enacted such legislation, without awaiting action by Arizona. But the state of California failed to agree, thus preventing the compact from becoming immediately effective, thereby again delaying construction of flood control works.

"The states of the upper basin, with promptness and without reservations, have passed every measure essential to make the Colorado river compact effective and flood control and other development immediately available. But our proffers of co-operation and good will have been ignored; our silence has been misconstrued; threats of groundless litigation against us are being made to secure the construction of enormous works along the lower river without our consent and without regard to our future necessities and the welfare of our commonwealths.

WE STAND now, as we have consistently stood throughout all negotiations, for prompt action that will provide adequate flood control in the lower basin of the Colorado river, but, as an economic proposition, such flood

(Continued on Page 53)

Equipment Dealers Face Knotty Problems In Handling Used Pumps

Committee of Three Association Members, Appointed to Investigate Matter, Advocates Strict Limitations on Both Manufacturers and Retailers

By HUGH CRANE

USED pumps, and used equipment in general, bid fair to become the same sort of a disturbing factor in the irrigation equipment industry that the used or second-hand car has proved to be in the automobile industry. It is a problem of importance not only to the manufacturer who makes the pumps, and the retailer, who sells them, but to the irrigator, who uses them, as well. Just as the consumer in the automotive world is concerned in having the sale of used cars regulated by some reasonable and equitable restrictions, which guarantee safety to the buyer while protecting the dealer from unscrupulous competition, so the irrigator is interested in the rules—or the lack of rules—governing the return and re-sale of used equipment.

The Western Irrigation Equipment Association, of California, has determined to make a careful study of this problem, with a view to working out some solution that will afford this dual protection to both buyer and seller. E. M. Breed of San Francisco is chairman of a committee, recently appointed to investigate the whole matter, and his recommendations, as presented in the committee's report to the association, are based on many hours of thought given to all aspects of the situation.

The Committee's Report

The following is the report submitted by Mr. Breed as chairman of the committee appointed by the Western Irrigation Equipment Association to study and report on the problem of used equipment:

Mr. President, Gentlemen:

Our investigation indicates very clearly that the situation involved is not one that presents the same problems to all of our members and it is therefore the belief of your Committee that separate recommendations should be adopted by the Association as applying to dealers and manufacturers.

Obviously, it is often to the advantage of the dealer either to buy in used equipment or to make a legitimate allowance on used equipment as partial payment on new machinery. Transactions of this type undoubtedly provide a considerable source of revenue to many of our dealer members when handled on the basis of the actual value of the used equipment and not on a false value stimulated by competitors.

On the other hand, the accepting of the return of used equipment or the sale of so-called reconditioned equipment by a manufacturer in order to increase sales, can only lead to the lowering of the high standards which this Association was originally formed to maintain and a loss of faith in the products of such a manufacturer by the buying Public.

It is undoubtedly a fact that pumps which have been operated for any length of time under field conditions or which have been used in the testing of new wells where sand is always encountered, can never, even after careful reconditioning, be considered the equivalent of new equipment.

Your Committe therefore recommends that this Association go on record as being definitely opposed to any manufacturer member accepting the return of used equipment for any reason whatsoever, except where the equipment is proven to be defective or where it is found necessary to replevin the machinery.

Your Committee further recommends that the Association go on record as opposing the sale of reconditioned machinery by any manufacturer member unless the purchaser of such machinery is fully advised of the fact that the equipment has been reconditioned. *Respectfully submitted,*

E. M. BREED.

ILLUSTRATING the crux of the whole used equipment problem, as found in the irrigation country today, the following story, related by a California pump manufacturer, tells how a typical sale may be made under existing circumstances.

"Let us suppose," he says, "that Mr. Jones, a well-known irrigator of your territory—or perhaps of mine—decides that he needs a new pump. He resolves to spend no more than necessary for the equipment, and remarks to Mrs. Jones that he is going to go to town himself 'to see about buying a pump.'

"This is what he means when he says that he will *see* about one. He means that he will call on a few of the supply houses and possibly on a manufacturer, and tell each one, in a friendly and confidential way, that he is in the market for some new equipment. By such a process he will get all the prices available, select from them the lowest that he feels he can trust, and with that particular firm will open negotiations leading to a possible sale.

"Now there is nothing wrong about his manner of proceeding. But there is something decidedly wrong in the result which it leads up to, and it is something which, in the long run, will be as disastrous to the irrigator as it is sure to be to the equipment dealer.

"Jones' friend, Johnson, one of the dealers whom he approaches, makes him a price of $2000 for the outfit which he requires. Johnson wants to make the sale, and gives the prospective customer the best possible price at which he can be sure of a small profit.

"Jones meditates a little while when this sum is named, but finally says: 'Well, I'll tell you—I guess I'll take that offer if you will treat me right on my old pump. It's still in fine shape, and you fellows can clean it up and sell it for new.'

"Right here is where the saddest part of the sad story comes in. Jones hadn't mentioned a trade-in when broaching the proposition. Johnson had put his price down at bed-rock, hoping to clinch the sale. But Johnson decides, finally, to allow the customer $200 on the old equipment, feeling that the second-hand dealer will pay him that much for Jones' old pump and the fittings that go with it.

"'Two hundred isn't enough,' declares Jones. 'The Deep Well Pump Company will allow me $300; the Farmer's Friend Supply Company will let me have $360, and I have half a dozen bids that make $200 look sick.'

"There's no use detailing the rest of the transaction. Jones wants to buy from Johnson, but he wants as good terms as he can get elsewhere. Johnson

VOL. I OCTOBER, 1925 No. 4

A Valued Endorsement

IN HIS annual report to the members of the Western Irrigation Equipment Association, President C. F. Zimansky, who was re-elected head of that organization during September, said:

"Our agreeable contact with the new and up-to-date publication, MODERN IRRIGATION, should assist us greatly; and we should assist both it and ourselves by working for its widest circulation."

Following closely upon this expression of confidence, the Western Irrigation Association, through its executive committee, took action recognizing MODERN IRRIGATION as its official publication. The membership of the association, in the open annual meeting, conferred upon Mr. Owen Brown, as chief executive of the magazine, its first honorary membership.

We should be delinquent indeed, if we were to permit these high compliments to pass without acknowledgment. MODERN IRRIGATION appreciates sincerely these fine and unsolicited testimonials to the fact that the magazine's undertakings have been launched along the proper lines, and that we are, already, beginning to accomplish some of the things which we set out to do.

To Mr. Zimansky and the Western Irrigation Equipment Association we desire to say that, to the best of our ability, we shall endeavor to deserve their continued friendship and co-operation by working constantly for the welfare of all branches of the western hydraulic industry.

Friends in a Good Cause

AN OPPORTUNITY for greater service to our industry is offered, we believe, by such action as has been taken by the W. I. E. A. The official endorsement of such organizations makes it possible for the magazine to become, in increasing truth, the organized "voice for irrigation"—which is its objective.

There are many other organizations throughout the irrigation country which are working, as is the W. I. E. A., for the best interests of the industry. Many of these, like this association, are concerned first in advancing the welfare of some particular group or in accomplishing some particular purpose; but most of them are sufficiently broad in their vision to recognize the necessity for larger co-operation with other agencies in the field and for a greater correlation between the many factors which enter into the development of the west's water supplies for "the greatest good for the greatest number."

To enumerate only a few of these representative agencies, within the confines of a single state, will indicate how many different forms of bureaus, departments and associations, there are working for irrigation in one or more of its different branches. In California alone, for instance, one may come in contact with such officially constituted federal and state agencies as the Forest Service, the U. S. Reclamation Bureau, the California Bureau of Public Works, the California Reclamation Board, the Department of Agriculture, the Agricultural Extension Service, Flood Control Councils, and the Farm Bureaus. All of these touch irrigation and hydraulic developments intimately and constructively. There are several organizations concerned particularly with the problems of conservation, such as the Conservation Association of Southern California. There are federations of irrigationists whose prime interests are the advancement of the industry, such as the California Irrigation Districts' Association and the California Mutual Water Companies' Association.

There are many special organizations formed to deal with particular problems of reclamation, irrigation or flood control, such as the Sacramento River Problems Conference. There are semi-public associations whose objectives run parallel to these at many points, such as the California Approved Land Settlement Association. There are great commercial bodies whose programs include many water-supply problems as

POINT *Of* VIEW

among the most pressing in the entire west, such as the larger Chambers of Commerce and the California Development Association. And in addition to these there are the technical associations, such as the American Society of Agricultural Engineers, the American Society of Civil Engineers and the American Water Works Association, whose regional divisions are vitally interested in many of the larger problems of irrigation.

And this is but a suggestion of the possible concert of effort that is visible in a single state. Other states have their Irrigation Congresses and Leagues in corresponding numbers.

We enumerate these simply to show that there is a great array of associations devoting their efforts to the advancement of the hydraulic industry. Every one of these has its proper place and function. And each one of them can, if it will, find a source of willing assistance and co-operation in MODERN IRRIGATION. This magazine has been established for the service of the entire industry, and to that end is ready to lend its columns to each and every one of the organizations in the west whose activities contribute to that service.

Able Allies of Irrigation

COMMERCIAL bodies such as chambers of commerce and development associations are accomplishing for irrigation some of the most important work that is being done in its interest. And this is not confined to the organizations serving the largest cities, such as Los Angeles or Portland, but is shared in by many smaller communities.

Chambers of Commerce of Ventura County, California, co-operating with the county farm bureau and agricultural extension service, recently arranged a tour on which thirty ranchers were taken into canyons in Los Angeles County, where notable conservation work has been done with check dams.

Chamber of Commerce executives of The Dalles, Oregon, recently headed a party of engineers and orchardists on a comprehensive tour of the watershed of Wasco County, as the finale to a complete survey made under the auspices of their organization, dealing with the potential irrigation resources of that section.

The Realty Board and Chamber of Commerce of La Grande, Oregon, are co-operating in planning an excursion of farmers and business men of that section into the Yakima Valley, there to see what irrigation is accomplishing.

During the latter part of September, a commercial organization of San Francisco devoted an entire week to conferences and hearings on problems of forest protection and water-supply.

All these things are suggestive of what is being done and what may be done in the interest of irrigation by organizations far sighted enough to recognize the importance of irrigation to the entire community. They illustrate how one of the industry's great problems is being partly solved—the problem of educating the public to what irrigation means.

Educating the Public

IRRIGATIONISTS have long recognized this as one of the chief obstacles to the proper protection and development of our water resources—the lack of a link between the informed man, whose contact with the practical affairs of the industry have shown him what ought to be done, and the uniformed public upon whose franchise the adoption of one course or another must often depend.

Of course, to reach the masses with the truth about this or any other subject is a hopelessly discouraging task. The "man in the street" is usually in that category, generally speaking, because he either hasn't the intelligence or interest required to understand the practical side of many matters that concern him only indirectly. But the chambers of commerce, by their wakening and increasing interest in affairs of irrigation, are welding a link between the industry and alert and thinking business men which will prove the most valuable extension of irrigation knowledge that can be gained.

The business man, no matter how he may be derided by the so-called intelligentzia, still exerts a disproportionate—possibly a controlling—influence on the political and financial affairs of the nation. And if the business man may be brought to see irrigation (including water developments of every kind) as the absolute necessity of his community and his business, upon which both must depend for their prosperity—which in most western localities it assuredly is—we need not worry so much about what is going to be done with our forests, our rivers, our flood waters and our other resources. It will not solve all our problems, to be sure, but it will help immensely.

A Note of Pathos

WE WERE reading, the other evening, that entertaining and informing essay on "The Senate of the United States" by the master of expository prose and old-school statesmanship, Henry Cabot Lodge. The upper house of our national Congress, points out the late Massachusetts senator, is not only "the greatest deliberative body in the world," but with one exception—the English House of Lords—is the oldest. Moreover, the senate is the most stable and enduring institution of our government. It never dissolves; it is continuous. New administrations come and go, the House of Representatives must be newly organized, but the Senate goes on. The Senate of today is the same body, in point of continuity of existence, that heard Webster thunder his reply to Hayne, and Thurston urge the liberation of Cuba. There is pathos, therefore, in the reflection that our national Senate, upon all too many occasions, has age without dignity, and power without respect.

Washington Sentiment Divided Over Report on Columbia River Basin Project

Comments of Editors Run Gamut From Zealous Advocacy to Intolerant Condemnation of Plan

By THE DITCH-RIDER

WASHINGTON newspapers are apparently loath to set up their editorial judgments against those of the reclamation experts who have declared against the development of the Columbia River basin project by the federal government. In the comment elicited during September by the report of the special investigating commission, submitted to Secretary Work, declaring that the project is physically feasible, but that the time has not yet arrived for its development, several journals of the state voice their belief that the project should be carried forward in spite of the report; but most of them either are noncommittal or frankly approve of the Commission's findings.

Several editors state with apparent regret that the adverse recommendations are "disappointing"; others note prominently in their news columns that the Columbia Basin Irrigation League will bring the project before Congress in an attempt to secure action independently of the Interior Department heads; while others point out that the disapproval of the Commissioner of Reclamation and the Secretary of the Interior is not necessarily fatal to the plan. Several other papers find in the report of the investigators an official justification for their own failure to champion the plan, or their opposition to some of its features.

ONE of the newspapers which call vigorously for the construction of the project in spite of the unfavorable report is the Walla Walla *Bulletin*, which asserts:

"The report . . . is undoubtedly a setback for the big reclamation scheme, but it is by no means the last word thereon. It simply represents the present ideas of two department chiefs. . . . They found the project feasible, which is a big victory for the men who have long labored in its behalf, but they stated the time is not yet ripe for the federal government to take hold of it . . . No one has ever disputed the fact that the project would cost a large sum of money and that its settlement would be a difficult problem. . . . The fundamental question at issue, however, is whether the present rate of agriculture production warrants addition of such a large body of land to the farming area of the country. . . . The weight of expert opinion seems to be that the population of this country and of the world is increasing rapidly enough to justify steady advances in production. . . . The people of this state and of the Northwest would not want the Columbia Basin project built if it was not feasible, but since its latest and highest critics have pronounced it feasible, they believe it ought to be constructed. . . . Congress should disregard the 'watchful waiting' report of Messrs. Mead and Edwards, therefore, and make a start on the Basin project. . . The Columbia Basin League and the people of the great Inland Empire should keep right on fighting to secure the building of the project. They will win in the long run."

ANOTHER Walla Walla paper—the *Union*—agrees with its contemporary, and quotes with approval the statement of Roy R. Gill, chairman of the Board of Trustees of the Columbia Basin League, that "we have known all along that we would have to look to Congress and not to the Secretary of the Interior's office to build the project." The *Union* believes: "There is no need to become agitated over this matter. . . . Backers of the plan . . . are slowly gaining ground. . . The fight will go on and eventually will be won. We should feel encouraged, not discouraged, by the report."

The newspapers of Everett, Washington, are luke-warm in their reception of the investigators' report. The Everett *News* says: "The report will be disappointing to those interests in eastern Washington who have visualized for years the great expanse of arid land turned into rich orchards and prolific agricultural tracts producing enough to feed half the cities in the United States with an overflow for export." Then, pointing out some of the features which made the government chiefs naturally hesitant to commit the Reclamation Bureau to its construction, the *News* looks forward to the future realization of the Basin project by saying:

"However, the state has the land, which no one can carry off, and it has the rivers and lakes, which also will be there 25 or 50 years hence. So that while the development has run into a snag it is bound eventually to come with the steadily increasing population of the nation and the added need for producing acreage."

The Everett *Herald* is frankly scornful of statements which it quotes from several United States senators favoring the Basin project, one of which is credited to Senator Cameron, of Arizona, as follows: "It doesn't make any difference what Work and Mead think. The United States has money to develop such projects as the Columbia basin. Therefore why not do it now? Take the bull by the horns. Go out and get the money and put it over right now."

The *Herald* ironically says: "That's the stuff. Expand because we have the expanding habit. Spend the money because we have it to spend. Let's go, put it over, and all that sort of thing. It really doesn't matter that many irrigation projects the government has taken up are in arrears and that irrigated lands right now available are not properly utilized and that, under the circumstances, men who have examined the Columbia project believe it presents too many complications to be undertaken at this time. Expert knowledge doesn't mean much to some of our statesmen.

"All of us are not enamoured of many of these federal bureaus. Frequently their experts presume too much. They calmly assume legislative functions and we can't blame senators and even the common people if they protest occasionally. A bureau decision or an expert's opinion is not an unalterable fiat and yet such decision cannot with any degree of good judgment be altered by such logic as propounded by these senators from the Great West."

THE Yakima *Republic* wants the reclamation activities of the federal government to be concentrated in the Yakima Valley, and it condemns the Basin project without reservation and in somewhat intemperate language: "Frequent gatherings of citizens who from time to time indorse the proposal (the Basin project) . . . do not, as a rule, know what they are doing

(Continued on Page 35)

THE IRRIGATION DIGEST

A Monthly Bulletin Board of Brief Facts and Events from Far and Near

CALEXICO, CALIF.—One hundred thousand acres of productive land in the Colorado River delta, in Mexico, are to be brought under irrigation by pumping, if plans now undertaken by J. C. Allison are worked out successfully. Mr. Allison now has six wells pumping, and others drilling.

EL PASO, TEX.—Construction work on the Bluewater, N. M., irrigation project is scheduled to be started by October 1st, according to a statement by Vernon L. Sullivan, consulting engineer. Ten thousand acres will be brought under irrigation by the project at a cost of $350,000.

PHOENIX, ARIZ.—The Mohawk Valley Irrigation District has been authorized by the Arizona state certification board to proceed with an election for a bond issue of $500,000 to improve the district. The developments contemplated will involve the drilling of wells to water 20,000 acres.

LONG BEACH, CALIF.—Clark Shaw, city water superintendent, favors the acquisition of more water bearing lands by the city, and advocates in his annual report that such lands be secured close to Long Beach. He also urges the construction of two more reservoirs for the city with a total capacity of 1,500,000 gallons.

SAN FRANCISCO, CALIF.—The California Development Association contributed much to the investigation of conservation problems of the state, including flood control, municipal water supply, and irrigation water, in a week's conference, September 21-26, devoted to these and related subjects connected with the public lands.

ELLENSBURG, WASH.—A board of three members has been named to appraise the land and improvements of the Kittitas highline canal. It includes H. H. Johnson of the soil and economics department of the Reclamation Bureau; Phil S. Olmstead, pioneer Kittitas Valley farmer, and A. J. Turner, engineer of the Columbia Basin project.

FLORENCE, ARIZ.—Headquarters for the San Carlos reclamation project have been moved from San Carlos to Florence. The office which has been maintained at the Sacaton Indian Agency has also been transferred to this city. Diversion dams across the Gila River above Florence and Sacaton have been completed, and a large amount of canal work is now in progress.

WASHINGTON, D. C.—In an opinion rendered at the request of Hubert Work, Secretary of the Interior, Attorney General Sargent has held that the Secretary is not obliged to proceed with the development of the Baker project, which he does not consider economically feasible. Congress having appropriated funds for the project, critics of Work had held that he was obliged to proceed regardless of his own opinion.

IMPERIAL, CALIF.—New offices and shops for the Imperial Irrigation District, which have been under construction here during the past few months, are almost in readiness for occupancy, and the headquarters of the district are expected to be moved from Calexico to the new location before the end of the month. About fifty employees of the district will be transferred from Calexico to Imperial.

GRASS VALLEY, CALIF. — Water rights and other property of the Excelsior Water and Power Company, which have been in dispute between the company and the Nevada Irrigation District, have been purchased by the district, it has been announced from Washington by A. L. Wisker, general manager. The purchase clears the way for the immediate launching of the Nevada Irrigation District's $6,000,000 water and power project, which will affect 140,000 acres of land.

BOISE, IDAHO.—The reclamation district bond commission has authorized the certification of bonds of three eastern Idaho irrigation districts in the total amount of $200,000. The Idaho Irrigation District was certified in the amount of $126,000. The Progressive district's amount was $70,000, and the Popular district asked for only $4,000. All of the funds are to be used for the purchase of water from the American Falls reservoir, it was announced.

SAN FRANCISCO, CALIF.—The California Railroad Commission has granted permission to the Pacific Gas & Electric Company to issue $1,100,000 in bonds for the purpose of starting work on the construction of a $2,530,000 hydraulic plant on the Stanislaus River. The plant will use water from the Melones Dam, now in course of construction by the Southern San Joaquin and the Oakdale Irrigation Districts. The power company will pay the districts a total of $5,175,000.

OLYMPIA, WASH.—Applications have been filed with the state supervisor of hydraulics for the appropriation of water rights on the Quilcene and Little Quilcene Rivers for irrigation developments to cost eight million dollars. Cost of developments on the Quilcene River, entailing construction of twenty-five miles of pipe line, is estimated at $5,000,000, and the Little Quilcene River project, involving the building of a 20-mile pipe line, at $3,000,000. Commissioners of Jefferson County are the applicants.

EL CENTRO, CALIF.—Directors of the Imperial Irrigation District have been attacked from a new source by a demand filed by J. T. Collins, of Calipatria, for the repayment to the district of $53,000 alleged to have been "misappropriated" during the past several years. The funds in question are substantially the same which are involved in the action now pending in the Superior Court of Imperial County, in which Directors Rose, Aten, Brockman and Pound are accused of malfeasance in office. The accusations mainly grow out of expenditures authorized by the district in the interest of the Swing-Johnson bill.

Take Steps to Advance Utah and Oregon Projects

Secretary Approves Contract Forms for Salt Lake Basin and Vale Developments

Distinct progress was made during September in the arrangements for carrying out the Salt Lake Basin project in Utah, the Vale project in Oregon, and the Owyhee project in Oregon and Idaho as a result of the action of Secretary Hubert Work in approving proposals submitted to those interested in these projects.

In the case of the Salt Lake Basin project, a form of contract for the purchase of water from the Echo Reservoir, at a cost of $3,000,000, was approved and will be submitted to the water users who are forming an association to guarantee the repayment of this sum. Under the approved contract the United States is to build a reservoir of 74,000 acre feet capacity, and construct the Weber-Provo diversion canal with a capacity of 300 second feet of water. This contract will be placed before the organization that is forming the association in order that its conditions may be fully understood. It requires that the entire construction cost shall be repaid to the United States within twenty years, and that the United States shall be reimbursed for operation and maintenance expenses during the time the works are operated by the government. The operation and maintenance assessments are to be paid annually in advance. The amount appropriated by Congress for this project during the present fiscal year is $900,000.

The act providing for the construction of the Vale, Oregon, project, as passed by Congress at its last session, contains a provision authorizing the purchase of an interest in the Warm Springs reservoir, and for this purpose appropriated $200,000. A part of this purchase may have to be used to construct a drainage system for the Warm Springs Irrigation District, and if this expenditure is more than $200,000 the district must pay the government the difference. Secretary Work has approved a form of contract for the purchase of an interest in the Warm Springs Reservoir, and this has been forwarded to the local officials of the Bureau of Reclamation, for discussion with representatives of the Warm Springs Irrigation District. Because of legal complications involving the right of the district to convey an adequate interest in the storage reservoir, it is provided in the contract that the Secretary of the Interior may require the district to institute and prosecute a suit to determine the extent of the right to be conveyed to the United States.

Before construction can begin, another contract with the Vale Irrigation District will be necessary, and action by the State of Oregon, showing willingness to comply with a provision of the appropriation requiring the State of Oregon to assume certain duties and responsibilities, in the settlement of land and improvement of farms.

Secretary Work has also approved a draft of a letter to the Gem Irrigation District, and other districts to which water may be furnished from the reservoir and canals of the proposed Owyhee project. This letter proposes alternate plans for the payment of water charges and construction costs, if these districts are provided with water under Warren Act contracts by the Owyhee project.

New Deal Proposed for Strawberry Project

Contract Governing Payment of Debt and Transferring Control Submitted to Association.

A draft of a new contract proposed to be entered into between the United States and the Strawberry Water Users' Association by which the Association will take over the operation and maintenance of the Strawberry project in Utah has been approved by Secretary Work and submitted to the Association.

According to the terms of the proposed contract, the construction charge deficit now existing on this project is to be paid by the Association in 20 equal annual installments and in addition, the Association, by levying assessments on its members, is to collect and pay the government the amount of any deficit in any year when water users fail to pay their construction costs.

Lands Reclassified

Areas of public lands amounting to 6,666 acres in Alaska, Arizona, California, and Oregon were reserved by application under the Federal Water Power Act during the month of August.

More than 70,000 acres of land in Idaho, Montana, and Utah were included in formal orders designating the land as non-irrigable under the enlarged-homestead acts and to that extent subject to entry as homesteads of 320 acres or less. More than 60,000 acres in Idaho, Montana, New Mexico, and North Dakota were classified under the stock-raising homestead law and designated for entry in tracts of 640 acres or less. Much of the acreage involved in these designations is included in original entries or in applications under the enlarged and stock-raising homestead acts which confer a preference right.

Oregon Irrigation Securities Board Refuses Extensions

Denies Applications for Interest Guarantee of Three Districts; Grants Tumalo Extension

The Oregon Irrigation Securities Commission, meeting at Salem, Oregon, in September, received applications from four irrigation districts for an extension of the state's guarantee of the interest on their outstanding bonds, and refused to grant the desired extension on three of the applications.

The Silver Lake Irrigation District applied for an extension of the state guarantee on the interest on $275,000 in bonds for a period of one year. The application was rejected on motion of Governor Pierce, who declared that at a previous meeting of the commission the directors of the district had promised that they would not turn to the state for further financial assistance.

The Eagle Point District applied for an extension of the interest guarantee on bonds totalling $400,000 for a period of one and one-half years. In refusing to grant the extension the board declared that it would be willing to consider arguments in its favor which might be advanced by the directors of the district.

The Lone Pine Irrigation District requested two years extension on the interest on $95,000 worth of bonds and two and one-half years extension on $94,000 worth. Both applications were refused.

The applicaion of the Tumalo Irrigation District for extension of the guarantee for one and one-half years on $650,000 worth of bonds was acted upon favorably, the commission explaining that this district differed from the others in that the state was in a measure responsible for its settlement.

Buy Machinery for Imperial

W. O. Blair, director, and A. L. Graves, master mechanic of the Imperial Irrigation District, have returned from the east after making extensive purchases of shop equipment authorized by the district. By careful buying, according to their announcement, savings amounting to $13,000 were effected in acquiring the machines. The equipment purchased includes: One milling machine, $1,750; one 14x96 plain grinder, $2,000; one 18-inch key seating machine, $575; one tool grinder for cutter work, $400; one Heald cylinder grinder, $750; one 48-inch lathe, $2,800. The machines are said to be in perfect condition.

New Mexico Irrigation Law Ruled Void

Attorney-General Holds Act Conflicts With Provisions of State Constitution

James N. Bujac, Assistant Attorney-General of New Mexico, has ruled unconstitutional Chapter 107, Laws of 1923, of that state, which is "An act relating to lands within and forming part of certain irrigation districts which have heretofore or may be hereafter sold for delinquent taxes." The grounds on which the law is declared in conflict with the state constitution, as set forth in his statement, are that it attempts to extend the time of payment of taxes, and to take the property taxes out of the hands of the state treasurer for three years, thus seeking to regulate the acts of that official.

In his opinion Mr. Bujac sites Sec. 24, Art. IV, of the state constitution which provides: "The legislature shall not pass local or special laws in any of the following cases: Regulating . . . . the assessment or collection of taxes or extending the time of collection thereof . . ." and adds:

"Has this section of the constitution been violated in the present case? The county treasurer generally when land is sold to the county for taxes, holds such land until such time as he can sell it to some third person for the amount due for taxes, interest, penalties and costs or until the original owner of the land redeems the property by paying the taxes, interest, penalties and costs due. Sec. 2 of said Chapter 107 makes it obligatory on the part of the county treasurer to, "at any time after the expiration of the period or redemption provided by law" and provided the property has not been redeemed or sold by the county, "deliver a tax deed conveying said land to the board of directors of the irrigation district in which the land is located, subject to a prior lien for taxes, interest, penalties and costs. Sec. 3 then makes it obligatory on the part of said board of directors to sell said land for not less than the amount of the lien and to pay the county treasurer the amount of said lien with a provision in Sec. 5 that if the amount of the lien be not fully paid within a period of three years from the date of such deed, the county shall at the expiration of said three-year period become reinvested with the title conveyed so that Chap. 107 not only extends the time for the collection of taxes but absolutely takes the land out of control of the county treasurer for this three year period and thus attempts to regulate the acts of the county treasurer by special legislation which in view of the decision of our supreme court, heretofore quoted, the legislature is prohibited from doing by Sec. 24, Art. 4 of our state constitution.

"Then again this chapter does not provide that the board of directors shall pay to the county until they have sold the land in question and this in reality means that there is an actual transfer of an obligation due to the county without any consideration, or, at best, it postpones the liability which is in violation to Sec. 32, Art. 4 of the constitution of this state which reads:

" 'No obligation or liability of any person, association or corporation, held or owned by or owing to the state, or any municipal corporation therein, shall ever be exchanged, transferred, remitted, released, postponed, or in any way diminished by the legislature, nor shall any such obligation or liability be extinguished except by the payment thereof into the proper treasury or by proper proceeding in court.' "

Warns of Forest Problem

George H. Barnes, president of the American Reforestation Association, speaking recently before a Southern California service club, brought before his audience some compelling facts relative to the dependence of water supply on forest cover. Depletion of timber has reduced the underground water supply of the nation to 47 per cent and that of Southern California to 17 per cent, he declared. He pointed out that forested mountain areas preserve 92 per cent of the rainfall, while only 20 per cent of the precipitation is saved in denuded sections.

Mr. Barnes pictured the situation as a national peril threatening every state in the nation. "Every state has water trouble," Barnes said. "It is the direct result of forest destruction. Depletion of forests without reforestation is the most awful indictment of a people in the history of the world."

New Arizona Company

To simplify methods of operation and clarify the irrigation situation on the Pima Farms Company's project, southern Arizona, a new company, the Catalina Water Company, will be formed to conduct the irrigation of a large tract under separate control. Articles of incorporation have been filed with the Arizona Corporation Commission. The capital stock of the company is $1,000,000, and George R. Darnell and A. R. Conner are the incorporators.

Wind Conditions Complicate Irrigation Problems

Fall Winds Make Special Care Necessary in Giving Trees Proper Moisture Supply.

Wind conditions in parts of the Southwest make the problem of orchard irrigation an especially complicated one during the fall season, says Harold Wahlberg, a Southern California horticultural expert, in a recent statement. Special care must be observed to see that the tree is adequately supplied with water to meet the large demands of the windy days when humidity is below normal, and yet the root system must not be weakened with excess moisture, he points out. Mr. Wahlberg says:

"With the approach of the fall season orchardists are confronted with the possibilities of the annual desert winds. Past experience and observations have conclusively shown that there is a direct relation between wind injury resulting from exposure to desert winds and the condition of the soil moisture in the orchard at the time and during the period previous to the windy season. It is well, particularly at this time, to see that the trees are supplied with an ample amount of soil moisture in order that the supply may be sufficient to take care of the extra demands made upon the tree during the periods of low humidity.

"Wind injury is not only influenced by the proper moisture conditions at this season of the year and during the immediate period of wind exposure, but it has been found that the general moisture condition throughout the year must be kept at an optimum growing point, if we would get the best results. In other words, the tree's ability to resist unfavorable wind action is largely dependent on the condition of the root system at the time of the hot blasts. If the roots have enjoyed optimum growing moisture throughout the growing season, the tree will be able to take up ample supplies of moisture during the emergency period because of the maximum absorption facilities of its normal root system.

"On the other hand, if the roots have been subjected to excessive wet conditions, they have been automatically weakened and will not be able to function to a normal degree when an extreme weather emergency arises, but in the case of normal roots, the danger of irrigation at this time of the year is improbable.

"As we enter on the fall period, we should continue the use of the soil augur to determine how deep we ought to apply moisture at this time of the year."

IRRIGATION MANAGEMENT

THE IRRIGATION MANAGER A BUILDER FOR THE AGES

By H. M. CHADWICK

Assistant State Engineer of Oregon

This article is taken from an address delivered by Mr. Chadwick before the Oregon Irrigation Congress, in session at Grant's Pass, Oregon, early in October. Mr. Chadwick's topic was "Water Use," and was, of course, covered much more comprehensively than has been possible in the limited space here available.

WE who live in this glorious western country, rarely, if ever, realize the many obstacles which were thrown in the way of its development. After the war with Old Mexico and when the treaty of Guadalupe Hidalgo was signed, we acquired by right of conquest a vast area of land, including some of the richest territory now in the West.

We are now inclined to look upon our fertile fields and vast irrigated valleys and thriving, busy cities with an air of complacency, taking these things as a matter of course; but let us for the moment digress and turn our heads toward the past and view for a moment the attitude once taken by a vast number of eastern people toward this matter of development of the West.

MOST notable among the outbursts of censure against the acquirement of more land was a memorable speech by no less a personage than the brilliant senator, Daniel Webster—Webster, a man of wonderful intellect, an orator able by the eloquence of language to sway public sentiment and to attain in a large degree the objects he fought for. Mr. Webster took his stand against the acquisition of more territory, and in part said:

"What do you want of that vast and worthless area, that region of savages and wild beasts, of deserts, of shifting sands and whirling winds, of dust, of cactus and prairie dogs? To what use could we ever hope to put those great deserts, and those endless mountain ranges, impenetrable and covered to their very base with eternal snow? What can we ever do with the western coast, a coast of three thousand miles, rockbound, cheerless and uninviting?"

IT IS occasionally a salutary thing for the executive to look at his job in the abstract—in its relation to the past and the future rather than the petty worries of the day. That is what Mr. Chadwick has done in this extract. He has given us a glimpse backward and a vision forward. He concluded his speech before the Oregon Irrigation Congress by quoting the following from an anonymous source:

"'Although the tomb of Moses is unknown, the traveler of today slakes his thirst at the well of Jacob. The gorgeous palaces of the wisest and wealthiest of monarchs, with their cedar and gold and ivory, and even the great temple of Jerusalem, hallowed by the visible glory of the Deity Himself, are gone; but Solomon's reservoirs are as perfect as ever. Of the magnificent and costly architecture of the Holy City, not one stone is left upon another, but the pool of Bethesda commands the pilgrim's reverence at the present day. The columns of Persepolis are moldering into dust, but its cistern and aqueduct remain to challenge our admiration. The golden house of Nero is a mass of ruins, but the Aqua Claudia still pours into the city of Rome its limpid stream. The Temple of the Sun, at Tadmor in the wilderness, has fallen, but its fountain sparkles in the rays of the morning as when thousands of worshipers thronged its lofty colonnades. And if any work of this generation shall rise over the deep ocean of time, we may well believe that it will be neither a palace nor a temple, but some vast aqueduct or reservoir.'"

It is fortunate that Mr. Webster did not prevail, for some other nation might now be developing the West of today. Look at what has been done with that 3,000 miles of rockbound, cheerless coast, that Mr. Webster scorned. Picture the thriving, hustling cities—the wonderful garden spot of the Imperial Valley, once a vast and worthless area, and realize that the use of water was the prime factor in the development of this great area.

The use of water has brought the "howling wilderness" to a state of beauty and productivity. The use of water is indeed the burning question. It is the life blood of the West. Without it we parch and burn; with it we revel in a glorious profusion of growth. We know the value of water. We see it demonstrated in various ways, and in many different parts of the country. It remains only for us to learn a more efficient use of this water. It remains for us more fully to realize the actual wealth that lies within it.

MODERN irrigation practice is still undergoing changes. Many studies have been made by competent investigators on the duty of water and the manner of the preparation of the land to receive the water.

The United States Department of Agriculture through its department of irrigation investigations and under the guiding hand of that grand old man of irrigation, Dr. Fortier, has done wonderful work in determining, through actual experiment, the duty of water for various crops in many different types of soil, and in many different localities.

Our own Oregon Agricultural College, through Professor W. L. Powers, Chief in Soils, has conducted duty of water experiments of inestimable value throughout the State. Oregon Agricultural College Bulletin Number 140 entitled, "The Economical Use of Irrigation Water," by Professor Powers contains a veritable fund of detail showing the results of his experi-

neer's office has supervision over the distribution of water from the adjudicated streams of the state. It is presumed that this power was granted in order that the water might be all placed to beneficial use. In any event, beneficial use is the basis, the measure, and the limit of the right to the use of water. This doctrine is quite generally recognized throughout the arid West.

The waste of water under any circumstances is deplorable. It may not be clear to some water users what, if any, benefits they would receive by saving for others a part of the water supply they are authorized to use. In meeting this objection one has to remind the water user that maximum yields can be obtained with ordinary quantities of water properly applied, and that when an excess quantity is applied it tends to leach out plant food, water-log the soil or bring up alkali.

THE expression is sometimes used, "Where water is cheap and land is valuable, etc." Those days are gone forever. Water may be cheaply applied, that is to say, a system confronted with little or no difficulties may be constructed cheaply and the cost to the farmer may be very reasonable, but by reason of the great areas of arid, arable lands and the deficiency of natural water, because of this aridity, water, or the right to use it, is never cheap.

The use of water is indeed a science and as time goes on and available sources are appropriated and used the State's job of administering the waters will become increasingly complex and difficult and will require the assistance of all intelligent water users who realize that the only path to successful irrigated farming is through the economical use of water.

The old time wasteful use must, by force of necessity, disappear, and be replaced by a scientific application. Those who can not or will not conform to the new order of things must surely fall by the wayside and give room for those that can. Such is nature's inexorable law of the survival of the fittest.

The irrigation farmer, if he is to succeed, must indeed be something of an engineer, for the most beneficial and economic application of water over and upon a farm is in a sense a problem in hydraulic engineering superimposed upon the age-old art of making crops grow out of the ground.

This is indeed a noble and glorious work we are engaged in. So busy are we and so completely engrossed in our work that we rarely take the time to consider it in true perspective and to realize fully the really marvelous results obtained.

Study Effect of Check Dams in Water Conservation

Thirty Ventura County, California, Ranchers are Shown Beneficial Results near La Crescenta

Thirty farmers of Ventura County, California, interested in the problem of water conservation, recently visited La Crescenta, Los Angeles County, home of Harvey S. Bissell, prominent California conservationist, at his invitation, to study the effects of check dams in conserving water run-off in canyons in that locality.

The trip was arranged under the auspices of the Ventura County Chamber of Commerce, farm bureau and agricultural extension service, and the party included a number of men who had previously been very skeptical of the value of check dams. According to one of the party, "every one who saw the system demonstrated was thoroughly sold on the efficiency of this device."

One canyon visited was systematically laid out with check dams after being practically denuded by fire in 1913. The investigators were shown that vegetation below the dams was green and luxuriant, although the hillsides were almost entirely bare, and were told that there had been very little run-off, most of the water penetrating the soil and being available for future use.

Mr. Bissell, who is an advocate of the check dam, testified that the water table in canyons so protected had been raised, while the level in canyons without the dams had fallen materially. One canyon, it was declared, previously called a "dry" canyon, had its water flow increased more than 200 per cent.

The Ventura county ranchers are interested in the possibility of using check dams to conserve water in Ventura and Santa Barbara counties.

Are Your Orchard Trees Getting Optimum Moisture Supply?

(*Continued from Page 17*)

Optimum moisture content in the soil is estimated to be about one-half of what it will absorb and retain as capillary moisture. Especially during spring and early summer should the moisture content not be kept above optimum. During this period the tree is very active and requires for best results that the soil be well aerated and warm, making for greater activity in the root system and a more ideal environment for growth and development of the beneficial bacterial flora.

Keeping the soil then supplied with moisture up to its field capacity is bad practice and has been found to cause dying of roots and an unhealthy and unprofitable orchard. The grower should be cautioned not to go to the other extreme and let his soil get too dry, but to maintain his moisture content as near the optimum as possible.

THE IRRIGATOR may ask: "How can I determine my soil moisture content?" The answer is: Use a soil augur or a shovel and determine it as deeply as the roots go. It may be impossible to get away from the old time schedule. In many parts of Southern California, for instance, the schedule has to be adhered to. Frequently, however, changes can be made or possibly one irrigation skipped entirely if the orchard is found with a high moisture content just preceding irrigation time.

Water passes down through light soils quickly with relatively little lateral movement. It percolates through heavy soils slowly with an increased lateral seepage. Light soils such as sandy and gravelly ones have comparatively large soil particles and consequently less pore space than heavy soils which have small soil particles. The lighter soils have a lesser number of soil particles and consequently are retentive of a lesser amount of water. They dry out sooner and need to be supplied with water more often than heavy ones.

Irrigation in furrows is the method most used in citrus orchards. When it is used in orchards of sandy or light soils, furrows approximately 250 to 300 feet should be the limit; otherwise to wet properly the portion of the orchard farthest away from the source of water, too deep penetration is realized in the part nearest the source. In heavy soils longer furrows can be used because of the slower penetration, although probably 500 feet should be about the limit. Soils with a plow sole do not irrigate well under the furrow system because there is not sufficient loose soil to absorb and hold enough water for penetration. Plow sole should be broken up.

There is some lateral movement in all soils under furrow irrigation and the finer the soil the greater the lateral movement. This carries a considerable quantity of soluble salts laterally where

the surface much remains indefinitely. ome of it is soluble plant food and is ot obtained by the tree until perhaps the inter rains carry it downward when ie need for it is not so great.

Basin irrigation is practiced by citrus rowers to some extent, and is perhaps fer to use in light than in heavy soils. Distribution is probably better accomlished by this method as more of the rface is wetted. There is a danger inolved, however, in possibly inducing n environment in which brown rot inection will take place, causing gumosis on the trunk of the tree. Further, robably the physical condition of the oil is not so good in orchards where this ethod is practiced.

OVERHEAD or spray irrigation is being tried in many sections and ppears to be proving satisfactory, especially on light soils. It would appear o be the ideal way to irrigate because a more uniform distribution should be obtained. By obtaining a more uniform distribution, a more economical use of water, and of the fertilizer applied, is also obtained. No accumulation of salts in the surface would be experienced and penetration of moisture can, moreover, be regulated. The acreage this season, 1925, under overhead irrigation has increased possibly 1,000 per cent over 1924. If this method proves satisfactory in orchards with heavy soils it will be a boon to growers irrigating hillside orchards.

Summary

1—Every effort should be made to conserve applied irrigation water and rainfall.

2—Proper distribution throughout orchard and root area should be accomplished.

3—The soil should not be kept too moist, especially during the spring and early summer period because it retards growth.

4—Penetration of moisture should be effected as deeply as the roots feed.

5—The soil should not be allowed to get dry so that there is danger of wilting.

Application: In order to make a success of fruit growing the grower must have a sufficient quantity of good quality fruit. This will not be realized unless he has thrifty and vigorous trees. To have thrift and vigor a good healthy top with a well developed leaf surface and a root system that approaches the ideal must be maintained. This can only be had in a proper environment where soil texture is good and the soil properly managed making for optimum conditions as regards moisture, aeration and nutrients.

neer's office has supervision over the distribution of water from the adjudicated streams of the state. It is presumed that this power was granted in order that the water might be all placed to beneficial use. In any event, beneficial use is the basis, the measure, and the limit of the right to the use of water. This doctrine is quite generally recognized throughout the arid West.

The waste of water under any circumstances is deplorable. It may not be clear to some water users what, if any, benefits they would receive by saving for others a part of the water supply they are authorized to use. In meeting this objection one has to remind the water user that maximum yields can be obtained with ordinary quantities of water properly applied, and that when an excess quantity is applied it tends to leach out plant food, water-log the soil or bring up alkali.

THE expression is sometimes used, "Where water is cheap and land is valuable, etc." Those days are gone forever. Water may be cheaply applied, that is to say, a system confronted with little or no difficulties may be constructed cheaply and the cost to the farmer may be very reasonable, but by reason of the great areas of arid, arable lands and the deficiency of natural water, because of this aridity, water, or the right to use it, is never cheap.

The use of water is indeed a science and as time goes on and available sources are appropriated and used the State's job of administering the waters will become increasingly complex and difficult and will require the assistance of all intelligent water users who realize that the only path to successful irrigated farming is through the economical use of water.

The old time wasteful use must, by force of necessity, disappear, and be replaced by a scientific application. Those who can not or will not conform to the new order of things must surely fall by the wayside and give room for those that can. Such is nature's inexorable law of the survival of the fittest.

The irrigation farmer, if he is to succeed, must indeed be something of an engineer, for the most beneficial and economic application of water over and upon a farm is in a sense a problem in hydraulic engineering superimposed upon the age-old art of making crops grow out of the ground.

This is indeed a noble and glorious work we are engaged in. So busy are we and so completely engrossed in our work that we rarely take the time to consider it in true perspective and to realize fully the really marvelous results obtained.

Study Effect of Check Dams in Water Conservation

Thirty Ventura County, California, Ranchers are Shown Beneficial Results near La Crescenta

Thirty farmers of Ventura County, California, interested in the problem of water conservation, recently visited La Crescenta, Los Angeles County, home of Harvey S. Bissell, prominent California conservationist, at his invitation, to study the effects of check dams in conserving water run-off in canyons in that locality.

The trip was arranged under the auspices of the Ventura County Chamber of Commerce, farm bureau and agricultural extension service, and the party included a number of men who had previously been very skeptical of the value of check dams. According to one of the party, "every one who saw the system demonstrated was thoroughly sold on the efficiency of this device."

One canyon visited was systematically laid out with check dams after being practically denuded by fire in 1913. The investigators were shown that vegetation below the dams was green and luxuriant, although the hillsides were almost entirely bare, and were told that there had been very little run-off, most of the water penetrating the soil and being available for future use.

Mr. Bissell, who is an advocate of the check dam, testified that the water table in canyons so protected had been raised, while the level in canyons without the dams had fallen materially. One canyon, it was declared, previously called a "dry" canyon, had its water flow increased more than 200 per cent.

The Ventura county ranchers are interested in the possibility of using check dams to conserve water in Ventura and Santa Barbara counties.

Are Your Orchard Trees Getting Optimum Moisture Supply?

(*Continued from Page 17*)

Optimum moisture content in the soil is estimated to be about one-half of what it will absorb and retain as capillary moisture. Especially during spring and early summer should the moisture content not be kept above optimum. During this period the tree is very active and requires for best results that the soil be well aerated and warm, making for greater activity in the root system and a more ideal environment for growth and development of the beneficial bacterial flora.

Keeping the soil then supplied with moisture up to its field capacity is bad practice and has been found to cause dying of roots and an unhealthy and unprofitable orchard. The grower should be cautioned not to go to the other extreme and let his soil get too dry, but to maintain his moisture content as near the optimum as possible.

THE IRRIGATOR may ask: "How can I determine my soil moisture content?" The answer is: Use a soil augur or a shovel and determine it as deeply as the roots go. HYDRAULIC ENGINEERING

Dealing with the Practical Problems of the Operating and the Consulting Engineer

NEW VENTURI FLUME DECLARED DISTINCT ADVANCE

By RALPH L. PARSHALL

Senior Irrigation Engineer, Bureau of Public Roads, U. S. Department of Agriculture.

This article is reprinted, with permission, from the Proceedings of the American Society of Civil Engineers. Mr. Parshall's paper was recommended for publication by the Society's special committee on Irrigation Hydraulics. A few paragraphs of the paper are necessarily omitted.

MEASUREMENT of flowing water in irrigation practice often requires that little loss of head be sacrificed by the measuring device. Because of the relatively large loss of head, the standard overfall weir is, in many cases, objectionable. Although when operating under standard conditions, it is one of the most accurate of measuring devices for practical field installation, it is not always possible to maintain these standard conditions, such as proper bottom contraction, velocity of approach, and aeration of nappe. The submerged orifice has not met with entire success because of the uncertainty of the coefficient of discharge, velocity of approach, and constancy of condition. The ordinary rating flume often becomes inaccurate within a short time.

To meet the objections found in other measuring devices now in common use, the present Improved Venturi Flume has been developed. The improvements over the old Venturi flume consist in the reduction of the convergence in the inlet section, lengthening of the throat section, change of divergence of the outlet section, and depressing the floor in the throat section. These changes have improved the flow conditions, reduced the effect of submergence, and simplified the operation by reducing the number of gauges necessary to determine the discharge.

Type of Structure—This flume (Fig. 1) has three major parts, a converging inlet, a parallel-sided throat, and a diverging outlet. All the side walls are vertical. The inlet has a level floor between the sides, each side converging at a rate of 1 ft. in 5 ft. of length. The floor of the throat slopes downward with a vertical fall of 9 in. in a horizontal distance of 2 ft. The outlet floor slopes upward at the rate of 6 in. in 3 ft., and each wall diverges at the rate of 1 ft. in 6 ft. of length. The crest is the down-stream end of the level floor, and the crest length or size of flume is the distance, in feet, between the vertical walls of the throat. The lengths of the throat and the outlet of the flume are 2 and 3 feet., respectively, for all sized flumes from 1 ft. to 8 ft. The side of the inlet is made longer as the width of the flume increases, according to the arbitrary rule, $\frac{W}{2} \div 4$, in which W is the width of the flume, or crest length, in feet.

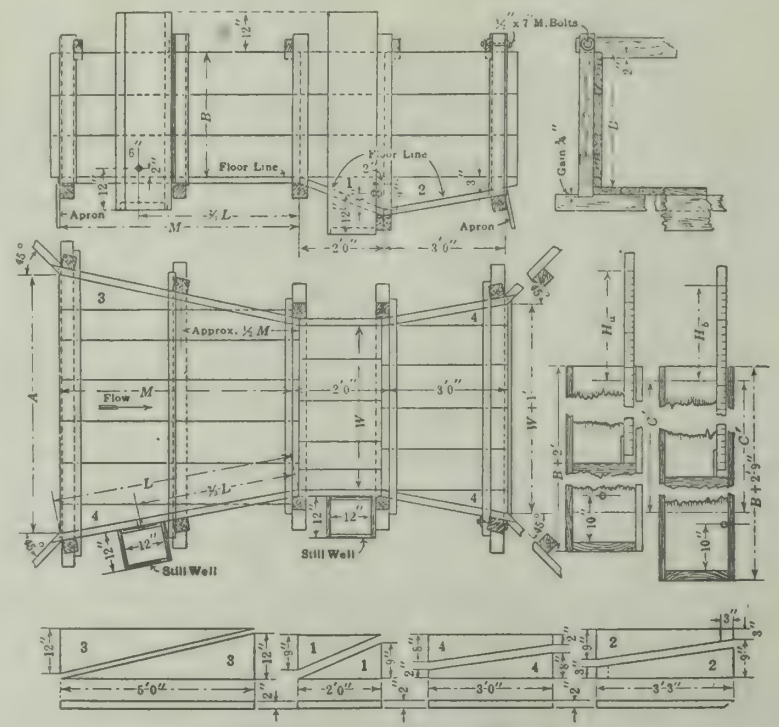

FIG. 1.—IMPROVED VENTURI FLUME.

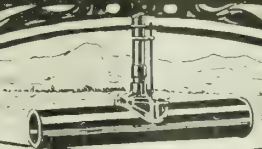
THERE are two general conditions of flow, namely, "free flow" when the elevation of the water surface at the throat gauge, or *Hb*, is lower than the crest, and "submerged flow", when the elevation of the water at the throat gauge is higher than the crest. The upper head, *Ha*, is observed at a point two-thirds the distance from the crest to the upped end of the inlet, along the side-wall, whereas, the throat head, is observed at a point 3 in. vertically and 2 in. horizontally up stream from the lowest point of the depressed throat floor. Both the upper head, *H-a*, and the throat head, *H-b*, are referred to the crest level as the datum. Under certain conditions of flow the throat reading may be negative.

Laboratory Tests.—Calibrations were made on flumes having crest lengths of 1, 2, 3, 4, 6 and 8 ft. with a minimum flow of 0.3 sec.-ft. through the 1-ft. flume, and a maximum of 62.5 sec.-ft. through the 6-ft. flume, the supply not



ACCURATE WATER MEASUREMENT PAYS

Announcing the New "Open Flow Type"
SPARLING IRRIGATION METER

This is, in effect, a sensitive and accurate current meter with integrating dial.

It is easily adaptable to any submerged orifice and can be slipped into its bracket supports or removed instantly.

Meters the **main flow** without diversion and is sufficiently protected from floating trash to insure reliable operation.

Registers directly either in acre-feet or in lineal feet of flow.

Is low in price and a thoroughly practical field meter.

*The table is presented to show the number of tests, within the limits indicated, in which the computed values are, respectively, greater or less than the observed values. Figures set in ordinary, or light faced type, are to be read as positive figures, and indicate the number of times the computed values are greater than observed values. Figures set in black-faced type are to be read negative, and indicate the number of times the computed figures values are less than the observed values.

mum through the 8-ft. flume. The discharge in second-feet through this device, under free-flow conditions and under submerged conditions when the down-stream head does not exceed 70 per cent of the upper head, is very closely approximated by the empirical formula:

$$Q = 4\ W\ Ha^{1.522\ W^{0.026}}$$

in which,

Q = discharge, in second-feet.

W = width of flume or crest length, in feet; and

Ha = upper head, in feet.

THE accuracy of this device under these conditions is believed to be sufficient for practical field purposes. Table 1 shows the distribution of errors resulting from the comparison of the observed discharges with the results computed from the empirical formula. In determining the errors and their signs, the observed values are taken as the basis of comparison. Table 1 is based on the complete free-flow series of tests made on the six sizes of flumes studied, except one test which is believed to be in error * and the submerged flow tests for submergence up to 71 per cent of the upper head. Submergence, as herein mentioned, means that the water surface, as indicated by the throat gauge, or Hb, is positive or above the crest level. For conditions of flow, as shown in Figs. 3 and 4, the degree of submergence, as indicated by the ratio, $Hb:Ha$, is somewhat less than the actual submergence would be if the water surface in the outlet were considered.

*Test No. 6512 on the 3-ft. flume, in which $Ha = 0.705$ ft.; $Hb = 0.264$ ft.; percentage of submergence = 0; observed quantity = 8.33 sec. ft.; computed quantity = 6.94 sec.-ft.; percentage of error = 16.7.

Table 2 shows the percentage of deviation of the calculated free-flow from the observed discharge, where the degree of submergence varies from 69 to 79 per cent. It will be noted in this table that the agreement of calculated and observed values increases with the head, as well as with the width of flume. The increased velocity of the water in the throat section, together with the action of the depressed floor, causes a hydraulic jump to be formed immediately below in the diverging outlet of the flume. This combination of increased velocity and depressed floor has the effect of resisting the submergence up to a point of about seven-tenths of the upper head, Ha. It will be observed in Table 2 that for the 1-ft. flume and small flow the velocity is not sufficient to overcome the resistance of the water held in the depressed sec-

tion, or, in other words, the point of measuring the throat head, *Hb,* is too far down stream to be within the range of the draw-down of the water surface for these small heads.

For the most satisfactory operation of this device, it is recommended that the flume operate under conditions in which the submergence does not exceed 70 per cent. Under such conditions only one observation of depth is necessary to determine the rate of flow. For submergence greater than 70 to 75 per cent, the discharge is then a function of both the upper head, *Ha,* and the throat head, *Hb.* Laboratory tests show that when the submergence is greater than about 98 per cent, no great dependence can be placed on the measurement.

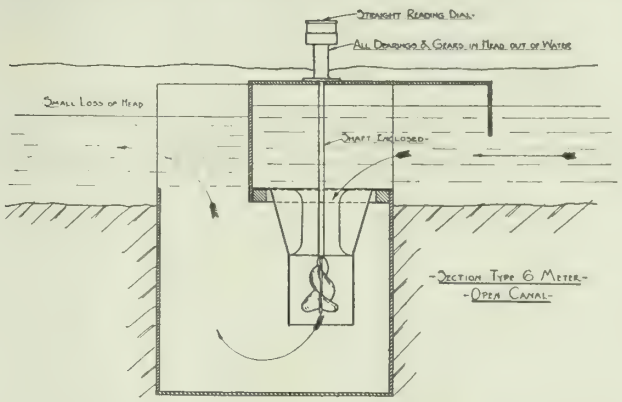
Field Tests—Since completing the calibrations of the various sized flumes, outside field installations have been made to test the device under practical conditions. At Wellington, Colo., a small lateral was selected having a flat grade, where the stream of water carried some sand and silt. In this case there is an experimental 3-ft. Improved Venturi Flume in the lateral, where the upper head, *Ha,* is 0.86 ft., and the throat head, *Hb,* 0.63 foot, with a difference of 0.23 foot, the ratio, *Hb*:*Ha,* being 73 per cent. The discharge under this condition is in accordance with the free-flow law and the rate of flow can be assumed to be a function only of the upper head, *Ha,* thus giving a discharge of 9.48 sec.-ft. A standard weir will not operate successfully in this lateral, first, because of the deposit which would occur in the weir box; and, second, because of the small head available. This discharge of 9.48 sec.-ft. over a 3-ft. rectangular weir would require a head of exactly 1 foot, and to this possibly an extra 0.10 foot should be added to assure a complete aeration, making a total loss of head of about 1.1 ft. By careful measurements with an engineer's level, the loss of head through the Improved Venturi Flume, under the conditions as stated, was only 0.19 ft.†

Under conditions where sand and silt occur, it has been observed that if a difference in head of 0.05 to 0.10 ft. can be maintained for a moderate upper head, no deposit will accumulate in the flume even where excessive quantities of sediment are carried in the stream.

Velocity of approach seems to have little or no effect on the rate of discharge for free-flow conditions.

†Note approximately similar conditions of heads for the 3-ft. flume, Table 2.

THE RELIANCE METER



Straight Reading Dial
All Bearings & Gears in Head out of Water
Small Loss of Head
Shaft Enclosed
Section Type 6 Meter
Open Canal

THE RELIANCE IRRIGATION METER has been the standard low pressure Meter for 10 years—thousands installed throughout the irrigated sections of the West. Built in various types and sizes to fit all deliveries on canal and pipe systems. Easy to install—easy to read. Straight reading cubic foot or acre foot dials. Simple in construction, few and slow moving parts—upkeep negligible. No bearings or gears under water—small loss of head. Unaffected by dirt and floating debris in water. There is a size and type to settle your measurement problem.

WITH THE WATER COMPANIES

Of Interest Expressly to Water Works Engineers, Superintendents and General Managers

WATER WORKS MEN ARE MEETING IN CONVENTION

THREE hundred California water works men — responsible executives of city water departments and private water companies throughout the state — will gather October 15 for a three day session at Santa Cruz, California, in the sixth annual convention of the California Section of the American Water Works Association.

The Casa Del Rey, picturesque Santa Cruz hotel, will be the convention headquarters.

The eyes of the water works profession will be centered on California during the time that the convention is in progress, for the California Section of the national association has proved itself, during the six years since its organization, to be one of the livest and most progressive regional divisions in the entire country. During the past year the California Section was awarded the Nicholas C. Hill cup for the greatest growth of any of the Sections of the American Water Works Association.

The national body is comprised by the leading water works officials, executives and engineers throughout the United States, and the California Section's membership includes representatives of nearly every water works department and corporation in the state.

GEORGE W. PRACY, superintendent of the Spring Valley Water Company, San Francisco, and president of the California Section, will preside over the sessions of the convention. Fred M. Randlett, National Director of the American Water Works Association, and formerly chief engineer of the Department of Water of the city of Portland, Oregon, will represent the national association.

No effort has been spared by the executives of the Section to plan a convention that will be crowded with benefits to the attending delegates. Beginning with registration in the Sun Room of the Casino at the convention hotel, at 10:00 a. m., Thursday, October 15, a program full of interesting and practical papers, discussions and reports has been prepared, and the business sessions will be agreeably relieved by lighter things prepared for the enjoyment of those attending.

An informal dinner, with speeches that are guaranteed to be different from the usual run of post-prandial oratory, will close the first day's session. Chester Rowell, well-known California writer and lecturer, will be the principal speaker.

CALIFORNIA Section of the American Water Works Association is in convention at Santa Cruz as this magazine comes from the press, enjoying the benefits of a carefully prepared program, replete with helpful discussions and delightful entertainment. The complete program of the convention, at which three hundred delegates are expected, is given in this article. Next month MODERN IRRIGATION *will have a complete story of the convention. The California organization is one of the most progressive of the regional divisions of the national association, and is accomplishing much for its membership and the profession in general by its work on the Pacific Coast.*

A dinner-dance will be extended to the convention as a courtesy from the exhibitors of equipment, on Friday evening, and on Saturday, dull care will be pushed aside entirely and the convention will be conveyed en masse by the city and Chamber of Commerce of Santa Cruz on an automobile tour around historic and beautiful Monterey Bay and to the Big Trees and other points of interest.

THE COMMITTEES in charge of the convention include the reception committee, comprised by R. W. Keene, Hersey Manufacturing Company, Los Angeles; R. M. Northup, Neptune Meter Company, Los Angeles; and Judy I. Prugh, superintendent of Water, Sacramento, and the local committee on arrangements, comprised by George C. Pratchner, commissioner of public works, and R. S. Tait, water department superintendent, both of Santa Cruz.

Associate members of the association, who are for the most part manufacturers or dealers in equipment and supplies used by water works in construction and maintenance, will have an interesting and instructive display of their goods as one of the features of the convention. The committee on exhibits includes: R. W. Martindale, Pacific Coast Manager, U. S. Cast Iron Pipe & Foundry Company; C. B. Abbott, president, Water Works Supply Company, and J. R. Baker, Pacific Coast Manager, Neptune Meter Co., all of San Francisco; Frank M. Brooks, Manager Art Concrete Works, Pasadena, and J. J. Swenson, Pacific Coast Manager, American Cast Iron Pipe Company, Los Angeles.

New officers of the California Section are to be elected by the convention at the close of the business of the first day. The 1925 officers are: George W. Pracy, Superintendent Spring Valley Water Company, San Francisco, Chairman; C. B. Jackson, Superintendent Fresno City Water Corporation, Fresno, Vice-Chairman; P. Diederich, Superintendent, Department of Public Service, Glendale, Member Executive Committee; John Burt, General Manager, Marin Municipal Water District, San Rafael, Calif., Member Executive Committee; S. B. Morris, Superintendent and Chief Engineer, Pasadena Water Department, Pasadena, Calif., Secretary and Treasurer.

The convention program is announced as follows:

THURSDAY, OCTOBER 15TH

10: A. M.—Sun Room, The Casino, Hotel Casa Del Rey—General get together, registration and review of exhibits.

2:00 P. M.—Sun Room, The Casino, Hotel Casa Del Rey.

Address of Welcome

Hon. J. B. Maher, Mayor of Santa Cruz

Reading of Papers

1. "Recent Improvements in the Santa Cruz Water System," George C. Pratchner, Commissioner of Public Works, and E. C. Tait, Superintendent, Santa Cruz Water Department.

2. Symposium: "Service Installation Methods and Standards." Discussion to be opened by George Read, Superintendent, Meter and Service Department, Bureau of Water Works and Supply, Los Angeles.

3. Symposium: "Meter Maintenance Methods." Discussion to be opened by J. H. Fagg, Pacific Gas & Electric Corp., Stockton.

6:30 P. M.—Informal Dinner, Hotel Casa Del Rey.

Business Meeting—Reports of Retiring Officers. Reports of Committees. Election of New Officers, Selection of next place of meeting. Speakers, Hon. Judge Harry C. Lucas, Santa Cruz, and Hon. Chester H. Rowell, prominent lecturer and former member of California State Railroad Commission.

FRIDAY, OCTOBER 16TH

10:00 A. M.—Sun Room, The Casino, Hotel Casa Del Rey.

Reading of Papers

1. "Design and Construction of Concrete Lined Distribution Reservoirs," I. E. Flaa, Chief Draftsman, Spring Valley Water Company, San Francisco.

2. "Design of Balancing Reservoirs and Stand Pipes for Flat Cities and Communities." E. K. Barnum, Engineer, Fresno City Water Corporation.

3. Symposium: "Jointing Methods for Water Mains." To be led by Clark H. Shaw, Chief Engineer and Superintendent, Long Beach Water Department.

2:00 P. M.—Sun Room, The Casino, Hotel Casa Del Rey.

Reading of Papers

1. "Relation of Railroad Commission to the Water Works Man," W. R. MacKall, Hydraulic Engineer, California State Railroad Commission.

2. "Cooperation between the Water Works and Fire Departments in Decreasing Fire Losses," Thomas Baird, Chief Engineer Fire Department, Fresno.

3. "Use of Mechanical Equipment in Trenching, Backfilling, and Pipe Laying," Thomas Brooks, Assistant Superintendent, Bureau of Water Works and Supply, Los Angeles.

The following five minute papers and general discussion of water works problems to be presented as time permits after main papers at regular sessions:

1. "Methods used in moving 36-inch Riveted Steel Water Main," Judy I. Prugh, Superintendent, Distribution, Sacramento Water Department.

2. "Relation of Water Pressures, Service Sizes and Interior Fixtures to Complaints of Inadequate Water Service," V. E. Perry, Assistant Manager of Water Sales, Spring Valley Water Company, San Francisco.

3. "Methods of Protecting Services and Meters during Street Grading and Paving Operations." P. Diederich, Superintendent Public Service, Glendale.

6:30 P. M.—Hotel Casa Del Rey—Dinner-dance as guests of the exhibitors.

SATURDAY, OCTOBER 17TH

10:00 A. M.—Leaving Hotel Casa Del Rey promptly at 10:00 a. m. Automobile trip with basket lunch to Big Trees and other points of interest around the famous Monterey Bay, as guests of the City and Chamber of Commerce of Santa Cruz. Returning to Hotel by 4:00 P. M.

Washington Opinion Divided on Basin Project

(*Continued from Page 22*)

. . . The Columbia Basin scheme is utterly impracticable. Two-thirds of its alleged reclaimable lands this newspaper, which is familiar with them, would not take as a free gift. . . And yet this white elephant thing is dragged in everywhere. . . The fatuousness of some of these boosters and the childlike faith in their absurd chatter . . . etc."

A more moderate tone is exemplified by the Chehalis *Advocate*: "This paper has found itself in somewhat of a minority on this side of the state because it was reluctant to endorse the Columbia Basin project as outlined at present.

"The Columbia Basin project will come in time but a somewhat intimate knowledge of conditions in irrigated districts, leads us to the very positive hope that it will not be started until demand comes from those who want to farm the land and know the cost of so-doing, rather than from those who will simply farm the farmers.

"Let the work in behalf of the project continue, but let it be constructive, designed to aid the man on the farm solely, and the rest of us will receive the aid we deserve."

LOS ANGELES.—City Council of Los Angeles has passed a resolution urging President Coolidge to make definite recommendation to Congress in his next message, urging federal development of the Colorado River.

WHO'S *WHO* AND WHO'S *WHERE*

IN IRRIGATION AND RECLAMATION

Personal Notes and Impersonal Observations About Men You Know

William Spry, commissioner of the United States Land office, and former governor of Utah, spent part of September in Los Angeles. He has just completed a tour of land offices which were consolidated by the recent reorganization of his bureau.

O. S. Fisher, federal extension agronomist, is spending two weeks in Arizona, during which he plans to visit typical irrigated farms in all sections of the state. He is making the tour in company with Byron J. Showers, agronomy specialist of the University of Arizona.

New directors were elected in September by the Palo Verde Irrigation District, as follows: R. H. Ehlers, W. F. Mackey, and A. F. Masterman. Mr. Mackey is a prominent rancher in the Palo Verde Valley, and the other two members are bankers in Blythe.

A. L. Bailey, assistant city engineer of Los Angeles, recently returned from an inspection trip of the work being done on the survey for the Los Angeles Colorado River aqueduct. Surveyors are at work near Beaumont under the direction of Ralph Hamilton and C. A. Pond. Mr. Bailey reported that the work was proceeding excellently.

Members of the Los Angeles city council took advantage of an invitation to inspect the work going on at the Pacoima Dam in the Pacoima Canyon, and made a visit to the dam site on October 3. Those who relished aerial transportation were swung across the canyon in a cage supported on a cable 475 feet above the floor of the canyon.

Judge Frank O. Smith, of Phoenix, Arizona, was recently elected president of the Phoenix Chamber of Commerce. Declaring the purposes of the chamber, he stated on taking office that one of his first objectives as president would be to work for prompt action on the development of the Paradise-Verde irrigation and power project, under which a big tract of land "at the doors of Phoenix" will be opened for settlement.

R. H. Ballard, executive vice-president and general manager of the Southern California Edison Company, addressed the California Real Estate Association, in session during October at Fresno, California, on the subject of the relation of hydro-electric developments to real estate sales. He predicted that development of the Colorado River would permit of a population of 30,000,000 people in the southwest.

H. S. McCluskey, personal representative of Governor George W. P. Hunt, of Arizona, addressed a meeting of the City Club of Los Angeles during October, during which he reviewed the controversy between the various states interested in developing the Colorado River and outlined the policies of Governor Hunt, as Arizona's official spokesman, which govern his attitude toward the proposed developments.

S. H. Hopkins, of Wyoming; D. E. Carpenter, Colorado, and William R. Wallace and George M. Bacon, of Utah, water commissioners of their respective states, were in California during September, conferring with state officials on aspects of the Colorado River problem. They were in conference with Governor Richardson at Sacramento, and with Los Angeles officials and members of the California legislative investigating committee during the coruse of their visit.

Senator Oddie of Nevada, Senator Stanfield of Oregon, and Senator Cameron of Arizona, members of the United States Senate Committee on Public Lands, were in Southern California late in September holding hearings on various questions concerning the public lands policies of the government. At the committee's open hearing in Los Angeles, fires in national forests, grazing on public lands, watershed protection in the southwest, and similar questions were discussed. The committee is holding similar hearings in various parts of the west.

Arthur S. Bent, of Los Angeles, will head a delegation of Southern Californians to the Seattle meeting of the Chamber of Commerce of the United States, December 7 and 8. Mr. Bent is chairman of the program committee and a director of the national commercial body, and a vice-president of the Los Angeles Chamber of Commerce. As president of Bent Brothers, well-known construction engineers and contractors, he is prominent in the irrigation industry. Problems of water conservation and flood control in the eleven western states will be discussed.

An organization of sanitary engineers, conservationists and reclamation engineers was formed in September at Dallas, Texas, committed to the task of purifying the Trinity River and the conservation of its flood waters. More than 150 engineers met at the call of Mayor Louis Blaylock, of Dallas, and formed a permanent organization, to be known as the Trinity River Reclamation and Conservation Association. Officers were elected as follows: T. H. Harbin, of Dallas, President; John J. Simmons, Dallas, first vice-president; W. C. Weeks, Tarrant County, second vice-president; O. E. Carr, Fort Worth, third vice-president; J. E. Surratt, Dallas, fourth vice-president; E. J. Noyes, Dallas, secretary and treasurer.

After a tour of the Kittitas Valley and the site of the future Kittitas high-line canal, Congressman Louis C. Crampton, of Michigan, member of the House Committee on Appropriations, and chairman of the subcommittee on Interior Department deficiencies, left for Ranier National Park with an expression of great satisfaction at the conditions observed. Congressman Burton L. French, of Moscow, Idaho, also a member of the subcommittee, Congressman Addison T. Smith, of Twin Falls, Idaho, and John W. Summers, of Washington, D. C., accompanied Mr. Crampton on his visit. The congressional party was conducted over the valley by F. A. Kern, Ora McDermith, Bruce Bonney, and J. L. Lytel, prominent figures in Washington reclamation circles.

Why
PEERLESS PUMPS
are best for Municipal Water Supply!

Below is an illustration of our latest installation for the City of Pasadena, California . . .

DEPENDABLE water supply being highly essential to municipalities, it naturally follows that the choice of engineers who have thoroughly investigated the functions dependent upon efficient pumps, specify PEERLESS PUMPS to insure satisfactory service with the least possible maintenance expense.

Municipalities that are Using PEERLESS PUMPS—

City of PASADENA
City of COVINA
City of LA VERNE
City of MANHATTAN BEACH
City of SANTA ANA
City of INGLEWOOD (3)
City of GLENDALE (3)
City of BURBANK
City of VERNON

RECLAMATION

NEW REGULATIONS ISSUED FOR SELECTION OF SETTLERS

REGULATIONS for the selection of settlers on Federal irrigation projects, in accordance with the terms of the reclamation law enacted by Congress in 1924, have been approved by Secretary Work and will be put into effect.

The regulations provide that applicants for irrigated farms must be in vigorous health with a minimum capital of $2,000 or its equivalent in farm equipment or live stock, and have at least two years actual experience in farm work. They also provide for the appointment on each Federal reclamation project of a local Examining Board of three or more members upon which will be vested the duty of selecting the best qualified applicants for all farm units available for settlement. The regulations provide, in part:

"Hereafter no entry for public lands within a Federal irrigation project shall be accepted by the local land office until the applicant therefor has satisfied an Examining Board, to be appointed on each project to consider such matters, that he is possessed of such qualifications (in addition to the qualifications required under the homestead laws) as to industry, experience, character, and capital, as in the opinion of the Board are necessary to give reasonable assurance of success by the prospective settler.

"Each applicant for entry of such public lands, including preference right ex-service men, and successful contestants under the act of May 14, 1880 (21 Stat., 140), shall file an application with the Bureau of Reclamation which, among other things, must state with respect to the applicant, his or her age, status as to citizenship, whether married or single, number of children, and their sex and ages, other dependents, ownership of farm lands elsewhere and the value thereof, farming experience, assets and liabilities, and give references as to character and industry. The application may state the particular farm unit desired and may also include a second and third choice and, when practicable, the choice of a fully qualified applicant will be approved. However, the intent of the law is to select the best qualified applicants for all farms available and the government must therefore reserve the right to distribute the farms to those best qualified, regardless of individual preferences.

"APPLICANT must possess good health and vigor and have had at least two years actual experience in farm work and farm practice. The applicant must have at least 2,000 in money, free of liability, or the equivalent thereof in live stock, farming equipment, or other assets deemed by the Examining Board to be as useful to the said applicant as money.

"The above minimum requirement as to capital and experience shall not apply when the farm (fractional farm unit) applied for is 10 acres or less in area and the applicant can show to the satisfaction of the Examining Board that the development of the farm is feasible from the capital the applicant may reasonably be expected to obtain as a wage-earner.

"An Examining Board of three members, or more, shall be appointed on each project by the Secretary of the Interior, or such officier as he shall authorize to make such appointments, to consider the fitness of applicants to undertake the development and operation of a farm. The members of such Board shall serve for a period of one year, or until their successors are appointed, unless otherwise ordered by the Secretary or such officer as he shall authorize to make such appointments. Each superintendent is requested to submit recommendations for membership on the Board of Examiners for his project at the earliest practical date."

THE EXAMINING Board, it is provided, shall interview the applicants who appear before it, to determine the qualifications of prospective settlers. Careful investigation shall be made to verify statements and presentations made by applicants to the end that no misunderstanding may prevail either as to the applicant's fitness or his appreciation of the problems before him.

The Board's decision as to the relative qualification of each applicant, based upon a percentage rating of the elements of industry, experience, character, and capital, shall be final unless appeal from such decision be made to the Secretary of the Interior within 30 days from receipt of notice, and such appeal should be filed in the project office where the lands are situated.

The relative standing of applicants will be based upon a percentage rating, weighing industry, experience, character and capital according to the following scale:

Industry	*Per Cent*
Fair	5
Good	15
Excellent	25

Farm Experience	*Per Cent*
2 yrs. or more in East	15
2 yrs. or more in irrigation	25

Character	*Per Cent*
Fair	5
Good	15
Excellent	25

Capital	*Per Cent*
$2,000	15
3,000	20
5,000	25

Approval by the Board of an application, followed by the filing of water right or water-rental application, when either is provided for on the particular project involved, which feature the Board shall cover by appropriate notation on the application, will entitle the applicant to file homestead application at the designated local land office for the farm unit assigned to him.

These regulations relate in the main to the entry of vacant farm units upon existing projects and existing divisions thereof.

Each public notice or order opening new projects or new divisions, however, it is explained, will contain detailed instructions on the subject of the qualifications necessary for prospective entrymen and the procedure under which such qualifications will be determined.

The regulations were approved by the Secretary of the Interior on the recommendation of the Commissioner of Reclamation and the Commissioner of the General Land Office.

"We Seek Simply a Sound Economic System" Says Commissioner Mead

"AN ERRONEOUS impression seems to prevail," says Elwood Mead, Commissioner of the Bureau of Reclamation, "that there has been needless delay or opposition to carrying out Reclamation projects for which appropriations have been made by the last Congress."

Commissioner Mead further stated that the Reclamation Bureau desires to carry out the purposes of the Reclamation Act of December, 1924, and to build projects wherever a sound economic development is assured. It is unwilling, however, to begin the construction of any project until arrangements have been made which will comply with the law and insure contented and prosperous homes when those projects have been built. Continuing, he said:

"The situation on old projects, the investigations of the Fact Finders' Committee, and the hearings of the last congress make it evident that there had been too great haste in the past in beginning construction. Failure to settle in advance all the questions which a project presents has resulted in controversies with irrigators which embitter the relation of the government and water users after a lapse of 20 years. Another reason for care is the fact that construction costs of new projects are from two to three times what they were 15 years ago and when all the older projects were built. It becomes a serious question, therefore, whether the value of water in production will equal its cost and this needs to be carefully studied. The great war has doubled the cost of improving and equipping farms and it is necessary that settlers be informed of the capital they will require and that conditions necessary to enable them to make a comfortable living and repay the money invested by the government be provided.

"The greater part of the land on new projects is privately owned. Some owners hold large tracts. The law requires that these owners shall organize irrigation districts and shall contract to repay the government all the money spent and that the land they hold in excess of a homestead shall be appraised and the price at which it shall be sold to settlers shall be fixed. Negotiations to perfect these arrangements take time.

IN SOME cases, delays are due to the people most concerned. The Salt Lake basin project in Utah is an illustration of this. The government has had its plans and estimates for this work ready for months. The land that is to be irrigated is all settled and the farms on which it is to be used are highly improved but they have an inadequate water supply from private ditches. The price to be paid for water is satisfactory, but the local organization, which includes some of the ablest business men in the state, has not been able to organize the water users and make the necessary financial arrangements to insure the repayment of $3,000,000 that the works will cost. Like prudent men, they are taking time to determine what they ought to do. The Bureau is willing for them to take this time but desires the public to understand the causes of the delay.

"On the Vale, Oregon, project the contract for the purchase of water may have to be confirmed by the courts before the money is paid and construction begins.

"Because of the high construction costs of these new projects, which are the highest of any government irrigation works in any country, Congress required in the appropriations for four projects that the state should undertake the settlement of the land and help finance the development of farms. None of the states in which these projects are located has as yet seen its way clear to assume this financial responsibility.

"It is believed that an understanding of conditions on old projects and the problems which confront new ones will justify the actions of the Bureau in its efforts to place the operation of old works and the development of new ones on a sound economic basis. With such understanding and the cooperation of Congress and local interests, plans now so well under way will insure without interruption the irrigation development of the West."

Survey New Mexico Stream

Acting under authorization by the 1925 legislature, the office of the state engineer of New Mexico has begun a preliminary survey of the Gila River, in Grant and Hidalgo counties, with a view to utilizing these waters for the irrigation of lands adjacent to the river. The sum of $10,000 was appropriated by the legislature, and engineers from Santa Fe are now in the field making the survey. Storage reservoir sites, their potential capacities, and the amount of sub-surface water available, will be investigated and borings made for dam sites.

For Detailed Listings, Branch Offices, Etc., See the Buyers' Guide to Leading Supply Sources—Pages 55-56

The Columbia Basin League's Aims and Ambitions

(Continued from Page 16)

of supplying water. The State Department of Conservation and Development, through power given it by the state constitution and the land settlement act, is prepared to take necessary action to prevent speculation and exploitation of the settler on Columbia Basin lands.

"It is highly desirable that the project lands shall be placed in the hands of owners rather than renters. On the 80-acre unit plan of dividing the project, the area will provide 24,000 farms, supporting a rural population of at least 120,000, and a similar population increase in cities and towns developed on the area. The benefits to cities outside of the project will assure a total increased population to the Pacific Northwest of half a million people."

In addition to irrigation possibilities the project also has large power possibilities.

ALONG the distribution canals are numerous drops where power can be developed. On the project 30 such power sites were selected by the engineers as practicable. The combined installed capacity of the 30 plants is 145,000 horsepower. The average cost is $58 per horsepower. Two of these plants will furnish all the power required for secondary pumping.

"When, and as, these power possibilities are developed the net returns from power sales should be applied to the retirement of the capital cost of the project," says the government engineering report, which places the total construction cost at $295,000,000.

Before government engineers made a complete investigation of the project, General George W. Goethals of Panama Canal fame was induced by the Columbia Basin Irrigation League to make a study of the proposed project. One paragraph of the general's report gives a concrete idea of his opinion.

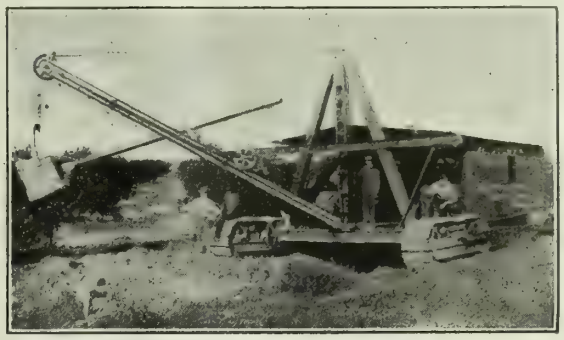
"Though located in the state of Washington, the benefits from the Columbia Basin project will not be confined thereto, but will extend to all parts of the United States. Through it pace will be kept with the ever-increasing demand for food stuffs of all kinds. It required vision to conceive the project; far less imagination was needed to picture the benefits that will accrue to the entire country through its realization."

Irrigation is permitted on the Elephant Butte, New Mexico district, during the last fifteen days of the month only, during October, November and December.

For Cleanout -- Maintenance -- New Ditches

There's a Bay City for Every Job

BAY CITY Land Dredges span the ditch, can dig any desired slope, and dump waste on both banks. BAY CITIES leave clean, wide berms, and can work up or down streams. One trip over the ditch is enough. The Shovel Type Dipper handles hard material in which other types of buckets cannot make a good showing.



At left—One yard BAY CITY Dredge digging and cleaning ditches in Florida Citrus Groves.

BAY CITY Land Dipper Dredges are built to fit the job. Walking, Crawler, Track or Floating mounting. Easily dismantled, transported and assembled. Capacities ½ to 1½ cubic yards. Oil engine or electric operation.

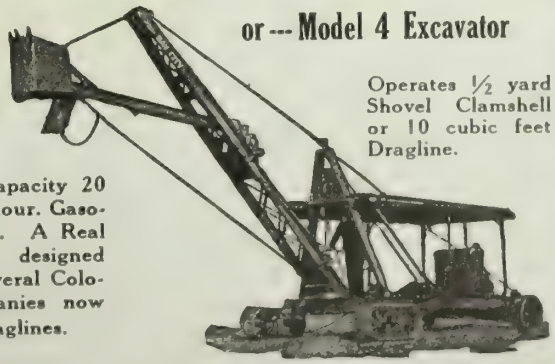
FOR SMALLER DITCHES — OR PIPE LINE TRENCHES

The BAY CITY 16-B convertible Excavator will handle a wide range of work. Operates Dragline, Trench Shovel, Clamshell or Skimmer. All steel. Shipped assembled. Digs any width or depth up to 20 feet.

Model 16-B Trencher—Excavating for Sewer.

or --- Model 4 Excavator

BAY CITY Model 4 is a small low-priced convertible, one-man operated Excavator. Fills the gap between hand labor and high priced equipment. Capacity 20 to 40 cubic yards per hour. Gasoline or electric power. A Real Digger economically designed for the small job. Several Colorado Irrigation companies now operating Model 4 Draglines.



Operates ½ yard Shovel Clamshell or 10 cubic feet Dragline.

Our many years experience in manufacturing and operating Dredging machinery is at your service. Write us about your problem.

IRRIGATION FINANCE

CREDIT MAKES OR BREAKS AN IRRIGATION DISTRICT

By JOHN DWIGHT NEALE

THE bright star of future greatness, for Western America, lies not in her mines, her forests, her fisheries, her oil fields, her commerce, or her industries. They are all of much importance, but must be supplemented and sustained by an irrigated agriculture.

It therefore is evident to thinking people that definite reclamation policies for Western America should be outlined and followed; that credit for irrigation financing must be created and conserved.

Changing national or state administrations should not affect reclamation policies. The idea of one administration making political thunder by criticism of its predecessor's reclamation record is a great business and credit mistake and, pursued for a time, ruins the credit of all irrigation undertakings, regardless of their merits.

WHEN the irrigation bond holder hears the uproar, smells the brimstone stirred by the muck-rake and views the political carnage, as set forth by a press anxious to publish "news" from the seat of action, he does not know it is only a "game of politics." He thinks it is "real stuff." He takes at face value what he reads and hears. He believes the bottom has fallen out of irrigation ditches, reservoirs and bonds.

He believes that the bond dealer who sold him the bonds lied when he told him irrigation was a constructive work, making two blades of grass grow where one or none grew before. He has little opportunity to obtain the facts surrounding the situation; therefore, he hastens back to the bond dealer from whom he purchased the irrigation bonds and tries to sell them.

By this time, the bond dealer has had so much difficulty in endeavoring to keep old customers sold on the issue and new customers found for the bonds he buys back, that he, too, believes that State a good one to avoid in future credit extensions.

Thus, the credit of irrigation districts suffers and with it every borrower in the state where it is located.

HERE are a few examples of how a poor credit rating affects the whole, when a part, for a time, has an unfavorable reputation:

Certain states of the union, for a given reason, about 60 years ago saw fit to repudiate a part or the whole of their state debts. Some cities have done likewise. The summer suns and the winter winds of 60 years have not yet entirely dissipated the unfavorable credit reputation which every municipality within those states gained through this unwise action.

THIS article consists of selected excerpts from a very comprehensive paper on "The Effect of Credit on Irrigation Development," read before the Oregon Irrigation Congress by the author, John Dwight Neale. Mr. Neale is connected with the J. R. Mason Company, of San Francisco, specializing in irrigation securities; and he is the author of several well-known treatises on various financial aspects of reclamation and irrigation. Mr. Neale expects to publish the entire paper, of which this article is a part, in booklet form.

The sums avoided and the debts evaded were a bagetelle compared to the added rates paid, and the premiums missed, during all of these years, whenever any political subdivision of such a state sought outside credit from money centers.

The Book of Proverbs says: "A good name is rather to be chosen than great riches and loving favor rather than silver and gold." This shows that the value of good credit ratings was fully appreciated in ancient times.

Cities issue what are termed Improvement District Bonds. They are usually obligations of the District or of the proptery affected, but ostensibly obligations of the city. About fifteen years ago the Supreme Court of Oregon held that these bonds are obligations of the city, and the "Bancroft Act" bonds, issued under this decision and law, are payable from the city treasury while the city, in turn, collects from the property benefitted.

The effect of this wise interpretation has saved Oregon towns and cities hundreds of thousands, if not millions of dollars. These one to ten-year installment payment 6 per cent bonds have sold at substantial premiums, practically all the time, regardless of the investment market. I have presented bids on these bonds to bring the rate down to 5 per cent to the city.

I have never seen an instance in Oregon where a town could not sell its Improvement Bonds. This illustrates what a "good name" will do for a state and its people.

I HAVE heard that in a neighboring state to Oregon a court decision was at one time rendered, explicitly inhibiting the payment of Improvement District Bonds from the city's general treasury, which, if true, practically means that the bond holder is told to collect from each individual piece of property within the District, or lose his money. The credit results of such an interpretation certainly could not have been foreseen by its proponents.

City improvement district financing of that state has cost terrific penalties—seven per cent bonds turned to contractors have, in turn, been sold by the contractors at very heavy discounts.

It doesn't take many bad moves nor very long for an individual or a state to lose its good name and its credit.

ABOUT twenty years ago a neighboring state to Oregon, almost wholly dependent upon irrigation for

agricultural growth, developed a great wave of reclamation enthusiasm. It seemed so reasonable and economically sound a principle that big business and big bankers of the eastern credit centers brought large sums of money into that state with which to carry on reclamation work.

Some of the enterprises were wisely planned and honestly and ably completed. They were a great success and the bond holders had their interest and principal paid promptly when due.

Other enterprises were less fortunate. They caused some loss to bond holders and inestimable loss to the state. Little new development was possible for a dozen years, because irrigation securities had no credit standing. The population of that state advanced but very little in a decade. Every borrower in the state was affected adversely when he sought large credit in money centers.

Time heals many wounds and gives opportunity for the birth of a new and credulous class of bond dealers and investors. Therefore, about a half dozen years ago numerous irrigation districts began to be formed to take over the old enterprises or to create new ones.

Certain bond dealers began again gradually to approach irrigation securities of that state, the examples of great success where irrigation had been practiced were so apparent, and the purposes and promises of the promoters so plausible, that they were led forward again to the business of gradually opening up the resources of the state for the use of many, through the extension of credit to its irrigation districts.

IT BEGAN to look like that state would again soon be able to demand credit as required on its irrigation district bonds.

Then some reaction in the price of farm crops came along and irrigation district bonds, in numerous localities, throughout that state, began to go into default.

The immediate result of this last unfortunate experience may readily be seen —viz: the almost utter collapse of a secondary market for any of the outstanding bonds and the slipping back into the dark ages of history for irrigation district credit in the minds of numerous well-intentioned bond dealers and investors who really had an honest purpose and a worthy vision in extending credit to them.

I personally know conditions in that state well, and believe that this last credit collapse of many irrigation districts was unnecessary and will hold back development there for a generation. If the credit position of these defaulting districts had been maintained by the state itself, if necessary, millions of capital and thousands of people would, in my judgment, have been interested in going into new irrigated areas, and in driving the desert back, through the building up of farm homes.

IRRIGATION has placed California at the head of all western states in value of crop production and very near the top in the entire nation. It has been the chief factor in the rapid increase of her population during the last decade for, after all, "climate" alone does not attract people in large numbers to live in a desert.

Los Angeles County's climate, mixed with irrigation water, has placed that county at the head of all counties in the United States in the annual value of crops produced. California's future growth in financial importance and in population is only limited by her ability to gradually cover many more millions of acres of land with irrigation water and to reduce the units of land ownership to the point of greatest economic and social advantage.

In the early history of irrigation development in California some unfortunate projects were undertaken and some loss ensued.

The results affected development of irrigation in the state for many years, and only since a new law and an awakened consciousness of what irrigation means to an arid state has the real development of California taken place. California will never suffer the credit position of her irrigation securities to be seriously impaired again, as the $200,000,000 now invested in irrigation development within the state is less than the average value of one year's single crop raised by irrigation.

Moreno Bonds Approved

The way was opened for the sale of $175,000 in bonds issued by the Moreno Mutual Irrigation Company (California) by the decision of the California Supreme Court, given during September, that the bonds had been legally issued. The bonds were held up by the California Secretary of State on the ground that the directors had not met in the proper place when they passed the resolution authorizing the bond issue. The company was successful in getting the supreme court to assume direct jurisdiction in the case, and were vindicated by its decision. Money from the sale of the bonds is to be used for the installation of 33,000 feet of pipe-line, reservoirs and a distributing system.

Equipment Dealers Face Problem in Handling Used Pumps

(*Continued from Page 19*)

wants to make the sale, and he finally plunges the extra $160. Perhaps he figures that some of the random-length pipe or the rusted fittings can be used in some way which, up to the present, he has never discovered. He forgets that, at one-half cent per pound, junk price, it would take a considerable tonnage of pipe and fittings to total up $160.

"We can't blame either one of these men. Certainly the irrigator isn't at fault in wanting the best possible terms. The purchaser of pumping equipment is merely proceeding along the lines that have been laid down for him by all too many manufacturers and dealers with whom he has come in contact. He doesn't know that Johnson is sacrificing his legitimate profit to make the sale. He merely knows that he gets a better price if he lets the dealers bid against each other.

"The irrigation equipment industry is, itself, at fault in this matter. It does not present a united front, and, until such time as it does, the dark shadow of the sheriff will hover over many a threshold, and the closing chapter to the story of numerous supply ventures will be written on a legal form supplied by the county."

This is the problem that has proved such a trying one to the Western Irrigation Equipment Association. Its members believe that it is taking steps in the direction of its solution in presenting the recommendations that have been decided upon by its committee.

THE Association's committee recognizes, of course, that there are instances where it would be not only unjust, but economically unsound business practice, to refuse to make a good allowance on equipment that has been used, and which, for special reasons, must be disposed of while there is still a long period of useful service to be obtained from it.

Some of the most noteworthy examples of this are easily pointed out. Pumps are sometimes purchased for use on land that normally has a high water table, and after the equipment has been installed, the water sinks to a level that makes it necessary to replace horizontal pumps with deep well types. Or, perhaps, a well is judged capable of handling a ten inch pump, but after a short time it is found that it will have to be replaced by a smaller size in the interest of most economical operation.

If all of this equipment were left on the hands of the irrigators, it would work untold hardships on them as individuals, sometimes as whole districts. The necessity here arises to find some way to take in this material, appraising it at its full value, and make it available for use in other territories, or on other projects, where it can serve out its period of maximum usefulness.

This solution lies in the hands of the dealers, declare the Association's leaders. There is an ethical and legitimate demand for second-hand or slightly used equipment in the irrigation industry. And if the purchaser feels he must have used equipment, quite likely he will follow his inclination and purchase what he wants, arguments in favor of new pumps notwithstanding. It is better, then, since this trade exists and will probably continue to exist, that it go through the regular legitimate channels of trade.

BUT the committee would emphasize that dealers who decide to engage in this phase of merchandising must be doubly cautious, lest they be caught unawares. They must realize that trade-in equipment may never be salable in their own immediate territory again, and accordingly should have means of disposing of it in other fields. They must be cautious that they do not, by dumping used equipment on their own market, demoralize it, and disrupt the regular demand for new goods.

"Second-hand" does not mean junk. A second hand pump is a piece of equipment. Second hand pipe and fittings are junk, and should not be bid in except on that basis. (This does, of course, refer to re-conditioned pipe, which should be classed with factory re-built merchandise.)

The whole plan, to be made operative, hinges on two things, however, it is believed. The manufacturer must not take back any equipment whatsoever for the purpose of stimulating sales, and the dealers must refuse absolutely and in every instance to make any concessions beyond the second-hand resale value of the article.

The magnitude of the irrigation industry is only beginning to be realized, and as the industry grows, the pump industry, an essential and integral part of irrigation, must also grow. But no industry has ever been known to thrive on red ink balances in the ledger, and no individual has ever been known to squeeze through the gates of the Hall of Fame on business "done for fun."

A $300,000,000 Project

may stagger the imagination of one who is not intimately in touch with hydro-engineering activity of Western America.

Yet this gigantic enterprise is but one of many under contemplation, at this time, in the field and market covered by MODERN IRRIGATION. Not nebulous schemes of promoters and visionaries, by any means, but projects that have been surveyed and approved by engineers of international repute.

In 1920 irrigation, drainage and excavating contracts exceeding $25,000 amounted to only $16,220,000 in the United States while "water works" contracts, so called, in that same year, totaled approximately $30,000,000. In 1924 irrigation and drainage contracts (over $25,000) had increased to $48,147,000—upon competent authority—while "water works" contracts had mounted to a total of $65,453,000 for the year.* At this writing, several water development projects are pending in the irrigation country of the west, any *one* of which, when carried out, *will exceed in cost the grand total of all contracts of like character awarded in 1924.*

"The Western country of America," said an eminent engineer recently, "will, in the coming few years, see the greatest engineering developments the world has ever known." MODERN IRRIGATION expects to have an active participation in these nation-building enterprises. As the editorial voice of the reclamation movement and the recognized clearing house of information upon every phase of hydraulic activity, it will be in a position to wield a unique influence—a fact that far-sighted advertisers have already been quick to grasp and to capitalize.

The time to identify yourself, and your concern, with MODERN IRRIGATION and the principles which it stands for is *now*. There is, too, a distinct advantage to be gained by doing so.

*To these figures should be added approximately 100 per cent to give a total of all contracts, of this character, awarded in the U. S., including much work done by hired labor direct, which is not covered by these statistics.

For Detailed Listings, Branch Offices, Etc., See the Buyers' Guide to Leading Supply Sources—Pages 55-56

OVERHEAD IRRIGATION

NO, THE OVERHEAD ENGINEER ISN'T AN AVIATOR

By HUGH CRANE

INTRODUCING irrigation's newest division of labor—the overhead irrigation engineer. He's not simply one of the better known kind of irrigation engineer who has taken up flying, either. He is one who specializes—exclusively—on the work of applying the science of overhead sprinkling to the orchard.

I had a talk this morning with Albert E. Harris, specialist in overhead irrigation and pressure water systems, a representative of the new profession.

"There's more to it," said Mr. Harris, "than one might imagine. Casually, one might think that it meant merely the cutting up of a few odd lengths of pipe, the installation of sprinklers at proper intervals, and then turning the water on. It can't be done that way. The engineer who specializes in this branch of the work must know trees and soils, first, for an understanding of their requirements and their behavior under varying conditions; second, he must know materials, both from an engineering point of view and from a commercial point of view; and, of course, for success, he must thoroughly know men, for he must meet men as clients and potential clients, and must handle men in getting all branches of his work accomplished.

"He must bring together in use the products of three large and complicated industries, each of which has independently advanced to a point undreamed of by those not in actual touch with them. The first is the great pump industry—he must know pressure problems, and have a wide acquaintance with pumps and their manufacturers. The second is the sprinkler industry—not so large, but in itself a very considerable business. The third is the pipe industry — he must know in detail the theory and practice of pipes and hydraulics. All this calls for a wide variety of practical and technical knowledge."

SEVERAL integral steps," Mr. Harris says, "must have their due place in any given job that the overhead irrigation engineer takes up. The first is to make a complete engineering survey of the problem. Having been called in by a rancher and asked to figure on installing an overhead system on a tract of forty acres, for instance, the engineer can not take a quick glance at the property, jot a logarithm or two on his cuff, and name a price. His method of procedure is first, to make a field reconnaisance of the land in person, taking into due account such conditions as the abutting property, prevailing winds, and other similar matters which do not bother the draftsman because they don't exist on the drawing board, but often do annoy the overhead irrigator signally when his system is installed and operating. Then, with contours and complete data on the soil conditions, spacing of trees and tree-tops, he completes his estimate of the job and submits it to the owner."

ALBERT E. HARRIS

The cost does not depend on the acreage alone. It will be determined very largely on such factors as the pressure desired, the amount of water to be delivered, the arrangement of trees, and the availability of an adequate water supply.

If the estimate is approved, the next step is still another technical matter, calling for the skill of the engineer and his assistants. An engineering layout of the property is made to guide the installation of the system.

This layout is supplemented with complete engineering specifications and the necessary agreements between the contractor and the owner. Checked up and approved, it forms the basis for the next step, which is the actual construction work.

MR. HARRIS now has twenty-four men working for him, including both his draughting department and his construction workmen. They can handle, if pushed to capacity, about three acres a day. With the addition of three more men, he declares, he would be able to handle five acres per day of installation. A big gang, trained for rapid work, is necessary because installations must be completed in the interval between irrigations. A recent installation on a forty-acre tract was finished in twenty-four days.

"How did you become interested in taking up this particular branch of the business?" I asked Mr. Harris.

"For a number of years I have been working with hydraulic problems, in the pump business," he replied, "but the thing that first attracted my attention to the potentialities of the overhead sprinkler systems for orchards was the benefits possible thereunder in frost protection. I remember, when I was a child, seeing my grandmother ward off frost damage by sprinkling her tender and cherished plants outside the door with a watering pot. I was familiar, too, with some of the common phenomena connected with

CAMPBELL
OVERHEAD IRRIGATION

DISTRIBUTES the water applied in the form of small drops just like a gentle rain—not in a mist that will be lost by evaporation or in a deluge that will wash the soil.

Gives a 100% distribution over the entire area irrigated. Apply an inch or less of "rain"; let it stand for a few hours and dig where you will and not a spoonful of dry earth can be located.

Requires less than half the water necessary for the ditch or furrow system where there is an immense waste on account of varying texture of soil and run-off.

Affords an immense saving in labor. Simply open the valves and let it "rain" on a section of one, five or ten acres for a few hours—then shut off and turn on another section. No furrowing needed in advance of irrigating.

Obviates the necessity of terracing and contour planting—even on the steepest hillsides. Trees can be planted square and every drop of water applied will soak in.

Prevents and disintegrates plow-sole—thus making sub-soiling and deep cultivation unnecessary.

Absolutely prevents damage from wind-burn. Moisture carried by the wind will entirely check evaporation from the leaves and fruit.

Saves the expense of spraying for red spider and other insects and by keeping the trees in a healthy condition will make all, or practically all, fumigation unnecessary.

Prevents June drop by eliminating the evaporation from the trees that causes it.

Gathers nitrogen from the air and forces downward- distribution of nitrates and soluble parts of manure that have been applied near the surface. It also carries humus in solution below ploughed depth to all deep-lying roots.

We make complete guaranteed installations including pumping equipment for boosting machinery if desired or will sell you the necessary equipment, make your plans and superintend installation.

BOOKS *of* PRACTICAL VALUE *to the* WATER USER *and the* HYDRAULIC TECHNICAL MAN

IRRIGATION ENGINEERING

By ARTHUR POWELL DAVIS, D. SC.

Chief Engineer and General Manager, East Bay Municipal Utilities District; formerly President Am. Soc. C. E.; formerly Director and Chief Engineer, U. S. Reclamation Service.

AND

HERBERT M. WILSON, C. E.,

Mem. Am. Soc. C. E.; former Chief Engineer and Irrigation Engineer, U. S. Geological Survey.

Seventh Edition, Revised and Enlarged; Total Issue 12,000

THIS IS a rewritten and rearranged edition with much new material added. The principal difference introduced is the treatment of soils, plant food, operation and maintenance, and other lines of work where the duties of the irrigation engineer come in contact with the irrigator, such as in the preparation of land, the duty of water and its application to the land. A bibliography of standard works is given at the end of each chapter. 640 pages. 6 by 9. 249 figures and illustrations. Cloth, $4.50 net postpaid. Remittance must accompany the order. Allow from one to two weeks for transmittal of order and shipment from the publishers.

IRRIGATION PRACTICE *and* ENGINEERING

By B. A. ETCHEVERRY,

Professor of Irrigation Engineering, University of California.

In three volumes—the most comprehensive work in the field. A wealth of information of both practical and informative value for everyone interested in water development and conservation. Prices are net postpaid and remittances must accompany order. Allow from one to two weeks for transmittal of order and shipment from the publishers.

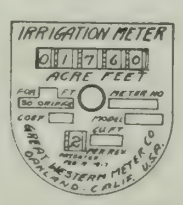
Vol. 1.—Uses of Irrigation Water and Irrigation Practice.....$2.50
Vol. 2.—Conveyance of Water..... 4.00
Vol. 3.—Irrigation Structures and Distribution System..... 4.50

Address all orders to

Book Dept., MODERN IRRIGATION

626 So. Spring St. Los Angeles, Cal.

A GREAT WESTERN *Irrigation Meter*



will solve your measurement problems

It is on the job day and night. It is not affected by silt or trash. Meter is geared for orifice of any size (1-10 sq. ft. to 100 sq. ft.)

GREAT WESTERN METER COMPANY

1290 Powell Street

Oakland California

frost protection on a larger scale by making use of the same principle. After some disastrous freezes in Southern California, I began investigating the practical possibilities of adapting this method to citrus growing.

"Out of these investigations there came wider familiarity with sprinklers and sprinkling systems, and I found to my surprise that the frost protection aspect, while undoubtedly an important one, doesn't represent more than two per cent of the benefits to be derived from 'overhead'. And so I entered the business."

SOME of the jobs which Mr. Harris has recently completed or is now working on include some fine examples of citrus properties, and will afford splendid opportunities to make accurate check on the results of overhead irrigation as compared with former methods.

He is now beginning the actual installation work on a 40-acre tract of citrus at Glendora, California, owned by W. E. Glidden, wealthy resident of Beverly Hills.

He is also working on an installation for a ten-acre tract at Glendora for C. M. Johnston. Mr. Johnston's ten acres of citrus are all "pedigreed trees", and supply bud stock for some of the finest trees in Southern California. Complete individual tree performance records are kept on this ranch,, and within a short time will reveal, undoubtedly, interesting data on performance under overhead irrigation.

Several other Glendora citrus ranchers have seen examples of Mr. Harris' work and have given him contracts on their ranches. One of these was for 7 acres for E. C. LaFetra. Frank H. Browne is having an installation put in on ten acres. H. C. Warren and Henry King recently had small acreage converted to "overhead". C. G. Washburn has ten acres fitted out with the artificial rain. W. L. Downes, six acres, and Harry Beckwith, 12 acres, are other Glendora growers who have called in the rainmaker, new variety.

Dr. Vincent Baker, of La Verne, has recently installed overhead on 10 acres and plans to apply the new system to forty acres more. H. B. Jones of Claremont has ten acres so equipped. This ranch is an interesting one because it recently won high honors for its lemons at the Southern California fair, and it irrigates three times a month, on account of the unusual thinness of the soil. "Mr. Jones' land," said Mr. Harris, "has a soil of only about eighteen inches in depth. On such soil overhead sprinkling is the rancher's salvation, and irrigation is practically continuous there."

For Detailed Listings, Branch Offices, Etc., See the Buyers' Guide to Leading Supply Sources—Pages 55-56

W. I. E. A. Elects Officers

(*Continued from Page 12*)

greatest needs. Our agreeable contact with the new and up-to-date publication MODERN IRRIGATION should assist us greatly and we should assist it and ourselves by working for its wider circulation.

"Yet another method of spreading our message would be through a wider circulation of our data book. We have requests from all over the country for this data book, but our aim is to supply reliable information to irrigation interests in our own territory.

"In conclusion, your president extends his sincere thanks for the past year of individual and cooperative effort for the common good and hopes that such effort and interest may continue and increase."

OF SPECIAL interest to the Association is the work being carried on by a joint committee composed of members of the W. I. E. A. and the California Committee on the Relation of Electricity to Agriculture. This committee is occupying itself at present with the task of working out a standard guarantee that will be satisfactory and fair to both manufacturers and consumers. To date only tentative recommendations have been made but they show, in the main, several policies that will serve as a guide in the formation of the new standard form of guarantee.

Among other things, it is to be recommended that the users have their wells tested before buying any pumping equipment. This, in itself, if it becomes a universal practice, will do away with much of the controversy over so called non-fulfillment of guarantee. Ten percent leeway is to be allowed the manufacturer on his pump rating where a test is made.

Tests must be demanded by the user within ten days after installation, and they will be made by a neutral third party, according to the present plans. The cost of the test is to be borne by the manufacturer of the pump if his equipment fails to prove up to rating, and by the purchaser if it shows the guaranteed volume of water. Changes will be made in these plans, and the committee emphasized that they must not be considered final. They are merely intended to show the general lines that the recommendations will follow.

The evening banquet of the Association was an unqualified success, with Milton Ferguson, State Librarian, acting as toastmaster, and J. E. Huntoon, president of the People's Bank, Sacramento, and president of the California Bankers Association, as the principal speaker.

SURVEY *of* IRRIGATION DEVELOPMENT

As Shown by Official Records of the Month -- Local, State, and Governmental

RECORDS SHOW LARGE DEVELOPMENTS ARE PENDING

AMONG the more important permits to appropriate water issued by the Department of Public Works, Division of Water Rights of California, during the month of August, 1925, were the following:

Permit No. 2184, Application No. 4153 (Siskiyou County). Issued to Joe Franklin, John and Joe Quadros, Ager, California, August 8, 1925, for 2.80 cubic feet per second from Bogus Creek in Sec. 13, T 47 N, R 5 W, for irrigation of 224 acres near point of diversion. Estimated cost $1000.

Permit No. 2187, Application No. 4464 (Sacramento County). Issued to Geo. M. Mott, Jr., Rio Linda, California, August 12, 1925, for 0.41 cubic foot per second from Linda or Dry Creek in Sec. 22, T 10 N, R 5 E, for irrigation of 33 acres in Sec. 22. Estimated cost $1500.

Permit No. 2190, Application No. 4312 ((Glenn County). Issued to Raymond Houx, Colusa, California, August 18, 1925, for 5.42 cubic feet per second from Sacramento River in Sec. 18, T 18 N, R 1 W, for irrigation of 216.8 acres near point of diversion. Estimated cost $4500.

Permit No. 2191, Application No. 4313 (Glenn County). Issued to Annie McVay et al, Butte City, California, August 18, 1925, for 2.70 cubic feet per second from Sacramento River in Sec. 18, T 18 N, R 1 W, for irrigation of 108 acres near point of diversion.

Permit No. 2192, Application No. 4314 (Glenn County). Issued to Arthur L. Kerr, et al, Oakland, California, August 18, 1925, for 4.48 cubic feet per second from Sacramento River in Sec. 18, T 18 N, R 1 W, for irrigation of 270 acres near point of diversion.

Permit No. 2193, Application No. 4315 (Glenn Count). Issued to Irwin N. McVay, Princeton, California, August 18, 1925, for 5.11 cubic feet per second from Sacramento River in Sec. 18, T 18 N, R 1 W, for irrigation of 204.6 acres near point of diversion.

Permit No. 2194, Application No. 4316 (Glenn County). Issued to Grace McVay and Virginia McVay, Berkeley, California, August 18, 1925, for 6.64 cubic feet per second from Sacramento River in Sec. 18, T 18 N, R 1 W, for irrigation of 265.8 acres near point of diversion.

Permit No. 2195, Application No. 4317 (Glenn County). Issued to Ernest I. Williams, Colusa, California, August 18, 1925, for 1.9 cubic feet per second from Sacramento River in Sec. 18, T 18 N, R 1 W, for irrigation of 76 acres near point of diversion.

Permit No. 2196, Application No. 4318 (Glenn County). Issued to Emil Jacobson, San Francisco, California, August 18, 1925, for 2.62 cubic feet per second from Sacramento River in Sec. 18, T 18 N, R 1 W, for irrigation of 105 acres near point of diversion.

Permit No. 2197, Application No. 4319 (Glenn County). Issued to Malvina E. Williams, Princeton, California, August 18, 1925, for 4.57 cubic feet per second from Sacramento River in Sec. 18, T 18 N, R 1 W, for irrigation of 192.7 acres near point of diversion.

Permit No. 2198, Application No. 4325 (Glenn County). Issued to Charles H. Williams, Princeton, California, August 18, 1925, for 0.87 cubic foot per second from Sacramento River in Sec. 18, T 18 N, R 1 W, for irrigation of 34.76 acres near point of diversion.

Permit No. 2199, Application No. 4326 (Glenn County). Issued to Walter G. and C. M. Reichel, Princeton, California, August 18, 1925, for 2.02 cubic feet per second from Sacramento River in Sec. 18, T 18 N, R 1 W, for irrigation of 120.9 acres near point of diversion.

Permit No. 2212, Application No. 4343 (San Diego County). Issued to Mary J. Wood, San Diego, California, August 20, 1925, for 1 cubic foot per second from underground water in Sec. 32, T 12 S, R 1 W, for irrigation of 90 acres near point of diversion. Estimated cost $5000.

Permit No. 2215, Application No. 4301 (Solano County). Issued to E. H. Wheeler, St. Helena, California, August 26, 1925, for 3.34 cubic feet per second from Miner Slough in Sec. 10, T 5 N, R 3 E, for irrigation of 267 acres near point of diversion. Estimated cost $1500.

Permit No. 2216, Application No. 3778 (Los Angeles County). Issued to B. F. Burkhart and Anna M. Burkhart, Littlerock, California, August 26, 1925, for 750 acre feet per annum from Middle Fork of Pallet Creek in Sec. 23, T 4 N, R 10 W, for domestic use and irrigation of 300 acres near point of diversion.

Permit No. 2218, Application No. 4161 (San Joaquin County). Issued to Mary Ives Crocker, San Francisco, California, August 28, 1925, for 3.8 cubic feet per second from Old River in Sec. 30, T 1 S, R 6 E, for irrigation of 305.98 acres near point of diversion. Estimated cost $12,000.

Applications Filed

Among the applications for permit to appropriate water filed with theState Department of Public Works, Division of Water Rights, (California) during the month of August were the following:

Application No. 4719 (Sutter County), Geo. E. Springer, 351 California street, San Francisco, California, for 1.0 cubic foot per second from Sacramento River tributary to Suisun Bay, to be diverted in Section 13, T 15 N, R 1 W, M. D. M. For irrigation on 80 acres. Estimated cost $54,500.00.

Application No. 4720 (San Luis Obispo County), Peterson Farms Company, 527-531 Consolidated Building, Los Angeles, California, for 2½ cubic feet per second and 398 acre feet per annum from Los Osos Creek, tributary to Pacific Ocean, to be diverted in Section 20, T 30 S, R 11 E, M. D. M., for irrigation of 200 acres in Rancho Los Osos. Estimated cost $2500.00.

Application No. 4721 (Orange County), Dana Point Syndicate, care of Charles G. Patrick, 403 S. Hill street, Los Angeles, California, for 30 cubic feet per second from San Juan Creek, tributary to Pacific Ocean, to be diverted in Section 14, T 8 S, R 8 W, S. B. M., for domestic and irrigation purposes at townsite of Dana Point and vicinity. Estimated cost $250,000.00.

Application No. 4730 (Lassen County), Jay C. Wemple, Milford, Lassen County, California, for 2.12 cubic feet per second and 200 acre feet per annum from (a) Mill Creek, (b) Dry Creek, tributary to Honey Lake, to be diverted in (a) and (b) Section 26, T 27 N, R 14 E, and (c) rediversion, Section 23, T 27 N, R 14 E, MDM for irrigation and stockwatering in Sections 23 and 24, T 27 N, R 14 E, M. D. M. Estimated cost $2500.00.

Application No. 4737 (Amador County), Stephen E. Kieffer, Mechanics Institute Building, San Francisco, Cal., for 200 cubic feet per second from Mokelumne River tributary to San Joaquin River, to be diverted in Section 22, T 5 N, R 10 E, M. D. M., for generation of hydro-electric energy. in Section 20, T 5 N, R 10 E, M. D. M.

Application No. 4738 (Colusa County), Martha Wackermann, care of C. D. McCormish, Colusa, California, for .61 cubic feet per second from Sacramento River, tributary to Suisun Bay, to be diverted in Section 26, T 14 N, R 1 E, M. D. M., for irrigation on 48-98 acres in Sections 26 and 27, T 14 N, R 1 E, M. D. M. Estimated cost $2000.00.

Application No. 4741 (Calaveras County), Calaveras Cement Company, 315 Montgomery stret, San Francisco, California, for 1.25 cubic feet per second from San Antone Creek, tributary to South Fork Calaveras River, to be diverted in Section 32, T 4 N, R 12 E, M. D. M. To be used for industrial and agricultural purposes in Section 29, T 4 N, R 12 E, M. D. M. Estimated cost $2000.00.

Application No. 4742 (Calaveras County), Calaveras Cement Company, 315 Montgomery street, San Francisco, California, for 1.25 cubic feet per second from Calaveritas Creek, tributary to South Fork Calaveras River, to be diverted in Section 29, T 4 N, R 12 E, M. D. M. To be used for industrial and agricultural purposes in Section 29, T 4 N, R 12 E, M. D. M. Eestimated cost $2000.00.

Application No. 4743 (Sacramento County), Carmichael Irrigation District, care of Elliot and Atkinson, Mitau Building, Sacramento, California, for 10 cubic feet per second from American River, tributary to Sacramento River to be diverted in Section 22, T 9 N, R 6 E, M. D. M., for irrigation and domestic purposes on 1800 acres. Estimated cost $120,000.

Application No. 4744 (Siskiyou County), William B. McGill & Geo. A. Tebbe, Peters and Dewitt Bldg., Yroka, California, for 1.25 cubic feet per second from Buckhorn Creek, tributary to Klamath River, to be diverted in Section 23, T 47 N, R 10 W, M. D. M., for agricultural purposes on 111.1 acres.

Application No. 4750 (Plumas County), R. B. Swayne and J. N. Turner, care of R. B. Swayne, 201 Sansome street, San Francisco, for 10 cubic feet per second from Jameson Creek, tributary to Middle Fork of Feather River, to ze diverted in Section 25, T 22 N, R 11 E, M. D. M., for generation of hydro-electric energy in Section 7, T 22 N, R 12 E, and Sec. 31, T 23 N, R 12 E, M. D. M. Estimated cost $100,000.

Application No. 4751 (Riverside County), Palm Valley Water Company, care of A. Braunschweiger, 180 Elmwood Court, Riverside, California, for 900 acre feet per annum from Chino Creek, tributary to Whitewater River, to be diverted in Sec. 12, T 4 S, R 3 E, S. B. M., and Sec. 7, T 4 S, R 4 E, S. B. M., for municipal purposes in community of Palm Springs. Estimated cost $2500.

Application No. 4752 (Riverside County), Palm Valley Water Company, care of A. Braunschweiger, 180 Elmwood Court, Riverside, Calif., for 5 cubic feet per second from (1) Falls Creek, (2) Snow Creek, tributary to Whitewater River, to be diverted in (1) and (2) Sec. 33, T 3 S, R 3 E, S. B. M., for municipal purposes in community of Palm Springs. Estimated cost $81,000.

Application No. 4756 (Lake and Napa Counties), C. A. Tusch, 2211 Union street, Berkeley, Calif., for 400 cubic feet per second and 300,000 acre feet per annum from Putah Creek, tributary to Sacramento River, to be diverted in Sec. 29, T 8 N, R 2 W, M. D. M., and Sec. 13, T 11 N, R 6 W, M. D. M. for agricultural purposes.

Power Developments

Twenty applications for permit or license under the Federal water power act were filed with the Federal Power Commission during the seven weeks' period ended August 29, 1925, making a total of 645 applications received to that date. The following applications are those contemplating power developments in the western states:

No. 627—Charles A. Johnson has applied for a preliminary permit for a power project on Salt River, in Gila County, Arizona, about 20 miles north of Globe. A 15-foot diversion dam will be built about a mile west of the mouth of Hess Creek. The project includes a tunnel about seven miles long on the right bank of Salt River, a steel pipe line leading from the tunnel to a power house on the river, and a transmission line about 20 miles long from the power house to the Globe-Miami mining district. The power to be developed is intended for use in mining operations.

No. 629—The California-Oregon Power Company has applied for a license for a transmission line about three miles long, in Klamath County, Oregon.

No. 630—Mrs. Ida M. Butts has applied for a license for a small power plant in Eagle Creek, on the Holy Cross Reservation, in Colorado, from which power will be supplied for use in operating the applicant's mine.

No. 631—Messrs. Kumle and Kassalbaum have applied for a license for a transmission line about four miles long, in Yuba County, California.

No. 632—The municipality of Monroe City has applied for a license for a power project t boe located on Monroe Creek, Sevier County, Utah. The power developed is to be used for municipal purposes.

No. 633—Messrs. Swayne, Leland, and Turner have applied for a preliminary permit for a power project on Jameson Creek, near Johnsville and Blairsden, in Plumas County, California. The development will have four storage reservoirs and appurtenant structure obtaining water from Eureka Lake and Deer, Bear, Squirrel, and Poplar Creeks. The power developed will be used for public-utility purposes.

No. 637—The Chelan Electric Company has applied for a license for a power development in Chelan River, Chelan County, Washington. A dam with apurtenant structures will be built just below the town of Chelan, at the mouth of Chelan Lake. Approximately 50,000 horse-power, primary capacity, is to be developed and will be used for public-utility purposes.

No. 639—The Washington Water Power Company has applied for a license for a transmission line about five miles long in Shoshone County, Idaho.

Upon request of the applicants and of opposing interests in the State of Colorado, the final hearing before the Federal Power Commission upon the application of James B. Girand (project No. 121), for a license for a proposed power development on the Colorado River at Diamond Creek, tentatively set for the early part of September, has been postponed until October 20, 1925,. The hearing will be held at 2:30 p. m. in the office of the Secretary of War, State, War, and Navy Building, Washington, D. C. All objections received prior to October 20, or presented at the hearing will be considered by the Commission in taking action upon this apllication.

OREGON

The following list includes the more important applications as filed in the office of Rhea Luper, State Engineer, of Oregon, for the last month for which records are available:

Walter B. Beebe of Portland, covering the appropriation of water from North Fork of Yamhill River for storage in Westerlock Dam Reservoir, the impounded water is to be used for boating and irrigation purposes in Multnomah County.

B. F. Felger of Dallas, covering the appropriation of water from two unnamed streams for the irrigation of 10 acres and domestic purposes in Lincoln County.

F. A. Garde of Aumsville, covering the appropriation of water from South Beaver Creek for irrigation of 33 acres in Marion County.

F. A. Epling of LaGrande, covering the appropriation of water from springs for irrigation of 20 acres in Union County.

City of Gresham covering the appropriation of water from Heiney Sprnig and seepage from Gulch tributary of Willamette River for municipal supply for city of Gresham, in Multnomah County, at a cost of $15,000.

Charles H. Wikoff of Grants Pass, covering the appropriation of water from Spence Creek for irrigation of 40 acres in Josephine County, at a cost of $2,000.

S. E. McCoy of North Bend, covering the appropriation of water from Haines Inlet for irrigation of 60 acres in Coos County.

M. Tamura of Troutdale, covering the appropriation of water from Beaver Creek for irrigation of 20 acres in Multnomah County.

Cooper Anderson of Salt Lake City, Utah, covering the appropriation of water from an unnamed spring for domestic purposes, including stock water and irrigation of 100 acres in Washington County, Oregon, at a cost of $2,000.

G. F. McCurdy of Nyssa, covering the appropriation of water from Snake River for irrigation of 45.3 acres in Malheur County, at a cost of $1,174.

Harry L. Mills of Hildebrand, covering the appropriation of water from Buck Creek for irrigation of 41 acres in Klamath County.

F. S. McMahon Estate, Freewater, Oregon, covering the appropriation of water from S. E. ¼ N. E. ¼, Sec. 3, T 5 N, R 35 E, W. M., for supplemental irrigation of 10 acres in Umatilla County

Clear Lake Reservoir Company of Halfway, covering the appropriation of water stored in a reservoir on West Fork of Clear Creek for irrigation purposes in Baker County.

A. K. Chapman of Portland, covering the appropriation of water from Sandy River for development of 100 theoretical horsepower, irrigation of 10 acres, and domestic purposes in Multnomah County, at a cost of $1,000.

Thomas Marshall of St. Paul, Minnesota, covering the appropriation of water from two unnamed streams for irrigation of 21 acres in Hood River County, Oregon, at a cost of $200.

C. E. Shurlock of Lakeview, covering the construction of a reservoir for storage of 100 acre feet of water from Crane Creek, and the appropriation of the stored water for irrigation of 100 acres in Lake County, at an estimated cost of $1,000.

J. L. Dillon of Medical Springs, covering the appropriation of water from Dillon Spring for manufacturing and domestic purposes in Union County, at a cost of $1,500.

Tillamook City Water Commission of Tillamook, covering the appropriation of water from North Fork of Wilson River for a municipal water supply for city of Tillamook, at a cost of $150,000.

George Chamberlain of Mosier, covering the appropriation of water from Mosier Creek for irrigation of 7.46 acres in Wasco County, at a cost of $1,200.

M. V. Knight of Joseph, covering the appropriation of water from an unnamed spring creek for irrigation of 55 acres and domestic purposes in Wallowa County, at a cost of $1,000.

Medford Irrigation District of Medford, covering the construction of the Pinnacle Reservoir for storage of 7,500 acre feet of water from South Fork of Little Butte Creek for irrigation purposes in Jackson County, at a cost of $90,000.

New Incorporations

The following new water companies have been incorporated in California during the last month for which official records are available:

No. 115343—MANAKEE MUTUAL WATER CO., (a California company). Directors: J. T. LaBree, Lower Lake; Dr. R. A. Huntington, Lower Lake; Henry Lange, Lower Lake; Henry Grimshaw, Pasadena; E. R. Mullen, Pasadena, (each 1 share). Date of filing, August 18, 1925. Place of business, Lower Lake. Capital stock, $2,000. Par value, $10. Amount subscribed, $50. Purposes—to develop water in Lake County and to distribute it among stockholders at cost who have land reached by pipe lines of this company. Articles filed by E. P. Peers, 1130 Bank of Italy Building, Los Angeles.

No. 115369—RAVENSWOOD CO-OPERATIVE WATER CO. (a California company). Directors: J. H. Stubbe, Pearl R. Stubbe, Loretta M. Self, B. L. Harrison, Geo. Kayes, all of Ravenswood School District, San Mateo Co, Calif. Date of filing, August 20, 1925. Place of business, Ravenswood School District, San Mateo Co. Capital stock, none. Purposes—To furnish water to and irrigate 25.56 acres of land in San Mateo Co., known as Ravenswood School District. Water to be supplied only to owners of this land. Articles filed by Roy R. Waterbury, 418 Hobart Building, San Francisco.

No. 115542—LOMPICO CO-OPERATIVE WATER ASSN., (a California company). Directors: Lloyd Douglas, Menlo Park; Arthur Annis, 833 Market St., San Francisco; E. R. Ellis, 1027 Emerson St., Palo Alto; T. W. von Hacht, 898 Boyce Ave., Palo Alto; G. G. McDaniel, Olympia, Santa Clara Co. Date of filing, Sept. 2, 1925. Place of business, Palo Alto. No capital stock. Membership fee, $20. Purposes—To serve water for domestic and family purposes in Lompico Tracts of land in Santa Cruz County at cost to members of this company. Members are to pay $20 assessment for each lot supplied with water. Articles filed by Norman E. Malcolm, First National Bank Building, Palo Alto.

No. 115641—LAGUNA MUTUAL WATER CO. (a California company). Directors: J. A. Nelson, V. A. Johannsen, Louis Quinby, Wm. M. Smith, May Kennedy, all of Hemet, (each one share). Date of filing, Sept. 12, 1925. Place of business, Hemet, Riverside Co. Capital stock, $10,000. Par value, $20. Amount subscribed, $100. Purposes—to supply water, to its stockholders only, at cost on the following described lands. Lands of Hemet Land Co., according to map of said lands recorded in Book 1 of Maps at page 14, thereof Records of Riverside County, Cal., for domestic and irrigation use. Articles filed by Oliver P. Ensley, Atty, Hemet.

No. 115701—SUNNY SLOPE MUTUAL WATER CO., (a California company). Directors: Geo. H. Ennis, Los Angeles; E. L. Williamson, Riverside; R. C. Gill, Riverside, (each 1 share). Date of filing, Sept. 16, 1925. Place of business, West Riverside. Capital stock, $25,000. Par value, $5. Amount subscribed, $15. Purposes—to furnish and distribute water at cost of stockholders only for domestic and irrigation use, in proportion to number of shares of stock owned by stockholders. Articles filed by Leonard, Surr & Hellyer, Syndicate Building, San Bernardino.

No. 115730—SUNSET MUTUAL WATER CO., (a California company). Directors: C. M. Crawford, C. F. Mohler, C. W. Getchell, all of Los Angeles, (each 1 share). Date of filing, Sept. 18, 1925. Place of business, Los Angeles. Capital stock $10,000. Par value, $2.50. Amount subscribed, $7.50. Purposes—to furnish water to its stockholders within the area of Los Angeles city, described as lots 431 and 442 in Tract 606, recorded in book 15, pages 142 and 143 of Maps of Los Angeles County. Articles filed by Jas. L. Patten, 647 South Spring street, Los Angeles.

Upper Basin States Give Statement of Position

(*Continued from Page 18*)

control works would not be constructed unless the waters controlled are also appropriated and utilized for profit in the production of power and for other purposes. To make claim to waters of the river under such appropriations without first protecting the upper states by an equitable division of the waters as provided in the compact, would menace future development in those states. This must not be. We can not and will not co-operate with the lower basin states until protection is afforded our states by compact between the states interested. To that end, the representatives of our states stand ready to meet the representatives of the lower basin states, together with those of the federal government, to discuss and effect plans whereby flood control and full development of the river may proceed. Therefore, pending and until the approval of the Colorado river compact, considerations of self-preservation compel us to oppose the construction of any works for flood control, power development, or any other uses and we call upon the senators and representatives in Congress of the states of Colorado, Nevada, New Mexico, Utah and Wyoming and the public officials of said states, to use every legitimate means to protect the rights of our states as set forth herein.

"We commend and endorse efforts now in progress to bring about co-operative action by citizens to organize for the common purpose of protecting present and future development in the upper states.

"We earnestly ask the attention of the sub-committee of the committee on irrigation and reclamation of arid lands of the senate of the United States, authorized to proceed during the month of October to make a close and intimate study of the problems of the Colorado river basin, to the point of view of the upper states, as set forth in this address."

"6 years without repairs"~ says one big user of~
KIMBALL
DIRECT FLOW TURBINE
PUMPS

That is one of the many reasons why such a large number of the big users of pumps have adopted the Kimball Direct Flow Turbine Pumps.

Write for descriptive booklet.

Editorial Jottings About Current and Forthcoming Feature Articles, Dealing With Practical Problems of Hydraulics, and the Men Who Have Written Them

MARVIN B. ROUNDS, who has written for this issue an interesting article on irrigation practice in orcharding, became a part of the agricultural extension service only a year ago; but within that short period he has advanced to a unique position—at the head of the extension work for the biggest county, in point of agricultural produce in the United States. He is acting Farm Advisor for Los Angeles County, California.

Agricultural work in Southern California for the past 15 years, mainly with citrus problems, has given Mr. Rounds a thorough training in every aspect of citriculture. He has served as the manager of large ranches, and has been connected with the horticultural department of the county. He was identified for some time with the Bureau of Entomology under R. S. Woglum, who did eminent work in that department and who is now entomologist for the California Fruit Growers' Exchange. For six years Mr. Rounds was manager of the Azusa Foothills Citrus Company's large properties. Irrigation is one of his pet hobbies, and his understanding of soil moisture problems is one of the explanations for his splendid success in horticulture.

WATER USE was the subject of the paper delivered by H. M. Chadwick, Assistant State Engineer of Oregon, before the Oregon Irrigation Congress early in October, and the article under Mr. Chadwick's signature in this issue consists of a few excerpts from that address. Mr. Chadwick is an associate member of the American Society of Civil Engineers, the greater part of whose experience has been in connection with irrigation. He has been connected with irrigation development in New Mexico, Colorado, Wyoming and Montana, in addition to his extensive experience in Oregon. He was employed in Western Colorado as resident engineer on the construction of a mountain canal containing three tunnels and much open channel rock and earth work. This was in the latter part of 1909 and 1910, and was the job which thoroughly initiated him into the irrigation construction game.

Varied experience in locating water rights and making preliminary surveys for projects was gained in the neighborhood of Pueblo, Colorado, following which Mr. Chadwick was connected with the development of the Valier project, in Montana, for several years, serving as assistant chief engineer of operation and maintenance, in responsible charge of all engineering operations. In 1920, he went to Oregon as chief engineer for the Rogue River Valley Canal Company, in charge of the design and construction of the Medford Irrigation District. In 1923 he became assistant state engineer of Oregon, in which position his duties consist of the inspection and supervision of various irrigation construction works coming under the jurisdiction of the state office.

RALPH L. PARSHALL, who describes the improved venturi flume in this number, is senior irrigation engineer of the United States Department of Agriculture, Bureau of Public Roads, Division of Agricultural Engineering at Fort Collins, Colorado. The paper which is reproduced was printed in the Proceedings of the American Society of Civil Engineers, of which Mr. Parshall is an affiliate. Mr. Parshall is one of the workers of the Department of Agriculture who is doing signal service in the advance of the technical side of irrigation, and MODERN IRRIGATION is hoping to have the opportunity to present more articles from his pen in the future.

H. M. CHADWICK
Assistant State Engineer of Oregon

ROBERT A. THOMPSON, consulting engineer, who wrote the article on tht Garza Dam, was born and educated in Texas. He holds bachelor's and master's degrees from the University of Texas, and is a member of the American Society of Civil Engineers. He began his professional career with the Texas Geological Survey; was an instructor at the state university in 1893-94, and with the Texas Railroad Commission in 1895. Between 1895 and 1898, he served as engineer for several important construction projects, and in the latter year became chief engineer for the Railroad Commission of Texas, where he served for ten years. Subsequently he was chief engineer of the Railroad Commission of California, 1911-1913; and from 1913 to 1921 was a member of the engineering board of the Bureau of Valuation of the Interstate Commerce Commission. His record includes outstanding service, also, in the direction of various municipal construction projects. He is a member of the firm of water reservoir engineers of Nagle & Thompson, Dallas, appointed in 1923 to make a report on problems of additional water supply for that city, and in 1924 was placed in charge of the construction of the Garza Dam, which is to provide the needed additional supplies. He recently organized the firm of Thompson & Butler, consulting engineers, in which he is associated with H. G. Butler, former engineer of the California Railroad Commission, and power administrator in California. The office of the new firm is at San Francisco.

IN A RECENT issue we announced that a series of papers dealing with the activities of the Division of Water Rights of the California Department of Public Works was being prepared under the supervision of Edward Hyatt, Jr., chief of the division for publication in MODERN IRRIGATION. The first of these papers will be ready for publication in an early issue. Its subject will be "Water Titles in California", and it will deal with this important subject from such an angle that it will be of interest not merely to the irrigator in California, but to everyone who must deal with titles to water rights.

Another most valuable paper, prepared by an expert, will be ready for an early issue. This is being written by Thomas H. Means, consulting engineer of San Francisco, who some time ago consented to submit an article for readers of MODERN IRRIGATION. "I am working," writes Mr. Means, "on material for an article on a review of the irrigation development which has taken place over the world since the Great War. Some of the largest and most important works ever undertaken have been finished since 1918."

NOVEMBER MODERN IRRIGATION will be a magazine full of helpful material for the irrigationist and the water developer. "Credit for Irrigation Projects—How to Establish and Maintain It" is the title of an article which will appear next month, dealing in a practical and constructive way with some of the financial problems met by irrigation projects. "Permissible Canal Velocities," by Samuel Fortier and Fred Seobey, men whose names are significant in irrigation engineering circles, will be a technical discussion of an important subject to the hydraulic engineer. There will be half a dozen other features, just as interesting.

ONE OF THE interesting irrigation developments going forward in California is the construction of the irrigation system at Vista, San Diego County. Kenneth Q. Volk, the engineer in charge of the construction of this system, is writing a full description of the work for MODERN IRRIGATION.

PETROLEUM WORLD 626 S. SPRING ST., LOS ANGELES, CALIF. MODERN IRRIGATION

ARTHUR P. DAVIS

International authority on hydraulics, who, at the recent Senate Committee hearings on the Colorado River question, which he attended by special invitation of the senators, held the background as perhaps the foremost technical advisor upon the engineering features of the problem. Through long experience in hydro-engineering affairs, including ten years as director of the Reclamation Service and first-hand contacts with reclamation enterprises in many parts of the world, he assumes a place of prominence in any irrigation gathering at which he appears.

The Progress *of* Irrigation

WHETHER the problem of the Colorado River is nearer solution as the result of developments during October no one knows. Members of the senate committee—a sub-committee of the Committee on Irrigation and Reclamation —that met late in the month at Los Angeles, and continued their hearings in Southern California, Arizona and Nevada into the early part of November, have at least acquired a great deal of information about the various aspects of the different schemes proposed for the development of the river, and will go into the new Congress in December able to make intelligent recommendations. Public interest has undoubtedly been stirred to a greater extent than ever before, also, as the result of those hearings; and the publicity given them can hardly help being of influence toward an early settlement, of some kind, of the question which almost every one agrees is pressing for a conclusion most imperatively.

The unfortunate thing, however, is the fact that many people suspect that members of a senatorial committee do not always recommend action in strictest accordance with their investigations and findings, but have the habit of continuing to hold to the notions which were theirs prior to the investigations, based on their pet political philosophies or their particular personal connections.

AND EVEN when the committee has made its report, the Congress will not necessarily enact legislation which it recommends. Only a small proportion of the senate membership have seen for themselves what the Colorado is, and have heard from many sources what it means to the southwest. It is quite conceivable that others may let the eastern prejudice against further reclamation development, and a lack of interest in the whole subject, defeat whatever action may be championed by the committee.

There is, therefore, small ground for an optimistic belief that the Colorado question has been finally answered or that it is on the point of settlement. Those who are interested in seeing it answered must continue to work unremittingly to that end. Congress naturally will be hesitant about making an arbitrary decision in the matter when there is no apparent agreement between those most directly concerned. The several states whose inter-

ests are involved must find some common ground on which they can agree.

ADDITIONAL emphasis is given to this assertion by the decision of the Federal Power Commission, announced late in the month, to suspend action on all applications for power permits contemplating developments on the Colorado and its tributaries, "for a reasonable time," and urging that the interested states reach an agreement which will make possible such development in the future without the danger of interference on interstate grounds.

The special issue before the Commission when it announced this policy was the Girand application, seeking a permit for the construction of works for power development at Diamond Creek, but by the policy enunciated by the Commission, *all* pending applications are laid aside for an indefinite period—"a reasonable time," in the phraseology of the decision.

The Girand decision, on the face of it, brings the Colorado question to a focus. Too many years have been permitted to elapse in fruitless buckering between the states, and notice has now been served that if the states can not soon get their minds into substantial agreement on some policy that will afford protection to all interests, the Federal Power Commission will be obliged to say: "There seems no chance of a concerted and constructive policy; let the development so urgently needed begin under private and corporate auspices. Better a policy that will not suit everyone than no policy at all."

THE REPORT of E. C. La Rue on the Colorado River, issued during October by the U. S. Geological Survey, received a warm, if not cordial, reception. Mr. La Rue has spent fifteen years getting acquainted with the river, and should know something about it; but his report and the plan which he has advanced for the development of the resources of the river have already become the target of a merciless attack of criticism from many sources. One of the chief critics has been William Mulholland, chief engineer of the Los Angeles Water Department, who, reinforced by his chief assistant, H. A. Van Norman, attacked the "La Rue plan" without reserve before the senate committee. Mr. La Rue, in turn, has objected to Mr. Mulholland's attitude on the ground that the Los Angeles engineer is not familiar with the problems of the Colorado, nor qualified to criticize a report prepared by one who has spent a decade and a half in its study.

Mr. La Rue's report presents an ambitious scheme for the development of the river below the mouth of Green River, with particular reference to flood control and the development of power. An adequate plan for the development of the river, in his opinion, would involve the construction of thirteen dams at various points on the river, and he proposes a gravity system for bringing water to Southern California for domestic use. His critics regard the plan as visionary and impractical from both an engineering and a financial standpoint.

IRRIGATION'S progress is not alone achieved by the building of dams, the laying of pipes and the growing of crops. It proceeds on all fronts simultaneously, and its advance in one sector must be met by similar victories in the others. In the courts of the land, and the various tribunals created for the consideration of its problems, it must fight its battles—battles which are as important, perhaps, as any that are fought out in legislatures, or before boards of directors, or by engineering staffs.

A case of great importance to irrigation is now pending before the Supreme Court of California which may be considered, perhaps, one of the critical skirmishes in the march of irrigation. The cause at issue is that of Herminghaus *vs.* the Southern California Edison Company, a piece of litigation which involves the whole broad foundation of the theory of riparian rights.

In the decision of the trial court, from which an appeal has been taken—now pending before the Supreme Court—it was found that the riparian owner of lands could prevent the storage of winter flood water either by appropriators or riparian owners if such storage interfered with any use of the water by the lower riparian owners. By this conclusion the plaintiff, Mrs. Herminghaus, was held to be within her rights in attempting to prevent the Southern California Edison Company from impounding waters of the San Joaquin River on the ground that the river customarily overflows its banks in the winter time, producing pasturage and enriching the lands of the riparian owners by the deposit of sediment.

The Irrigation Districts Association has considered this pending litigation of enough importance to instruct its attorneys to file a brief in the case and to appear at the hearing of the appeal as *amici curiae*.

Those interested in the broader aspects of irrigation will look forward with real interest to the outcome. The contention of the defendants and of the irrigation interests is that the time has come for the old conception of riparian rights to undergo some modifications; a theory of reasonable use seems called for. The traditional law on the subject grew up under circumstances vastly different, and is based upon considerations far removed, from those which should control water development under present conditions.

Members of the Senate committee conducting hearings on Colorado River problems as they appeared in their session in Los Angeles. From left to right: Senators Hiram W. Johnson, Samuel M. Shortridge, California; Tasker L. Oddie, Nevada; Lawrence C. Phipps, Colorado; Charles L. McNary (chairman), Oregon; John B. Kendrick, Wyoming; Key Pittman, Nevada; C. C. Dill, Washington, and Henry F. Ashurst, Arizona.

Members of Senate Committee on Irrigation Hear Pros and Cons of Colorado Problem

By DOUGLAS G. McPHEE

CITIZENS of the southwest, during October, had impressed upon their collective consciousness the fact that around the fundamental question of water revolves the whole future of the great southwestern empire. Irrigation held the spotlight of attention in the forum and the press. Members of the United States Senate Committee on Reclamation and Irrigation, headed by its chairman, Senator Charles L. McNary, of Oregon, meeting at Los Angeles, summoned before them a succession of witnesses who presented probably the most comprehensive discussion of various aspects of the problem of the development of the Colorado River ever given before such a tribunal.

The two days' hearings in Los Angeles on October 26 and 27 served as the beginning of an intensive study which the Senate committee will not conclude until November 12, when it visits the site of the proposed Boulder Dam on the Colorado River. Hearings in San Diego, a visit to many of the cities of the Imperial Valley, an inspection of various points involved in proposed plans of developing the river, an inspection of the Yuma project, and sessions in several cities of Arizona were included in the committee's itinerary.

The hearings in Los Angeles were notable gatherings in the name of irrigation and hydro-electric development, not only because of the senators who surrounded the long table, but because of the character of many of the witnesses and the assemblage that "listened in" on the testimony. The list of witnesses included the names of many eminent irrigationists, both technical men whose testimony bristled with concrete engineering data, and non-technical men, whose interest in the river problem was expressed in terms of the constantly growing section of the country so largely dependent on this resource.

Another type of man was well represented also—the politician—men whose concern in the Colorado River question is predicated upon the reaction of their constituents to their expressed attitude. They were there in force, each with an ear to the ground and the other cocked acutely in the direction of the amplifier from which the testimony of witnesses was reproduced in stentorian tones.

HOLDING the center of interest, of course, was the senatorial committee. At one end sat Hiram Johnson, California's senior senator, polished of diction, aristocratic of appearance, softly modulated of voice. It was Johnson the advocate, rather than Johnson the judge, however, for he is the legislative father, in the Senate, of the Swing-Johnson bill, to which most of the time was devoted in the Los Angeles sessions. It was Johnson who "programmed" the speakers in behalf of the measure, especially of its characteristic feature, the All-American Canal; it was Johnson whose gentle voice elicited for the record the qualifying facts to establish the authority of the witness; it was Johnson who frequently brought out, with a few pointed questions at the end of the testimony, an essential fact or two that the witness had neglected.

Next to him sat Samuel Shortridge, his colleague in the senate, but not always his supporter in issues of legislation. Shortridge is an orator by instinct and profession, but during the hearings his oratory was repressed. A long bony fore-finger, shaken in the direction of the witness or a map or a diagram, constituted the major part of his contribution to the sessions as he requested that this point on the map be identified or that point in testimony be more clearly explained. Shortridge is one of the senators who was closely watched during the hearings, for until the present time he has not made his position on the Swing-Johnson bill particularly clear, while his rivals in the forthcoming senatorial race are raising the issue against him. Both factions are listening intently for a definite statement of his position on the measure.

Senator Tasker L. Oddie, of Nevada, sat on Senator Shortridge's left. He was flanked, on the other side, by Lawrence C. Phipps, of Colorado. Neither of these said much—perhaps they thought a great deal. The rotund countenance of Senator Oddie and the florid one of Senator Phipps expressed little except ennui during most of the hearing. The latter consumed an infinite number of cigars.

IN THE CENTRAL location at the table was Senator McNary, of Oregon, chairman of the committee. Senator McNary takes his position seriously. He was always in his seat, always following the testimony closely. He looked tired, and doubtless was tired. His position as chairman was not an enviable one, for it was a continual struggle against time and against verbose witnesses who felt that their particular messages were important enough to warrant taking just a few minutes over their alloted periods.

John B. Kendrick, of Wyoming, was on McNary's left, and next to him sat Key Pittman of Nevada. Neither spoke

often, but Pittman, when he spoke, committed himself clearly to the belief that the Swing-Johnson bill in its entirety is extremely doubtful of passage, and that the thing which could be done and ought to be done is to submit a bill for flood protection only to the next congress. "Such a measure would be passed by the Congress," he declared, "and it would then be for the government to decide what kind of a dam should be erected in order to return the expense of construction." There was some applause for this declaration, but it was discounted by others who have counted Pittman as the foe of the essential idea behind the Swing-Johnson bill.

Senator C. C. Dill, of Washington, and the suave Henry F. Ashurst, of Arizona, completed the committee at the Los Angeles sessions. Senator Ashurst sat on the other side of the table from Senator Johnson and it was apparent that he was on the other side of the question under discussion, as well. Senator Ashurst spoke occasionally, at one time rising to ask permission of the chair to introduce three representatives of his state for testimony. He thanked every one at the table; he thanked the chairman for the time, the committee for listening, the witnesses for appearing. It was a beautiful example of "senatorial courtesy."

AROUND the outskirts of the senate committee was a fringe of other notables. Congressman Phil D. Swing was much in evidence, sitting close to Senator Johnson and often conferring with him. Swing is the father of the Swing-Johnson bill in the House of Representatives.

Another congressman, John D. Fredericks, spent some time around the hearings. He was the author of the Fredericks bill, introduced before the last Congress as a substitute measure for the Swing-Johnson measure and favored by some interests in opposition to the latter.

Joe Crail, candidate for Congress to succeed Fredericks, was also in attendance at the hearings. Mayor John L. Bacon of San Diego, Mayor George E. Cryer of Los Angeles, William Gibbs McAdoo, himself both an engineer and a politician of no mean parts; Robert M. Clarke, champion of the Swing-Johnson bill and candidate for the senate to succeed Shortridge—all these were present and accounted for.

Irrigation had its representatives there, also, as well as politics. Behind the senatorial table sat Arthur P. Davis, former director of the national Reclamation Service, and now chief engineer and general manager of the East Bay Municipal Utility District of Oakland, California. He was there in quasi-official capacity, called at the request of the senators as an acknowledged authority to give testimony on technical questions when needed. With him was F. E. Weymouth, also formerly of the Reclamation Service.

Scattered about the room among the audience were other notable irrigation figures. Professor Frank Adams, of the University of California, was there with a number of his colleagues from the Department of Agriculture. Several of Los Angeles' eminent irrigation engineers dropped in for an hour or two during the hearings. "Big Bill" Mulholland, chief engineer of the Los Angeles Water Department, and his chief assistant, H. A. Van Norman, were there, and later testified before the committee, as did F. A. Reid, president of the Salt River Valley Water Users' Association, and several officials of the Imperial Irrigation District.

The Swing-Johnson bill, and especially the All-American Canal, received most of the attention of the committee in Los Angeles, the proponents of the measure having an opportunity, because this is the measure concretely before Congress, to make the most exhaustive showing in favor of the bill that has ever been afforded. When the Los Angeles hearings were over, and the committee on its way south, where the river was to be studied in its own habitat, there was no official statement given out, but it was apparent that there was a strong division of sentiment among the members. Senator McNary was believed to be favorable to a recommendation of the Swing-Johnson bill to Congress, and was quoted by the press as saying: "In my opinion a favorable report will be made to Congress in regard to the Colorado River dam. . . . Swing and Johnson have proposed certain legislation . . . the committee will probably adopt some of the proposals." Such a qualified statement, of course, means approximately nothing.

Federal Power Commission Suspends Action on Colorado River Permits

ACTION on all applications for power licenses on the Colorado River and its tributaries now pending before this commission, and not finally acted upon, including the Girand application, is hereby suspended for a reasonable time.

"Constructive governmental policy requires that the states affected should, and they are hereby urged to reach, as speedily as possible, an agreement among themselves for the division of the waters of the river system, all to the end that thereupon developments may proceed unchallenged upon interstate grounds."

Such was the important and far-reaching decision of the Federal Power Commission, late in October, after consideration had been given to the application of J. B. Girand, former state engineer of Arizona, and associates, who sought a permit to develop power at the Diamond Creek site on the Colorado River in Arizona.

The Commission's decision not only suspends action on the Girand application, but holds up more than a dozen other applications for power permits contemplating developments at various points on the Colorado River. It does more than this, however, for it enunciates a policy to be followed in the future "for a reasonable time"—a policy that urges that an agreement should be reached by the Colorado River States before a program of development is authorized.

The decision on the Girand application followed a hearing at which several state governors and members of congress representing the seven states interested in the Colorado River question were heard by the Federal Power Commission, most of them opposing the application and asking for a postponement of action. The basis of the opposition was that any reservoir erected at present in the river system might affect the water rights of each of the states, although the states involved have not yet been able to reach a mutually satisfactory conclusion in the negotiations among themselves for the settlement of their respective rights.

A variant interpretation has been put upon the phrase "a reasonable time" upon which the Commission has apparently laid stress in reaching the decision quoted. Some observers believe that the Commission emphasizes that it is witholding action for a reasonable time only as an indication that it will be obliged, should the *impasse* between the states continue without indication of a settlement being possible, to consider the various applications now pending before it, each on its own merits, and to grant such applications after the "reasonable time" has elapsed.

Other observers see in the phrase an indication that the Commission is expecting some definite and constructive action to be taken by the forthcoming congress that will provide a basis for the future development of the river and its tributaries.

This Project Involves Some Interesting Problems in Irrigation Construction

A Conduit Was Built Over Twelve Miles of Rough and Rugged Country, and a Flume "Shot From Guns"

By KENNETH Q. VOLK
Chief Engineer, Vista Irrigation District

THE VISTA Irrigation District embraces 17,500 acres of beautiful rolling lands in Northern San Diego County, located midway between the towns of Oceanside and Escondido and about 100 miles south of Los Angeles.

The water supply for the district is derived from Lake Henshaw, having a storage capacity of 164,000 acre feet and a drainage area of 210 square miles of high mountain area. Lake Henshaw is the property of the San Diego County Water Company, from which company the district purchases its water supply. The water from the Henshaw Reservoir is allowed to flow down the San Luis Rey River to the intake of the Escondido Mutual Water Company's canal, from which point it is transported through that company's concrete lined canal to Lake Wohlford. The delivery point for the district's water is at the tail race of the power house to be constructed by the San Diego County Water Company below Lake Wohlford and five miles north of the town of Escondido. From this point the water is transported through a conduit constructed by the Vista Irrigation District.

This conduit has a total length of 12.8 miles and a capacity of 44 second feet and is constructed through a rough and rugged side hill country. The conduit consists of 2,000 feet of tunnels, 7,300 feet of 42 inch gravity concrete pipe and 4,600 feet of 42 inch reinforced concrete pipe, 19,000 feet of 36 inch and 40 inch riveted steel siphons, and 35,000 feet of Gunite bench flume.

ONE of the most interesting parts of this project from an engineering standpoint is the construction of the "Gunite" bench flume. The dimensions of the flume are 3 feet and 4 inches in depth by 4 feet, 3 inches in width. The side walls are only 2 inches in thickness and the bottom 2½ inches. Reinforcing of the side walls consists of 4x4 No. 6 x No. 6 electrically welded galvanized mesh. The side walls are reinforced by bending the mesh through ½ inch square bars and the bottom of the conduit is reinforced by 5 x 9 x No. 12 x No. 12 electrically welded galvanized wire. The top rails of the flume are held together by a precast concrete bar 2 inches square containing a ¾ inch steel rod placed at eight-foot intervals along the flume.

Laying a 42-inch reinforced concrete siphon over a precipitous incline.

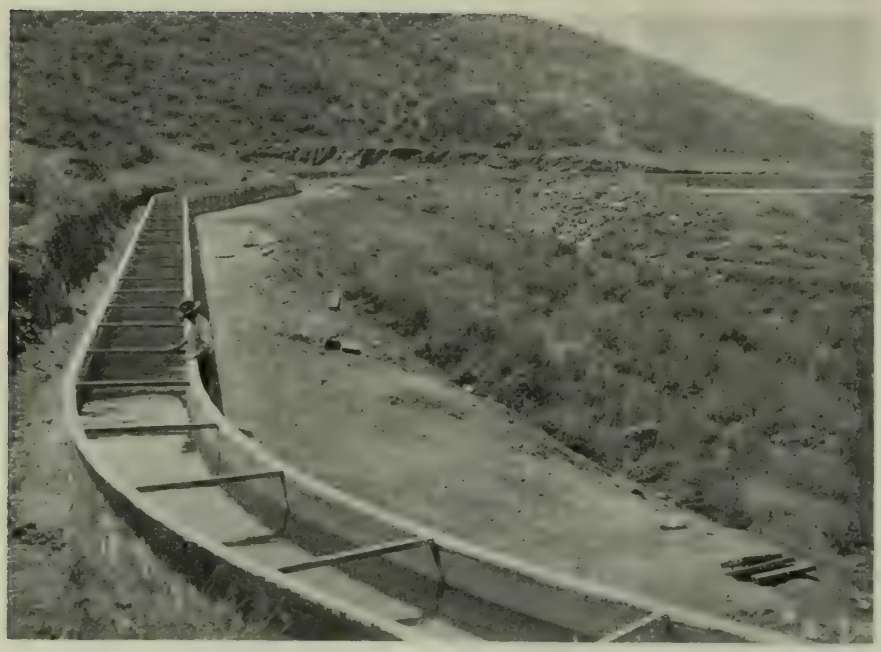
This type of construction was adopted after a careful study as being peculiarly fitted to the steep and rocky character of the side hills on which the flume was to be built. The method of construction consists of the excavation of a roadway to proper grade, width and location, on which the "Gunite" bench flume is constructed. After the roadway is roughly graded, the materials for constructing the flume are hauled by truck and deposited on the outside of the roadway. After all materials have been hauled, the subgrade is thoroughly wet and tamped to avoid settling.

Next, the forms for constructing the flume are set to proper alignment and grade by crews of form setters. Light wooden forms were used for constructing the flume so that curves could be readily made by bending the forms rather than having special curves for all bends. Standard curves of 50, 100 and 200 foot radius were used on the location of the conduit. These light forms allowed the carpenters to set them continuously regardless of the radius of curvature.

MESH for reinforcing the bottom was laid on the finished subgrade and the forms set thereon, after which the reinforcing crews placed the reinforcement for the side walls and rail, rigidly securing them in position. The placing of the reinforcing requires considerable care as the thickness of the walls is only 2 inches.

The compressors used in connection with the Gunite work were 6 x 8 pneumatic compressors mounted on caterpillar tractors. The guns used were N2 Guns made by the Cement Gun Company, Inc. The materials used in constructing the flume consisted of one part of cement to four and one-half parts of coarse sand. All sand for the construction of the flume was hauled from Escondido Creek and screened just prior to its use. Measured quantities of sand and cement were mixed in a small concrete mixer and them dumped on to a platform and shoveled into the gun. Seldom was more than 100 feet of material hose used in shooting the flume.

The side walls and fillets at the junction of the floor and side walls, together with part of the rail, were shot first. After approximately a fifteen minute interval, the balance of the rail was completed by shooting on an additional layer. Shooting the bottom of the flume was carried on in such a manner that seldom was there more than 100 feet of side walls constructed ahead of the floor. The light wooden forms were



When the bench flume was done. The completed flume, carrying water. Notice the many curves made necessary by the irregular topography.

first held in place above the floor by resting on temporary bracing which was removed as the floor was constructed. Approximately 1,000 feet of forms were needed with each Gunite crew. The forms were generally stripped 48 hours after construction of the flume. Frequently, however, forms were stripped within 24 hours and the flume filled with water so as to receive its maximum stress within this period of time.

CONSTRUCTION work on the bench flume was started at points where water could be secured for construction and for curing of the flume. Small wooden dams were placed in the flume approximately at the end of each day's run and water pumped in until the dams were filled.

The advantages of this type of structure are:

1. Economy of construction is effected, particularly in a rugged and rocky country.
2. Side hill drainage water is eliminated, which is extremely advantageous where water is used for domestic purposes.
3. It is difficult for animals to get into flume.
4. Fencing is not required.
5. Smaller sections can be used on account of smooth interior finish left by shooting against the form.

The flume is constructed as a monolithic structure and has no expansion joints. Two gunite crews were employed on this work, each crew consisting of approximately 28 men. The daily progress varied from 150 to 200 linear feet.

The main conduit terminates at the distribution reservoir having approximately 250 acre-feet capacity. Several laterals are taken off the main conduit before it reaches this point. However, the greater portion of the district's water passes through this reservoir.

The distribution system is constructed entirely of steel and concrete pipe; the concrete pipe ranging from 8 to 36 inches in diameter, and the riveted steel pipe from 4 to 18 inches in diameter. All pipe lines were laid with sufficient cover to allow for cultivation of the soil. All steel pipe is double dipped and wrapped with a protective coating to prolong the life of the pipe. The concrete pipe used in the distribution system is constructed under a very rigid specification. Both steel and concrete pipe lines are guaranteed against leakage and breaks for a period of one year after installation.

OWING to the rolling nature of the lands in the District, numerous steel siphons are necessary for transporting the water from one ridge to another. The main distribution line of the district follows along the foothills at a high elevation, the main laterals taking off the same at proper intervals and carrying the water to various points of the district. Six circular concrete regulating reservoirs are provided for controlling the flow to various laterals. The system has been designed so as to provide for both irrigation and domestic water.

Primary distribution to units of 40 acres has been provided in the initial construction. Since the territory served by this system is destined to be subdivided into small acreages and intensively developed, due to the favorable climatic conditions, further extensions of water delivery will be made progressively as development and settlement demand.

The design and construction of the entire system has been supervised by J. B. Lippincott, Consulting Engineer for the district.

Splendid progress has been made on the construction work of the Gunite bench flume and on the distribution system. It is anticipated at this time that water will be turned into the line by February 1st, 1926. The rapid progress of construction can be attributed to the splendid support received from the Board of Directors and the people of the district.

How the bench flume was shot from guns. The cement gun "shooting on" the walls of the flume. Note the 4x4 electrically welded mesh reinforcing of the sides.

A DESOLATE OUTLOOK
These lands, once cultivated, have been rendered unproductive by alkali accumulation.

Protecting Our Irrigated Lands From Seepage and Alkali

By D. W. MURPHY
Consulting Engineer

ONE of the problems which must be recognized and cared for, in practically every irrigated area, is that of protecting the soils from becoming water logged and alkaline. It is a common experience that irrigated soils deteriorate through alkali accumulations in them. The question may be asked, Why should soils, once fertile, and free from harmful quantities of injurious salts, become useless through their accumulations? The answer to this question lies in the fact that soils of arid and semi-arid regions are seldom if ever free from alkali.

In the formation of soils the rocks from which they are formed are disintegrated through the action of various natural agencies. Under arid conditions the mineral salts which are set free in the process of disintegration are not so completely leached out of the resultant soils as is the case in the humid areas. This is due to lack of rainfall to complete the leaching process. These mineral salts generally are beneficial and many of them are necessary to plant growth. Some of them, however, especially in excess quantities in the soil, will prevent the growth of practically all forms of useful plants.

IN THE PROCESS of soil formation the mineral salts are distributed, more or less uniformly, throughout the soil mass. In this condition the content of harmful salts generally is not large enough to render the soils unfit for cultivation or growing crops. When, however, they become concentrated in a particular locality, or, as is commonly the case in irrigated areas, in the surface layer of the soil, the content of harmful salts may become so great as to prevent plant growth.

The most common agency which causes concentration of alkali and other salts in the soil is water. Through the action of water, applied in irrigation, the salts which originally were more or less uniformly distributed in the soil may be brought to the surface.

The application of excess quantities of water and the lack of proper drainage are the principal causes of the rise of alkali in soils. The salts are dissolved by the water in the soil and carried upward in solution by capillary action. When the water is evaporated the salts are left on or near the surface. It may be assumed that a larger part at least, of the soils of the arid region contain sufficient harmful alkali salts to render them unfit for growing crops, should these salts be concentrated at the surface.

Conditions which are favorable to bringing up and depositing mineral salts are, first: free ground water at relatively shallow depth; and, second: free evaporation from the surface of the soil. The first of these may be brought about by excess application of water. The second is a provision of nature that wherever moist or wet soil is exposed to the action of sun and atmosphere, evaporation will occur. The rate of evaporation depends upon the temperature of the atmosphere and the amount of moisture which it contains. In the arid sections, especially the southwestern United States, high temperatures and dry atmospheres ordinarily prevail. The rate of evaporation consequently is high.

When free ground water rises near to the surface, the soils also become nonproductive, due to excess water in them. Useful plants, with but few exceptions, will not live with their roots in free water, nor in a soil the pore spaces of which are filled with water.

TO MAINTAIN the irrigability and productiveness of soils they must be protected from excess accumulations of ground water. In other words, the zone of saturation or free water table must be kept well below the surface of the soil. To give this protection requires, first: careful application of water in irrigation; and second: that soils have adequate drainage. Where nature has not provided underground drainage sufficient to carry away the excess water which finds its way into the soil, this should be provided by artificial means.

It is a difficult problem to determine the amount of water that should be applied in irrigation. This amount should be sufficient to insure the best results in growing crops, without, at the same time, doing injury to soils through the application of excess. There is involved, also, the question of how this water shall be applied in order to reduce underground waste to a minimum. It should be remembered that water which sinks below the zone of plant growth is lost so far as being of benefit to growing plants. It may also become a menace to soils by raising the water table to a dangerous height.

(Continued on Page 40)

W. L. POWERS

Newly elected secretary of the Oregon Reclamation Congress, and Secretary, since 1915, of the Oregon State Drainage Association

Oregon Maps Out Constructive Program of Development

Reclamation Interests are all United in Effort to Increase State's Agricultural Wealth and Double Area of Productive Lands

By W. L. POWERS

AT THE ANNUAL meeting of the Oregon Congress at Grant's Pass, October 5-7, the name of the Congress was changed to Oregon Reclamation Congress, and the scope of the work was broadened to the end that drainage districts and logged-off land districts also can be part of the organization. The Oregon State Drainage Association will meet at Salem about the first of December, at which time the Association will have an opportunity to affiliate with the Reclamation Congress.

The new constitution of the Reclamation Congress calls for five trustees from each congressional district, or fifteen trustees in all. The new President, Wilford Allen, of Grant's Pass, has been an active official in the old Oregon Irrigation Congress for several years. The new Secretary has served as Secretary of the State Drainage Association the past ten years; hence all reclamation interests are united in the new organization, the Oregon Reclamation Congress, which will have for its purpose the general good and advancement of reclamation throughout the State.

The Oregon Reclamation Congress is devoting its efforts to the development, as feasible, of the arid and wet lands of the State whereby the productive area of improved farm land in Oregon can be doubled, the balance of rural population maintained, the wealth producing and assessed valuation greatly enlarged, and the different regions of the State consolidated.

The Oregon Irrigation Congress has held fifteen regular annual sessions, with a steady gain in strength and accomplishments. It has been instrumental in educating the people as to the need and value of irrigation, and has secured a modern irrigation district law, under which some sixty-five projects have developed, embracing a million and a third acres, of which over one-third of a million acres have been actually reclaimed. During the period of 1909 to 1919 the irrigated acreage in Oregon increased 43.2 per cent. The acreage these enterprises were capable of irrigating increased 57.6 per cent. Just now the need is for closer settlement and improvement of land for which water has been provided.

GOVERNMENT reports show that the increase in irrigated land accounts for one one-third of 1% of the gain in improved farm land during the past decade, and, further, that the increase in population is more rapid than the increase in food production. Looking to the future, there is need of developing our arid soil and water resources by irrigation to the utmost. We should plan our reclamation programs for a decade ahead if we are to continue to be self-supporting and produce our own foodstuffs. Thirty-six hundred families would fill up all the partly developed irrigation projects in Oregon. The quality of the soil and the water supply in these projects has been passed on by State authorities, a plan of colonization is being developed, and good progress is being made in settling up several of these newer projects.

Three new Federal reclamation projects have been designated in Oregon and appropriations made therefor. In the past Oregon has paid into the Federal Reclamation Fund approximately $12,000,000 and has received back on Oregon projects about $6,000,000. In addition, there will be derived from the sale of government timber within Oregon approximately $300,000,000, 65 per cent of which will revert to the Federal Government. The terms of the new reclamation law will make the annual cost of land and water on these new Government projects very reasonable and should insure settlement.

The Oregon State Drainage Association was organized in the year 1915. It was aimed to combine the agencies interested in drainage, accumulate data, disseminate information, secure needed legislation, and by other legitimate means further development, as feasible, of the 3,000,000 acres of wet lands in the State. The association has held ten annual conferences and five summer field tours, and has enjoyed a steady growth. Four biennial reports have been published that form a record of accomplishments from the date of organization. Through the Association's efforts a modern drainage district law was secured and perfected. Some sixty districts have been organized, which have drained and improved a quarter million acres of now very productive land. The association has assisted in securing rural credit legislation and various measures looking to the welfare of settlers on reclamation projects.

The Oregon Reclamation Congress has important work ahead in connection with the development of the great fundamental soil and water resources of the State, and a comprehensive program of consistent development must be carried out as a matter of public policy.

RESOLUTIONS passed at the recent annual meeting provided:

"That it be urged and demanded that properly constituted authorities of the Federal Government go forward with projects in Oregon for which Congress has made appropriations;

"That the attention of the Eastern and Mid-Western communities, through their publications, be called to the fact that the Reclamation Fund is created by no draft or tax on them, but is constituted exclusively from the sale of public lands, and the revenues of oil leases from the eleven Western States, and is a Western fund;

"That it be made clear that settlers upon government projects must meet their obligations when it is known that they are able to pay the charges assessed against their land;

"That the legislature of the State provide for topographic mapping of those

Electricity is the *Power Behind the Pump* in Modern Irrigation Developments

The Las Posas Valley is Undergoing a Great Transition Under the Influence of Water

By F. E. ANDERSON *

A STUDY *in contrast between the old and the new in water development in the Las Posas Valley.* UPPER LEFT—*A symbol of the vanished era. This windmill was installed in 1892.* RIGHT—*The switchboard at the main plant of Zone No. 1 Mutual Water Company, Somis, California.* LEFT—*Interior view of main pumping plant.*

NOTABLE transitions are taking place in Ventura County, in Southern California, both *in* irrigation and *because of* irrigation. Ventura County—especially the fertile Las Posas Valley, located in its southern half—has long been famous for its production of lima beans, growing what its boosters assert to be more and better and bigger beans than any other section of the world. Today, with increasing supplies of water, large districts in this county are being planted to orchard crops, which the richness of the soil and the ideal climatic conditions make even more profitable than the famous beans.

In irrigation itself, equally significant changes are evident. Occasionally, throughout the valley, the observer may see the windmills of a vanished era, whose puny efforts in days gone by brought a feeble flow of water out of the earth. Today the power behind irrigation is largely electricity—functioning through the most modern and complete motors and pumps, and controlled by complicated switchboards which the irrigators of a decade past could hardly have imagined—much less understood. Delicate electrical devices, the product of the new electrical age, are lending their assistance to the effort to join water and power in a partnership that will give an adequate supply of water to allow the maximum utilization of the wealth dormant in the soil.

POSSIBLY the greatest factor leading to these new developments in the Los Posas Valley has been the work of the Zone Water Companies. The organization of these companies dates back to 1919, when the stockholders of the Las Posas Water Company engaged an engineer to make the necessary studies to determine whether an irrigation system would be feasible.

The first well was drilled in the latter part of 1920, and it was followed successively by five additional wells, two of which have been recently completed. On these latest wells the pumps and motors are now being installed.

The source of water upon which the companies depend is the Las Posas Creek, located near Somis, in the same county. An area of approximately 172 acres is included in the source of the supply. The average depth of the wells in this water-bearing stratum is 650 feet, and the average draw-down 65 feet. The total flow of all wells at the present time is 850 M. I.; while it is expected that the ultimate development will amount to 1000 M. I.

ZONE "No. 1" covers the lower area of land, and Zone "No. 2" the higher levels. These two zones comprise an area of 4291 acres, which is served by 23 miles of concrete pipe of all sizes,

The Design and Construction of Concrete-Lined Distributing Reservoirs

Some Interesting Data on Distribution Reservoirs in General and the Stanford Heights Structure in Particular

By I. E. FLAA

DISTRIBUTING reservoirs are used for receiving water from long conduits, leading from the source of supply into the cities which they serve, and there regulating the flow into the distributing system. This regulation of flow is necessary due to variation of consumption during a 24-hour period, the maximum consumption for a short period being greater than the carrying capacity of the conduit, and also to give a continuous supply to the district during the period of shut-down on the conduit due to accident or other causes.

Distributing reservoirs are also used for regulating the flow and pressure in pumping systems.

The capacity and location of distributing reservoirs depend upon the requirements of the district to be served. The type depends upon the physical character of the available sites.

Among the important types are the: (1) Excavation and rolled embankment in earth with the necessary impervious lining; (2) Concrete, steel and wood tanks; and (3) Standpipes.

IN A DISTRIBUTING system it is desirable to maintain a pressure between 40 and 50 pounds at the tap; thus it will be seen that in any city having a wide range of elevation, in order to maintain the pressure of 40 to 50 pounds, the area must be divided in zones between every 100-foot rise in elevation, thus requiring some regulating device for each zone or pressure district; while a flat city will require only one regulating reservoir or possibly two.

In San Francisco, with elevations varying from sea level to nearly 1000 feet above sea level, seven distributing reservoirs and fourteen tanks are rerequired at the present time properly to regulate the flow in the nineteen major pressure districts into which the city is divided.

The East Bay Cities of Oakland, Alameda, Berkeley, Hayward and Richmond, with towns and communities in between, served by the East Bay Water Company, with a variation in elevation from sea level to 1400 feet above sea level, require twenty-five reservoirs and seventeen tanks.

In Sacramento, which is flat, only one reservoir is used and that is in conjunction with the present filtration plant. In San Jose, another flat city, one reservoir.

EXCAVATION and rolled embankment reservoirs require a detailed study in every case, first because the location is limited to a predetermined elevation, there being only a relatively small number of available sites at the particular elevation required in the proximity of the district to be served, and a study must be made to determine which one lends itself to the most economic construction.

THE accompanying article is taken from a paper presented by the author to the California Section of the American Water Works Association, at its Sixth Annual Convention, at Santa Cruz, in October. Mr. Flaa is chief draughtsman for the Spring Valley Water Company, of San Francisco, and his paper dealt with construction work on three concrete-lined distributing reservoirs by that Company—the Stanford Heights reservoir, the Niles Reservoir, and the University Mound Reservoir, which was recently raised six feet above the limits of the old embankment originally built in 1880. The first of these construction jobs only is described in this excerpt from Mr. Flaa's paper.

In the past three years the Spring Valley Water Company has constructed two concrete-lined reservoirs, each having a storage capacity of five million gallons, and have increased the storage capacity of a third—the University Mound reservoir—from 41,000,000 to 59,000,000 gallons, a gain of 18,000,000 gallons storage, by raising the present embankment 6 feet and lining it with concrete. In the two 5,000,000 gallon reservoirs recently constructed, the general problems of design were similar but the method of construction and some of the details were different. One of these, the Stanford Heights reservoir, located in the western portion of the city at elevation 600, was constructed to meet the increased demand of the new residential district between elevations 400 and 500 feet in that region. It is located on a hillside having a slope of about 7 to 1, that is, seven horizontal to one vertical. A full city block 663 feet long and 228 feet wide was available at the particular elevation and location. An excavated and rolled embankment reservoir for 10,000,000 gallon storage was designed to cover the entire block, with a reinforced concrete division wall in the center dividing it into two equal parts.

FOR OUR present needs only one-half capacity or 5,000,000 gallon storage was required; so the westerly half was constructed in the spring of 1923. This portion is 300 feet by 155 feet on top, 215 feet by 88 feet on the bottom, and is 22 feet deep with inside side slopes of 1½ to 1 and outside embankment slope of 2 to 1, and crest of embankment 10 feet wide. It is lined with a 6-inch slab of reinforced concrete placed in 30-foot squares on the bottom and 20 feet by 40 feet sections on the sides. The lining has total of 5/10% temperature reinforcing, or 2½/10% in each direction, consisting of one-half inch square bars spaced 16 inches both ways; each section is separated from the adjoining section by expansion joints.

A tar and gravel roof is supported by 8 inches by 8 inches precast reinforced columns 24 feet long spaced 20 feet apart; these columns are reinforced with four one-half inch bars and were set in precast concrete footings grouted to the floor and side slabs. The roof beams are two 3 feet by 12 inch Oregon Pine, 20 feet long, rafters are 2 inches by 8 inches by 20 feet long, spaced 30 inches, on which is placed a 1 inch by 10 inch pine flooring covered with a paper tar and gravel covering. The excavation and rolled embankment was made as if the entire 10,000,000 gallon reservoir were to be finished, leaving the easterly end open. This end was closed by a reinforced concrete division wall designed and constructed to withstand the full head of water from either side, the other side being empty. This wall is 22 feet high, 10 inches thick on top and 15 inches thick on the bottom and is supported with 14 inches thick counterforts on both sides spaced about 9 feet apart.

The wall and counterforts rest upon a slab of concrete 20 feet, 3 inches wide and 22 inches thick. The outlet gate and screens are contained in a square concrete tower set in the division wall and made a part thereof. It is divided

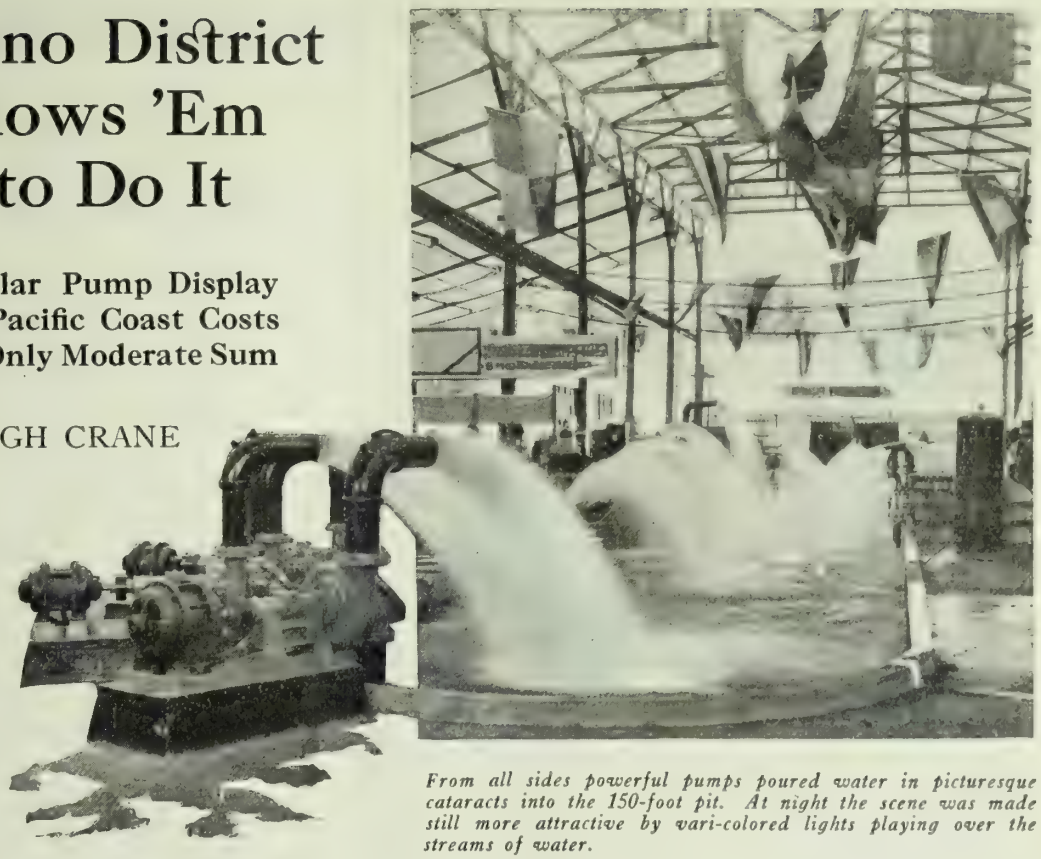
The Fresno District Fair Shows 'Em How to Do It

Most Spectacular Pump Display Ever Held on Pacific Coast Costs Management Only Moderate Sum

By HUGH CRANE



From all sides powerful pumps poured water in picturesque cataracts into the 150-foot pit. At night the scene was made still more attractive by vari-colored lights playing over the streams of water.

QUESTION: Is it possible for irrigation to be given something approaching adequate representation at a county, district, or state fair, without excessive expense? Can such representation be planned in such a way that the irrigation farmer who is interested in seeing a practical and helpful display of irrigation equipment may find his desires realized?

ANSWER: Yes,—the display of equipment planned and carried out at the recent Fresno District Fair, Fresno, California, affords proof that such an exhibit is possible, at moderate expense. Moreover, the Fresno fair serves as an excellent object lesson for similar organizations throughout the irrigation country.

MODERN fairs sometimes shoot wide of the mark in neglecting the primary purposes for which such institutions are established. Side-shows, catch-penny amusements, games of so-called chance, and horse races, too often eclipse the proper function of displays of agricultural and industrial products which should bring to the farmer and the manufacturer a chance to exhibit what they produce to those who are concerned in using those products.

To manufacturers and dealers in irrigation equipment in all parts of the west, and to irrigators, who have looked in vain at such exhibits as the California State Fair for representative displays of the new and up-to-date phases of irrigation equipment, the story of what was done at Fresno will come as an encouraging indication.

The Fresno District Fair has no money to throw away on extravagant displays for any industry. It is a self-supporting organization, operating at a small profit, assisted by small appropriations from Fresno County from time to time, and a state appropriation of $3700 per year for premiums. The state appropriation is, of course, a very small one compared with the annual appropriation of $85,000 for the state fair, held at Sacramento.

FRESNO, however, recognizes the importance of irrigation as the basis of all the products which make state and district fairs possible. Under the direction of A. V. Jordan, manager of concessions and exhibits, the Fresno fair this year planned and executed what has been declared the largest and most spectacular display of pumps ever held in California—and probably in the world.

A new pump pit was constructed in a central location, into which the exhibited equipment might pour as foaming streams of water in a picturesque cataract. The pit is 150 feet long, fifteen feet wide and ten feet deep, sides and bottom constructed of reinforced concrete. The concrete walls are six inches thick at the top and 12 inches thick at the bottom. The capacity of the pit is 170,000 gallons.

This tank, the total cost of which was only $4300 (defrayed by Fresno County), affords a total display of 328 lineal feet. The photograph appearing on this page gives a suggestion of the spectacular appearance of the exhibit when the pumps were operating. It was made still more attractive at night, when vari-colored lights were thrown over the streams of water.

Mr. Jordan, who has been active in making the Fresno District Fair a success for the past five years, declares that the pump display made a tremendous impression on both exhibitors and those who attended the fair as sight-seers.

"Our purpose has been," declared Mr. Jordan, "to anticipate the needs of exhibitors and to meet those needs in the interest of making the fair of maximum utility to those whom it is designed to serve. From the enthusiastic reception given to our irrigation equipment display in 1925, it seems assured that it will be necessary next year to lengthen the pit to provide additional display space. I am sure that all available space will be spoken for long before the 1926 fair opens."

MANUFACTURERS of and dealers in equipment in California have been particularly interested in the Fresno display on account of the example which it sets to the California State Fair, at which the attention devoted to irrigation in past years has been unsatisfactory.

VOL. I NOVEMBER, 1925 No. 5

The Engineer

AN UNOFFICIAL observer, who sat through the two days of hearings of the Senate committee in Los Angeles during October and heard an immense mass of testimony from witnesses, including many different classes of men who have a common interest in irrigation and especially in the Colorado River, exclaimed, at the end of the second day: "What a difference between the testimony of the layman and the engineer! The engineers know what they are talking about."

Perhaps the remark was unkind to the men who testified who were not engineers. Many of them are men who have learned the lessons of irrigation in the stern school of experience, which offers some wonderfully practical courses based on the case system. But the observer's exclamation contains much truth, and suggests much more.

The engineer does know what he is talking about, and for that reason he is the man to whom the irrigation industry looks for safe guidance in its development. Without the engineer's advice the industry can not safely proceed.

The Key Man

THE KEY man in the forward march of irrigation is the engineer. The others have their indispensable roles to play—the financier, who accumulates the surplus of many investors and makes them available for the construction of large works, in turn to create new wealth; the executives, who bring to the direction of irrigation activities the results of their years of experience with problems of business and of agriculture; and the farmer, who invests his time, his labor and his very life in the effort. But each of these needs the counsel and skill of the technical man.

The conservation of our water supplies and their efficient applicaiton must depend, in largest measure, upon the men especially fitted, by training and experience, for the solution of these problems. They call for the highest degree of skill, knowledge and judgment. The engineer, all other things being equal, is the man best qualified to make sound judgments of such problems, by virtue of his specialized training and experience.

The study of water supplies and the methods of utilizing them is essentially the engineer's duty. In cases where the judgment of the engineer conflicts with the judgment of others, in such matters, it would seem the part of wisdom to support the engineers' conclusions until they are proved unsound or ill-founded.

There is not always agreement even among engineers. They may, and frequently do, differ in their conclusions over important questions, even after full consideration has been given to all the engineering and technical data available. Despite such discrepancies, the truth remains that men trained in these particular subjects are more likely to reach correct conclusions from the consideration of the physical facts of a problem than men not especially trained to analyze and weigh such data.

When a medical problem is involved, we turn unhesitatingly to the physician. If a point of law is at issue, we consult the attorney. In neither case do we feel that we can safely place our confidence in men not especially educated and experienced in these subjects. Should we not show something of the same confidence in the engineering profession?

The Fresno Fair

IN ANOTHER part of this number, a staff contributor has told of what was accomplished by the recent Fresno (California) District Fair in the way of working out a representative display of irrigation equipment. For a long time the equipment men have been impotently voicing their dissatisfaction at the inadequate attention paid to irrigation at the California State Fair, held annually at Sacramento.

In spite of the fact that the state fair is supposed to be primarily an agricultural display, and the further fact that agriculture in the west depends, primarily, on irrigation for its existence, it appears

POINT *Of* VIEW

that the management has been slow to recognize this industry. Irrigation's meagre displays have been poorly housed, carelessly planned and inconspicuously placed, far from the center of things at the fair.

It is useless to scold about the past; not only useless, but it defeats its own purpose. Manufacturers and dealers who want a better display of irrigation equipment at this state-wide exhibit of agricultural and industrial activities are willing to forget their past grievances, but they are most anxiously hoping for better things in the future. The fact that the Fresno District Fair, at comparatively little expense, has been able to give these manufacturers and dealers a display on a scale better calculated to represent the industry, is accepted as a happy augury of what may be expected at the Sacramento Fair. The Fresno Fair has shown that it can be done, and, with the determined insistence of the equipment men to influence them, the state fair officials will do wisely to see to it that future irrigation displays are planned on a scale more proportionate to the great industry on which California's prosperity is fundamentally dependent.

A Significant Decision

AN interesting decision has recently been rendered by the Federal Power Commission in the case of the conflicting claims of the Nevada Irrigation District and the Yuba River Power Company to water rights on the Yuba River, in northern California. In this case the two interests desired to use the waters of the middle fork of the river, the irrigation district seeking to divert the waters across the south fork of the river and to use them for irrigation and power development, and the power interests wishing to divert them to the north fork, where they could be utilized to advantage in connection with a major power development.

There was a conflict involved between the desire on the part of the power company to use the water for hydroelectric development, on the one hand, and the desire on the part of the irrigation district to combine both irrigation and power development in their use; although those who opposed the contentions of the irrigation district asserted that the irrigation use of the water would actually be secondary to its use for the generation of power, if the award were made to the district, which has a contract with the Pacific Gas & Electric Company which allows it to use the water of the district for power generation between the dams of the district and the lands to be irrigated.

The diverse claims were advocated strongly over a four year period before the Federal Power Commission and the California Division of Water Rights. An earlier decision of the Power Commission granted the application of the Yuba River Power Company, but at a recent hearing it revoked that decision and made a new ruling recognizing the superiority of the irrigation district's claims. The decision of the Federal Power Commission, "after full consideration of the information presented to it by its staff" authorized the issuance of a license to the Nevada Irrigation District. The action was in accordance with the laws of California which give preference to the use of water for irrigation over its use for power.

In this decision the Federal Power Commission has ruled wisely. Important as is the development of power—and, indeed, irrigation and power are interdependent and complementary, not antagonistic—irrigation is nevertheless the more essential; and where there appears such a conflict as existed in this particular case, the irrigator must be given the prior right to make use of nature's resources.

It's Always Important

A CORRESPONDENT has written to the editor approving some of the material published in recent issues on the subject of forest protection and reforestation. He affirms his belief in the value of such articles as have appeared from time to time, and makes a suggestion dealing particularly with the reforestation of lands contiguous to dam sites. Writing from San Diego, California, he declares:

" 'Forest fires' (meaning, often, the burning off of large areas of brush) in such sections as San Diego County add to a bad enough condition. I have visited every dam site in this vicinity, for instance, and none of them are surrounded by forests as they should be. Waste land is all about them —and no trees. Yet we hear it said that 'condensation loss' is unavoidable. I have 'talked my head off' for years, but it is of no use. Somebody should be doing something *now* for our grandchildren and their great grandchildren. I should like to see you publish lists of suitable trees; where seeds may be produced; how and when, and where they should be planted, etc. . . . In some way we should be getting action on conditions around dam sites and impounded waters. Water taken out of these reservoirs to start the growth of trees should prove a good investment, it seems to me, and it would provide work for the dam watchman, who could plant and water the trees. . . . Cannot you get some strong articles covering this condition, and persistently publish something in each issue concerning the value of reforestation?"

MODERN IRRIGATION has repeatedly declared itself on this important subject and is glad of the opportunity to reaffirm its faith. Reforestation is a policy on which there is no room for argument, but much need for action. By articles already published on various phases of the problem we have begun to do what we can toward advancing the gospel which our San Diego friend carries so near to his heart, and we have only just begun to fight. We shall continue to wield whatever influence these columns can command in the interest of doing something to protect the interests of the "grandchildren and great grandchildren" to which he refers.

Methods and Standards of Service Installation

Superintendent of Meters and Service Discusses Practices of Los Angeles Department

ONE OF THE interesting and practical papers presented to the Sixth Annual Convention of the California Section, American Water Works Association, at Santa Cruz, in October, was a discussion of service installation methods and standards as practiced by the Bureau of Water Works and Supply of the city of Los Angeles. The paper was prepared by George Read, superintendent of the meter and service department of the bureau, and was read before the convention by A. P. Lovell, water superintendent of San Diego.

At this date—the paper began—all domestic water connections for new subdivisions are being installed by laying a pipe from the main to just inside the curb on the dividing line of the two lots, equipped with two outlets.

On cast iron water mains, a saddle having a 2½-inch female standard iron pipe thread, is strapped to the main. On cast iron mains from 12-inch and up, a bronze saddle is used on account of safety. On sheet steel or iron main, a heavy coupling is electrically welded and takes the place of a saddle.

INTO saddle or coupling is screwed a bronze corporation cock having a male 2½-inch standard iron pipe thread on one end and a leaded bell and outer 4-inch standard iron pipe thread on the other. The outer standard 4-inch thread is used for tapping purposes and can also be used for the laying of standard screw pipe. Five-foot lengths of 2-inch cast iron pipe, ¼-inch thick, weighing 6½ pounds per foot, with lead prepared joints, are then run from the bell end of the corporation cock to just inside of the curb. We have tested this pipe to over 1,000 pounds per square inch.

The five-foot length that ends just inside the curb has a two-inch standard iron pipe threaded end on which is screwed a two-inch cast iron elbow. Into this elbow is screwed a two-inch galvanized iron pipe riser about twenty inches long equipped with 2x2 cast iron tee; the latter being equipped with bronze bushings reduced to the size of the services required at the date of installation. Bronze bushings are used on account of ease of removal, etc.

Both these outlets can gradually be enlarged up to 1½-inch without digging in the street and if both lots are acquired by one person and a large building is to be erected, the service can be made into a two-inch.

When tapping large trunk lines a two-inch shut-off is placed just inside of the curb, to be used when enlarging a service; otherwise, small mains are shut off for a few minutes while making enlargement.

In new subdivisions where we are not sure of the location of driveways, a ten-foot piece of galvanized iron pipe, equipped on each end with a curb cock, is run both ways from the tee on the riser. Curbcocks that are not immediately put in use are sealed and can be used for flushing purposes, if it ever becomes necessary.

GALVANIZED iron or steel service pipes already installed in streets that are to be permanently paved are being renewed in the same manner, and the Department is endeavoring to have an ordinance framed that will make it compulsory for all vacant lots to be served in advance of the paving. The cost of such installation may be included in the assessment for the street paving. Public sentiment is in favor of all utilities being installed in advance of paving.

This method of service installation means good supply to the curb; it practically eliminates the cutting into paving for the renewing and enlarging of service pipes and it means low maintenance cost. It also means one-half the present cost to the consumer, when enlarging is necessary. Its construction is identically the same as for standard cast iron water mains. At this date we have used for service installation 233,500 feet of this cast iron service pipe.

The average cost per two-inch cast iron service including the fittings, etc., for two supplies taken from same for ¾ and 1-inch sizes, is $34.25 each. This cost includes 10 per cent for supervision, etc.

Galvanized iron pipe is used instead of cast iron for hillsides and fills. This pipe is asphaltum painted, wrapped with burlap and repainted. Single installations scattered over the city, are being installed with galvanized iron pipe. Standard corporation cocks are inserted into cast iron mains up to 1-inch. Above 1-inch, saddles are used on cast iron mains and couplings electrically welded on sheet steel and iron mains of large diameters. Couplings are also electrically welded on standard screw mains carrying heavy pressures.

PRESSURE regulators are placed on services carrying over 125 pounds. These regulators are placed in front of the meter, at the expense of the consumer. They are maintained by the Department, but the Department is not responsible for damages caused by their getting out of order.

Lead goose necks have practically been eliminated. The coupling nut tail piece formerly used for lead flanging is now threaded, into which a street elbow is screwed and left looking downward. A short piece of pipe reaching the bottom of the excavation is then screwed into same, which is equipped with a swinging joint to connect to pipe leading away to the curb. The whole idea is to make the connection so that it will not be sprung by the settling of the earth. A fairly hard rubber gasket that will stand steam is used in connecting the coupling nut to the corporation cock.

The few leaks that we have had were not due to this method. We consider this method superior and cheaper to the lead goose neck because when a coupling nut is screwed up tight on a lead goose neck, the lead goes on compressing, due to tension, and in a short while becomes loose so that a little settling of the earth starts a leak.

Galvanized iron service pipes are laid by hydraulicing, driving or digging a ditch. The soil conditions, etc., determine the method. A truck carrying an air compressor, equipped with paving breakers, cuts the paving in advance of the service crews. This is costing the Department 22 cents per square foot. Services larger than two-inch for domestic, commercial, irrigation or fire protection, are all taken from the main by either clamping or welding on a heavy coupling. A tapping nipple is either leaded into a clamp or screwed into a coupling. A gate is placed on the tapping nipple through which the main is tapped. Tapping machines from 1½-inch to 8-inch are made by the Department and an 8-inch service is the largest we have at this date.

WROUGHT iron pipe is used for irrigation services and cast iron for all other purposes. When a fire service is installed, a tee is placed on same just inside of the curb for the domestic supply, and a gate is left controlling the fire line into the building and also a gate to control the domestic supply. A Monthly Bulletin Board of Brief Facts and Events from Far and Near

Big Return on Cotton

Farmers on the Elephant Butte Irrigation Project will receive more than $12,500,000 for their 1925 cotton crop, according to estimates made by El Paso (Texas) bankers. The estimated cotton production on the project for the year is 100,000 bales.

Directors Trial Postponed

Trial of the four directors of the Imperial Irrigation District who are accused of malfeasance in office in connection with the alleged misuse of district funds in the interest of the Swing-Johnson bill has been postponed until January 11 by Judge Franklin J. Cole, who is hearing the case.

Rains Cause Canal Break

Recent heavy rains in the neighborhood of Calipatria caused a thirty-foot break in the east highline canal of the Imperial Irrigation District and a number of minor breaks in waste and lateral ditches. Crews rushed to the scene remedied the trouble and repaired all the breaks without interrupting the delivery of water.

To Form 8,000-Acre District

Farmers of Santa Cruz Valley, New Mexico, are planning for the creation of an irrigation district to embrace 8,000 acres in Santa Fe and Rio Arriba Counties. An election early in November will decide whether or not such a district will be formed. The tentative plans of the district are to build a storage reservoir by damming the Santa Cruz River.

Plan Northwest Compact

At a meeting of state and federal hydraulic engineers at Spokane, Washington, on October 31, preliminary plans for a four-state compact for the division of the waters of the Columbia River were to be drawn up. Representatives of Washington, Montana, Idaho and Oregon met at the Chamber of Commerce Building with R. K. Tiffany, state hydraulic engineer of Washington, to discuss interstate irrigation problems related to the Columbia's waters.

Chino District Plans Dam

The Chino Valley (Arizona) Irrigation District has been authorized, following an election at which the proposed issue was endorsed by the land-owners of the district, to bond itself for the construction of the Willow Creek Dam. The proposed dam is expected to cost about $40,000 and the bond issue will probably be about $75,000.

Dam Construction Progresses

Construction work on the Continental Reservoir Dam of The Del Norte, (Colo.) Irrigation District will be completed in early 1926. The dam is of the earth and core-wall type and when completed will give storage capacity of 32,000 acre-feet. The work on the diversion dam across the Rio Grande River was done in 1924-25, and the main canal and laterals completed in 1925. Carl A. Gould is engineer in charge of construction.

East Bay District Sells Bonds

An issue of $5,000,000 in bonds of the East Bay Municipal Utility District, California, was recently sold to a banking syndicate headed by the Bank of Italy and including, among others, W. R. Compton Co., Marshall Field, Glore, Ward & Co. The winning bid carried with it a premium of $110,000. The second and only other bid was made by a National City Company group; its bid carried a premium of $75,000. The bonds are a five per cent serial issue.

Dynamite to Block Leaks

An unusual hydraulic feat was attempted recently in the Tumalo, Oregon, Reservoir. The reservoir was losing considerable water through underground caverns, and the engineers in charge attempted to block these leaks by the explosion of a large quantity of dynamite in the caverns. The reservoir gates were first closed for three weeks, to provide a sufficient head of water. Several boxes of dynamite were then floated into the hill where the leak existed, and exploded. Whether the experiment was successful or not has not yet been determined.

Reservoir For Hood River

The Hood River (Oregon) Irrigation District, at a recent meeting of directors and taxpayers, decided to proceed with plans for the construction of a reservoir, without which the district will suffer for the lack of adequate water supply. The work will be extended over a period of several years, according to the scheme outlined by the district, $10,000 to be devoted to the first steps.

Changes Will Save Money

Changes in the power plant of the Donna Irrigation District No. 1, Hidalgo County, Texas, will save the district $20,000 a year in operating expenses, according to Engineers W. T. Shaw, of Mercedes, and A. Tam, of Harlingen. The three pumping plants of the district are to be provided with electric motors, replacing internal combustion machines. The cost of the substitution will be about $50,000.

Idaho Officials in Meeting

Plans for supplying lands between Pocatello and American Falls with irrigation water were discussed at a recent meeting of state, federal and Indian officials of Idaho, at Pocatello. Some of the lands under discussion are located on the Fort Hall Indian Reservation. Under the original plans for the American Falls development part of these lands only were included under the project. Recent changes, according to Warren G. Swendsen, state reclamation commissioner, will bring all these lands under irrigation.

1925 Fire Loss Reduced

Fire statistics for California, issued by Paul G. Reddington, United States district forest supervisor for California, show a material decline in fire loss for the summer of 1925.

While the total number of fires for 1925 was 1844 as compared to 1805 in 1924, suppression expense amounted to only $151,807, as against $678,687 for the previous year. Another striking contrast exists in the total burned area inside and adjacent to the national forest lands. For 1925 only 90,335 acres suffered, while during the previous year 601,628 acres were burned.

Geological Survey Publishes Report on Colorado River

E. C. LaRue is Author of Comprehensive Work Summarizing Study During Fifteen Years

The Department of the Interior has just issued a comprehensive report on the Colorado River as a result of engineering studies by the Geological Survey. The author is E. C. LaRue, hydraulic engineer, who has made a study of the river during the last 15 years, in the course of which he has made boat trips aggregating nearly 2,000 miles along the river and its major tributaries, including the whole of the Grand Canyon.

The basin of the Colorado, declares the report, affords the second largest concentration of irrigable lands and water power sites in the United States. Irrigation in the basin has been extended slowly but steadily until more than a third of the land irrigable from Colorado River is now receiving water. With the river as now regulated the present irrigation consumes the entire low-water flow, and in occasional dry years there is a water shortage.

Further development of irrigation is dependent on storage of flood waters and regulation of discharge. The power resources of the Colorado are as yet practically untouched, but a heavy demand for electric energy in the Southwest is now about to force a rapid development of all available power sites on the Colorado within reasonable transmission distance of the markets. As with irrigation, so with power, less than a third of the potential energy can be developed unless storage of flood waters and regulation of discharge are provided for.

The report points out that the Colorado River at present is not only a source of water supply for hundreds of thousands of acres, but a menace to these lands. The danger of a recurrence of flow to Salton Sea repeating the disastrous breakover of 1905, is ever present, and the safety of great areas of highly productive land and prosperous towns can be assured only by storage of flood waters and maintenance of a well designed system of levees and the bank works protection. Thus safety from inundation, complete use of waters for irrigation, and adequate development of potential power are all factors which demand storage and regulation works.

The Geological Survey report is published as Water Supply Paper 556. It deals with the comprehensive development of Colorado River below the mouth of Green River, with particular reference to flood control and the development of hydroelectric power. Records of stream flow are summarized, and estimates of water supply available at many points under a variety of conditions are presented. The principal reservoir sites are described, and their availability and usefulness are discussed. Plans, cross sections, and area and capacity curves, together with engineering and geologic discussions, are presented for all known dam sites on nearly a thousand miles of river, all of which has been surveyed and mapped.

Hydraulic Engineers In Washington for Annual Meeting

Geological Bureau Men From 22 States Discuss Matters Related to Their Work in All Parts of Country

District hydraulic engineers of the Geological Bureau from twenty-two states and Hawaii gathered in October at the Interior Department in Washington for the regular biennial Washington meeting.

After conferring with the Chief Hydraulic Engineer of the Bureau on matters of technique and policy relating to the investigation of the water resources of the United States, the engineers held a meeting with Secretary Work.

The problems considered by the engineers during the conference in Washington involved matters of water supply related to river regulation or flood control, irrigation, drainage, waterpower, and municipal water supply. This includes the measurement of the flow of rivers and their tributaries throughout the United States covering long periods of years—in almost all states. A large part of the work is carried on in cooperation with the states, the state organizations generally more than matching the Federal expenditure for the work.

At the present time some thirty states are cooperating with the Federal government under this arrangement and more than 1,700 stream measuring stations are being maintained throughout the United States and Hawaii.

Counts State's Trees

M. B. Pratt, state forester of California, has concluded a job compared to which any of the labors of Hercules were child's play. He has counted the number of trees in the forests of the state, and in a recent statement declares that there are 569,000,000 of them. The total, which includes only trees over 18 inches in diameter, represents the stand of commercial timber in California and involves 284,505,000,000 board feet. The estimate does not include ornamental and shade trees.

Complete Silt Survey of Roosevelt Reservoir

Accumulation of 101,000 Acre Feet in Twenty Year Period Revealed by Investigation

The Salt River Valley Water Users Association has just completed a silt survery of the Roosevelt Reservoir, showing a total accumulation of silt in the twenty years since the dam was begun, of 101,000 acre feet. This is a reduction in the capacity of the reservoir of less than 1-16 of the total, and at that rate it would take 320 years to completely fill the lake. Officials of the Association state that while it would seem at first thought that the present generation need have little concern as to the usefulness of the reservoir being greatly decreased by the deposition of silt, this is not the case. The use of 100,000 acre feet of water stored in Roosevelt Reservoir has a very high value for power alone. Run through the entire power system of the project, including the Horse Mesa and Mormon Flat plants, this would represent some 35,000,000 k. w. h., or a value of around $250,000. This amount would be available on an average over every three-year period. Therefore from this standpoint alone the loss of power revenue would make decrease in storage capacity at Roosevelt a serious consideration to the present day water user.

The present silt survey is one of four made since the dam was built, the others being made in 1914, 1916 and 1919.

Three Counties Apply For 250,000 Ac. Ft. on Santa Ana

Southern California Conservation Body Plans to Protect and Conserve Water Supplies

The collective determination of three Southern California counties to conserve and protect their present and future water supply is manifested in the recent application by the San Bernardino, Riverside and Orange Counties Conservation Association for 250,000 acre feet of water from the Santa Ana River watershed.

In the application the association sets forth that the water is to be conserved in surface and sub-surface reservoirs and retained by check dams and other means, from the crest of the San Bernardino mountains to the point of discharge of the Santa Ana system. The water will be used in supplementing irrigation water on land already irrigated, and for maintaining and increasing the domestic water supply of San Bernardino, Colton, Riverside, Orange, Santa Ana, Placentia, Anaheim and Huntington Beach.

New Officials Named to Lead Oregon Reclamation Body

The Oregon Reclamation Congress, (formerly the Oregon Irrigation Congress) elected a new president and secretary in a spirited session which concluded their three-day session at Grant's Pass early in October.

In a close contest for the presidency of the organization, Wilford Allen, of Grant's Pass, was elected to succeed James M. Kyle, of Stanfield. W. L. Powers, of the Oregon Agricultural College, Corvallis, was unanimously named secretary, succeeding Walter E. Meacham, of Baker. Prof. Powers has been prominently identified with irrigation and reclamation activities in the state and for ten years has been secretary of the Oregon Drainage Association.

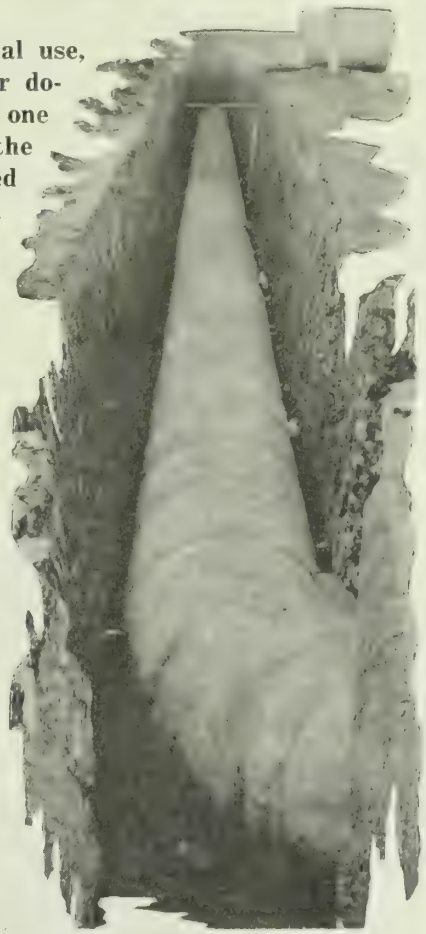
According to the recently adopted constitution of the Congress trustees must be elected by each of the three districts into which the state has been divided, to represent their respective sections in the work of the Congress. The first congressional district, comprising western Oregon excepting Multnomah County, has named the following as trustees: Olin Arnspiger, manager of the Talent Irrigation District; Ralph Cowgill, engineer of the Medford Irrigation District; J. W. Lucas, manager of the Chicago Land Company; Rhea Luper, state engineer of Oregon, and J. T. Jardine, director of the state experiment station at Corvallis. The third congressional district, which is coterminous with Multnomah County, has chosen R. M. Townsend, George Myers, John Beall and C. G. Brownell, with Marshall Dana, of the Oregon *Journal,* as chairman of the group and a member of the executive committee of the Congress. Each of the three groups will name a chairman, who will automatically become a vice-president. With the president and the secretary, these three chairmen will comprise the executive committee.

Approve Idaho Issue

The Idaho Reclamation District Bond Commission has approved the certification of $159,000 in bonds issued by the Jefferson Irrigation District. The district has 5000 acres of land, of which about 1000 is under cultivation. Water is obtained from Jefferson reservoir, North lake, and artesian wells. The district proposes to take $150,000 from the proceeds of the bond sale and purchase and improve the irrigation system. The remaining $9000 is to be used to pay the first year's interest on the bonds.

Building an Industrial Empire *with Water and Concrete*

WATER—for industrial use, for irrigation, and for domestic consumption—is the one indispensable resource of the West. It has transformed vast semi-arid areas into an empire of wealth and population. Concrete pipe has, to a large extent, assisted in this development.



48-INCH RE-INFORCED PIPE

It has been the privilege of the Bent Concrete Pipe Company to cooperate with many of the great water projects of the West, in making these improvements possible.

Ready, at all times, to locate a factory in any community for the manufacture of concrete pipe "on the ground and on the job," we have combined *western enterprise* and *western cooperation* with the natural economies effected by our large organization.

"If it's a Bent job, it will be well done," has become an axiom among those who install concrete pipe systems—large or small—for either sewers and storm drains, pressure lines, land drainage or irrigation.

IRRIGATION MANAGEMENT

CHECKING WATER LOSSES ON IRRIGATED LANDS

HOW MUCH of the water diverted for irrigation use ever gets to the plant in beneficial form is a question that has repeatedly been investigated and discussed, and frequently measured with a fair degree of accuracy, but is always an important and practical question for the irrigator. Recent investigations on irrigation enterprises in Washington have revealed some interesting results.

The losses between point of division and point of delivery to the farm have been more or less accurately measured on many government projects and numerous private systems. On the Sunnyside division of the Yakima project, for instance, the average of the total conveyance losses for the last three years have been: 28.4 per cent for 1922; 27.5 per cent for 1923, and 27.9 per cent for 1924.

The losses which occur, however, after the stream reaches the farm have not often been measured. In fact, they have scarcely been investigated or realized, and in most cases they are difficult to measure accurately.

The sequence of these losses from the farm may be listed as follows: (1) seepage and evaporation from the farm ditches and flumes; (2) evaporation from irrigated fields; (3) deep percolation losses from the irrigated fields—below the feeding zone of plants; (4) surface run-off.

ON The irrigation branch experiment ment farm at Prosser an attempt has been made this year to measure some of these losses. The seepage and evaporation loss from one of the farm irrigation lines which consists of 285 feet of earth ditch and 725 feet of 10-inch flume was measured by discharging the water over one cippoletti weir at the head of the line and over another at the foot of the line. The difference between the two measurements represent the loss by seepage, leaks and evaporation. Both ditch and flume are kept in fair condition. The amount of water carried varied from 0.5 to 1.5 second feet. From all the measurements made during the season the average loss was 6.0 per cent.

Evaporation from non-cropped irrigated fields was measured by means of six small checks or basins to which measured quantities of water were applied. The basins were 30 feet square, each surrounded by a dike about 12 inches high. Soil moisture determinations were made to a depth of six feet immediately after irrigation and again 21 days later. The difference in moisture found in this 6-foot blanket of soil between the two sampling dates was considered to represent the loss by evaporation—when there was no percolation below the sixth foot. The average of these results show a 35 per cent loss.

It can not be said that the percolation was measured. It was estimated. The estimate was based on previous experiments which give fair knowledge of the water holding capacity of the soil, the evaporation rate of water from the soil, and the time it takes for irrigation moisture to come into equilibrium with gravity. This estimated percolation loss amounted to 16.5 per cent.

SURFACE run-off was measured by catching it from one plot at a time in one channel and passing it through a submerged orifice equipped with a Lyman meter which records the discharge in acre feet and fractions thereof. This loss averaged 12.5 per cent.

To summarize these results then, the total loss through the four sources mentioned in the foregoing, was 70 per cent. This leaves only 30 per cent of the water received on the farm for actual use by the crop plants. And only 21.6 per cent of that diverted from the source.

Duck Clubs Are Problem

At a recent meeting of the permanent committee of the Sacramento-San Joaquin River Problems Conference, detailed consideration was given to the problems incidental to the duck clubs on the Sacramento River. Fifty gun clubs have been appealed to for co-operation in increasing the flow of the river, with only fair success, it was reported. During the last two seasons the use of water in filling duck ponds has conflicted with the needs of navigation and irrigation. Suggestions were made for various means of eliminating this conflict, including the shortening of the duck season by fifteen days. The duck season now begins on October 1, and it is believed that the opening date should be postponed to October 15.

Irrigation Important Operation in Growing Good Alfalfa

Interesting Data on Water Demands of This Crop are Revealed by Recent Investigations

Growers of alfalfa, declares an exchange, are almost without exception greatly interested in irrigation for irrigation is usually the most important operation involved in growing a successful crop.

Large and profitable yields are not grown without plenty of water, correctly applied; yet in many parts of the alfalfa growing districts water is limited in amount and expensive to use. The practice of the most rigid economy consistent with adequate irrigation is therefore essential.

Five hundred pounds of water are required to produce one pound of cured alfalfa hay. If a yield of 1.5 tons per cutting is secured it would require 500 times 3000, or 1,500,000 pounds of water per cutting. This is equivalent to 6½ inches of water and represents ordinarily for a sandy loam a little more than one-half of the available soil moisture for plant growth in the upper six feet of soil.

The depth and extent to which water has penetrated may usually be determined 24 hours after irrigation has stopped. The movement of water stops

when the soil is filled to its maximum water-holding capacity with practically no movement of capillary water from a wet to a dry soil (except from a free water surface as in the case of a high water table).

THE Irrigation Division of the University of California has been carrying on an extensive survey concerning the irrigation practices in the Sacramento Valley. The following are some of the data which were collected: Silt loam with a sandy subsoil is usually irrigated four times and 15 inches are applied for each irrigation. Of this 15 inches only 5½ inches was retained in the upper six feet of soil which is equivalent to 37 per cent. Six to eight inches would have been sufficient, applied once or twice during the growing season. On the clay loams four irrigations were applied with 8.78 inches per irrigation. Forty per cent of the water was retained in the upper six feet of soil. One or two irrigations of 4 to 6 inches should have been applied. The heavy clays were found to have been irrigated eight times with 3½ inches per irrigation. Four to eight irrigations, applying two inches each time should have been applied.

In any investigation of the proper duty of water, the size of the irrigation head used, and its relation to the type of soil, the method of irrigation followed and the size and slope of the areas watered with a single head are naturally always important. Fields may be well prepared and evenly surfaced and yet the results will be excessive waste or inadequate irrigation if the amount of water turned into each check is too large or too small. It may well be asked, What becomes of the water applied on many of the Sacramento Valley fields? It is obviously important that it is necessary to stabilize the irrigation heads used with reference to the size of check and the character of the soil. Data collected from twenty-five fields in the Sacramento Valley furnished information on this particular problem. Five classes of soil were covered, gravelly loams, sandy loams, silt loams, clay loams and clays.

From an investigation of the data gathered in these investigations, it is evident that the most desirable head of water to use on any given soil can not be adequately determined by comparing use on different fields. The present general practice in Sacramento Valley, expressed in cubic feet per second per acre, is, however, satisfactorily indicated from the average figures obtained, namely, 23 for gravelly loams, 10.9 for sandy loams, 8.8 for silt loams, 7.3 for clay loams, and 3.2 for clays. The difficulty of irrigating porous soils with small heads and of irrigating clay soils with large heads is well recognized among irrigators, even if the most satisfactory relationships have not been worked out in detail.

A COMPARISON between irrigation heads and depths of application on single fields makes it plain that in many cases either the head of water used should be increased or the area of the checks should be reduced. In summarizing, it was found, with a few exceptions, that in each instance where the soil was sandy loam, or silt loam, the depth of water applied increased as the rate of application decreased. In one case where a relatively small head was used, a depth of three feet of irrigation water was used before the surface of the field was flooded. In four cases, more than two feet of water was applied per irrigation and in 14 cases out of 27, the depth of each irrigation exceeded one foot. Measurements of the amount of water required to cover a one acre check having a slope of 3½ inches per 100 feet were made at Davis, California.

Data obtained were as follows:

Rate of application, cu. ft. per sec. per acre	Depth of water required, ft.
4.6	2.75
10.1	1.86
13.5	1.1
15.3	0.84
17.8	0.69

Until the proper relation between irrigating heads and size of check is worked out, there is certain to be much difference of opinion as to whether small checks and small irrigation heads, or large checks and large heads should prevail in alfalfa irrigation. In the case of individual pumping plants which rarely discharge more than one or two cubic feet per second, checks necessarily are small. Thoughtful consideration on the part of irrigators will in time work out the best ratio between the head of water to use and the size of check. It is clear, though, that the irrigation head can not be a constant quantity but must be varied where practical with the different soils found on nearly every farm.

WASTE WATER UNNECESSARY UNDER THIS SYSTEM

By NEWTON HIBBS
Twin Falls, Idaho

IT IS MOST important to allot and deliver to the land the minimum quantity required to procure the highest return for the water regardless of maximum possible production of the land. Necessity will then force extreme conservation on the part of the farmer.

Several years of experience in power pumping at a high cost made me a water conservationist. I learned to apply the irrigation water evenly to every unit of the field and to waste none of the costly crop requisite.

The fact that waste water causes great loss of fertility from the soil through which the water drains, waterlogs the catch-basin areas, and causes great expense of drainage makes the elimination of waste water a matter of great economic importance.

Nobody will dispute the logical fact that the determination of the crop demand is practicable under all conditions of soil structure, topography, and climate. Also that infinite care and labor would make even distribution of the allotted water possible. And if no more water is supplied than the crop demands and consumes, there will be no waste water. Economy of distribution then becomes the problem to be solved to eliminate an estimated 10% waste under present irrigation methods.

AS A MATTER of fact, I have demonstrated economy of distribution while permitting no waste in fields under many varying conditions of topography. On steep fields I run supply ditches without grade, like terraces, on the slopes distanced apart to be most convenient for corrugation water runs. These terrace ditches are permanent with flat side slopes. The corrugations row-distances apart extend between terrace ditches.

The water is dropped from one level to the other through the corrugations between the irrigated rows. The terrace ditches distribute the water to the corrugations over tufts of sod used as headgates for diversion. Blue-grass sod is the best diversion gate for equal distribution of small row-flows of irrigation water. Tufts of sod used for water diversion grow and become permanent. This sod distribution appliance is cheaper and better than any other diversion appliance known to me.

This terrace example is used here to illustrate my general system of water distribution. If the field is not steep I

would prefer water row runs of about 250 feet between these terrace ditches. If the field is steep or has uneven planes the water run must be determined by topography.

WHEN the terrace supply ditches are once "set" the sodded diversions automatically control the waste water. The sod "sets" are permanent for one season and practically so from one season to the next. Water turned in the higher terrace and redistributed in succeeding terraces to the row corrugations is automatically regulated in quantity at every terrace ditch to meet the demands of every row corrugation below. One man can efficiently attend 10-acre fields with appropriate water heads during the time required to irrigate such fields, unless the field grades are very irregular, and the row runs are necessarily very short.

To save time and water I provide a distribution trench at the border of the field to dam any water that might waste from neglect. From this foot terrace I make every corrugation a ditch in which the would-be waste water may back up in all trenches which are not supplied with water of equal amount from above. The higher sections of the field, while requiring regulation, may be evenly irrigated before the water is shifted to the next lower section. Any excess of water in different corrugations will be taken up by the next lower terrace for redistribution, but the flow is readily made practically even in all corrugations by timely regulation at the point of the row diversion.

WHEN the distribution of water is effectively under control the cost of irrigation of fields of uneven grade is not greatly excessive. It is more expensive to install an automatic system of distribution for rough fields than for smooth fields, but the cost of irrigation is not great in any common case.

To make this effort more comprehensive I might describe my system of distribution as a system of terraces whether the field is level or steep. The water is run through corrugations in short runs and redistributed to a lower corrugated section of the field. From one terrace the water is dropped to the other in small streams, so small that even the cultivated soil will not be "washed." This flow should be regulated according to grade. When the rows have all been evenly irrigated in one section of the field the water will be dropped to the next lower terrace ditch, by a supply ditch, but not through the corrugations.

Such a distribution system may be cheaply constructed by ordinary plows and corrugators, and no technical labor is required.

HYDRAULIC ENGINEERING

Dealing with the Practical Problems of the Operating and the Consulting Engineer

A DISCUSSION OF PERMISSIBLE CANAL VELOCITIES

By SAMUEL FORTIER and FRED C. SCOBEY

THIS ARTICLE is an abstract, prepared by the authors at the request of MODERN IRRIGATION, *of their paper which constituted the final report of the Special Committee on Irrigation Hydraulics of the American Society of Civil Engineers, on the subject of permissible canal velocities, and which was published in the Proceedings of the Society. Both of the authors are known to irrigationists for their constructive work in the Division of Agricultural Engineering of the U. S. Department of Agriculture. Dr. Fortier was for eighteen years Chief of Irrigation Investigations under this division, and both are now stationed at the Berkeley, California, office of the Division.*

IN THIS paper, limiting velocity is taken to mean the maximum permissible value of the mean velocity. Although it is obvious that for any water prism the highest velocities are much in excess of the mean velocity, yet the only figure sufficiently tangible, under all conditions, for design and operation, is the mean velocity.

Silt is not considered as a specific gradation in soil sizes, but as a general term for all material brought into a canal by "muddy" waters. It is usually thought of, even in this sense, as different from sands and gravels. In other words, the "bottom load" is not included in the term as herein used.

The subject of limiting velocities for open channels has usually been treated under a heading combining the silting and scouring of channels. It has been considered that for each depth of water there is a certain velocity below which silt will be deposited and above which silt will be eroded from the bed of the channel. In the opinion of the writers, two phenomena only slightly related are thus confused. The power of flowing water to maintain a movement of separate soil, sand, or gravel particles, has been confused with the power to break the bedding of a canal bottom and ravel off particles of that bed and transport them to places of lesser velocities where they may be deposited. In their opinion there is no sharp line of demarcation between the velocities that can no longer maintain silt in movement and those that will scour a canal bed. It is believed that there is a broad belt of velocities within which silt already loosened or brought in through a head-gate will remain in suspension while the bed nevertheless will remain undisturbed as regards scour. It is easy to show the absurdity of accepting the laws of silting as giving the immediate answer to the laws of scour.

Certain of the canals of India, served by heavily silt-laden streams, were known to have reached a condition of permanent channel regime, neither silting nor scouring. In 1895, R. G. Kennedy offered his well-known formula:*

$$V_o = Cd^{0.64}$$

in which, Vo represents the "critical" mean velocity in feet per second, of a water prism, d ft. in depth, and C is a co-efficient. This so-called critical velocity is that for which there was no silting or scouring of the channel. The value of C is usually quoted as 0.84, but this coefficient was applicable for fine sand silt only; other coefficients for heavier materials range up to 1.09 for coarse silt or detritus from hard soils. Using the coefficient, 0.84, Table 1 may be developed.

A GLANCE at Table 1 shows the fallacy of accepting these velocities as the lower limit of scouring velocities. Mean velocities of 2½ to 3 ft. per sec. for general conditions are considered as most desirable in irrigation canals of the United States, yet Table 1 would indicate that a canal, 6 ft. deep, is the shallowest which would not show scour at the desirable velocities mentioned in the table.

Additional evidence against confusing the movement of particles by flowing water with the scouring action of that same water is contained in the following: The finer the soil particles, the slower may be the velocities that will maintain the particles in suspension. In practice it is found, that canal beds in stiff clays, classed by soil experts as being composed of particles of 0.005 mm., or less, in diameter, will withstand mean velocities approximating 4 ft. per sec., yet clear sand coarser than granulated sugar will be scoured at velocities of about one-half that, or 2 feet per second.

Some alluvial silts or loams will erode quite easily, when a canal is new, whereas some, of apparently the same size gradation, will not. The difference lies mostly in the presence or absence of effective colloidal matter Colloids, as applied to soils, give the properties of plasticity, cohesion, toughness when wet, and hardness when dry, that are essential to an erosion-resisting soil.

The presence in the water of an electrolyte, such as calcium or carbon dioxide, will flocculate the colloids and partly or completely annul the property of creating cohesion. Therefore, effective colloids are those free from the influence of an electrolyte.

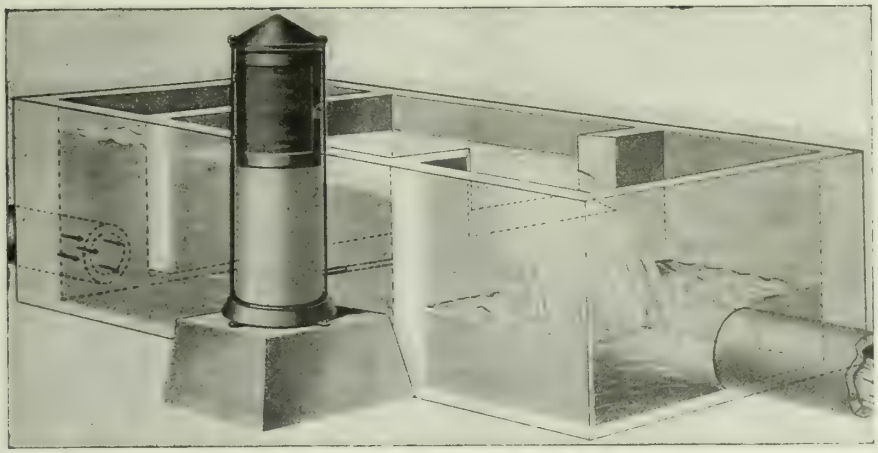
THE property of a canal bottom to withstand scour is due to beds of different types, of which the following are examples:

1—Very fine silty or clayey particles so puddled together that there is distinct cohesion present; a homogeneous mass—the more colloidal matter present, the greater will be the cohesion.

2—Graded materials, the finer filling the voids of the coarser; ranging from the finest of silts to coarse gravel. Such a bed becomes very firmly compacted and will withstand velocities that would erode a bedding composed of any of the constituent particles alone.

3—Non-cohesive particles, without grading as to sizes. The unit particles may be of "sugar" sand or of cobblestone size; if free from colloidal silt or graded sizes a canal bed in such material may come nearest to following what Gilbert terms the laws of "competent velocities."

* Minutes of proceedings, Inst. C. E., Vol. CXIX (1895).



A PERMANENT RECORD OF YOUR WATER FLOW

The Sparling Recording Water Gauge

provides a permanent hour-by-hour graphic record of the flow of water over a weir or through a canal.

Each chart covers a seven day period, showing just what time the water is turned on, the length of time it is on, and the amount of water being used during this period.

Sturdily built of metal throughout and self-contained, many of these gauges built over ten years ago, are still giving faultless service without having cost a cent for repairs.

Priced $75.00 and up

[*depending upon vertical range required*]

TABLE 1

Depths, in feet	1	2	3	4	5	6	7	8	9
Velocity, in feet per second	0.84	1.30	1.70	2.04	2.35	2.64	2.92	3.18	3.43

A study of these types shows that the particular one to which any given canal will belong may or may not be determined by the materials excavated for the canal. It is finally determined only after years of use. Two examples will make this clear.

In the Imperial Valley of California many of the large laterals were excavated in a light sandy soil that would have scoured when the canals were new at a velocity of 2½ ft. per sec. The extremely fine silt particles brought in from the Colorado River prior to 1910 compacted and puddled this sand and plastered it with a coat of slick colloidal mud, so that it would withstand velocities in excess of 5 ft. per sec.; yet the individual particles of this slick mud were so fine that they would remain in suspension at very low velocities, except when the water was "overloaded" with silt—in times of flood on the Colorado River.

Many of the mountain valley canals of the Rocky Mountain States were constructed in loamy gravel soils. The present bottoms of these canals show little indication of loam. At the extreme edges, grass, roots, and low velocities combined have built up vertical banks of fine material, but the bottoms are of well-graded gravel, ranging from pea size to cobblestones, but all so well compacted and fitted together that a high velocity is feasible, far above that which originally washed out all the loam particles until a gravel paving resulted.

THE PROBLEM of plant growth is an important one in the operation of irrigation canals and deserves special treatment.

Few aquatic plants thrive in the absence of sunlight, therefore, canals carrying turbid waters are seldom bothered with plant growth. In clear-water channels some species thrive in velocities much greater than the channel soil will stand. Other species grow only in sluggish velocities. If, therefore, the highest permissible canal velocities as determined from the standpoint of erosion are provided, all that is possible will have been done to prevent trouble by plant growth as far as fixing velocities is concerned.

Thus far in this discussion the writers have endeavored to establish the fact that the determination of eroding velocities is a matter of empirical observation on erosion, not on silt deposition, to the time when a particle is broken off from the bed of the canal, the cohesion due to colloidal matter being overcome or the mechanical interkeying of various elements being disturbed. After that takes place, the data of Dubuat, Kennedy, Gilbert, and others may apply. The actual determination of these empirical data has never been attempted, as far as the writers are aware. That is, it has not been considered feasible to increase slowly the mean velocity in a canal of a definite material and thus determine the actual mean velocity at which scouring commenced.

The only data available are the facts that certain canals have scoured under relatively high velocities. The magnitude of these high velocities is known, but not the exact high velocity that started the scour. Undoubtedly, a higher velocity is required to start scour than to continue it when once started. Likewise, it is known that certain canals do not scour even if the mean velocity is two to three times those velocities suggested by Dubuat or Kennedy. It still remains to be determined how much higher a velocity this particular canal would stand before scour commenced.

Hence, at present, the best knowledge of scouring velocities comes from personal deductions as to the performance of individual canals and not from direct experimental work. With this understanding in mind, the committee submitted questionnaires to a number of irrigation engineers whose experience qualified them to form authoritative estimates of the maximum mean velocities allowable in canals of various materials.

AFTER a careful study of all the data presented and in the absence of experimental data bearing on the subject, the Committee recommends the values given in Table I for maximum permissible mean velocities. The figures given are for canals with long tangents predominating throughout their lengths. For the same canals if sinuous a reduction of about 25 per cent is recommended. Likewise, the figures are for depths of 3 ft. or less. For greater depths a mean velocity greater by 0.5 ft. per sec. may be allowed. The velocity in canals carrying water free from muddy silts, but bringing a powerful abrasive from the river, should be reduced 0.5 feet per sec. Canals from streams more or less silt-laden through the year, may be designed for full-load mean velocities from 1 to 2 ft. per sec. greater than would be permissible for the same material or new excavation, served by clear water from a reservoir. Deep canals conveying water with clean sand will develop destructive sand boils which would be absent in the same canal with clear water from a reservoir. In short, the character of water conveyed must be considered as well as the materials through which the canal is first excavated. In theories of "loading", clear water is best fitted to take on a load of scoured material and a water carrying a partial load of sharp abrasive is better equipped to start erosion.

The general basis of Table 2 is a tabulation of original soil materials in their order of ability to withstand erosion under usual conditions; that is, conveying relatively clear water, for the greater part of the season. In soil gradations finer than gravels, it is recognized that the resistance to erosion depends on the cohesion of individual particles, one for another. For the gravels—fine, coarse, and cobbles—the resistance is by virtue of weight and shape aided by the obstruction afforded one unit by its mixture with others. There is no element of cohesion due to plasticity, or stickiness, such as is found in clay. In graded materials, the canal bottoms become firmly bedded after a few years. At first, there being little plastic colloidal matter, the finer grained soils are washed free and carried farther down stream, to be de-

TABLE 2—PERMISSIBLE CANAL VELOCITIES

Original material excavated for canal. (1)	Velocity, in Feet per Second, after Aging, of Canals Carrying: Clear water no detritus (2)	Water bearing colloidal silts (3)	Water bearing non-colloidal silts, sands, gravels or rock fragments (4)
Fine sand (non-colloidal)	1.50	2.50	1.50
Sandy loam (" ")	1.75	2.50	2.00
Fine loam (" ")	2.00	3.00	2.00
Alluvial silts when non-colloidal	2.00	3.50	2.00
Ordinary firm loam	2.50	3.50	2.25
Volcanic Ash	2.50	3.50	2.00
Fine gravel	2.50	5.00	3.75
Stiff clay (very colloidal)	3.75	5.00	3.00
Graded, loam to cobbles, when non-colloidal	3.75	5.00	5.00
Alluvial silts when colloidal	3.75	5.00	3.00
Graded silt to cobbles, when colloidal	4.00	5.50	5.00
Coarse gravel (non-colloidal)	4.00	6.00	6.50
Cobbles and shingles	5.00	5.50	6.50
Shales and hard-pans	6.00	6.00	5.00

posited on the inside of curves or precipitated where velocities are reduced above check structures. At the same time, the gravel is moving slowly down stream, until finally a bed is developed in which voids are filled by smaller material. This graded bed is quite stable, entirely because of mechanical intermixture and not because of plastic cohesion, although as indicated in Column (3), the fact is recognized that the admixture of effective colloids will make the bed all the more tough and tenacious, increasing its resistance to erosion. The shales are taken as smooth, soft rock, resistant to erosion by clear water, but not so resistant when a sharp abrasive is carried by this water.

FOR EACH grade of original material shown in Column (1) the fact is recognized in Column (2) that the final condition of a canal bed must be quite largely determined by the material through which it flows and likewise the fact that there is little or no abrasive in the water. The figures in Column (3) recognize that the water contains effective colloidal silts. These silts will settle to greater or less extent under relatively high velocities. The difference between colloids and colloidal silts should be noted. The first will remain in suspension, even if all velocity be eliminated, for a long period of time, even years. The silts will precipitate under reduced velocities, and possess sufficient colloidal matter to form a plastic, highly cohesive mass. Obviously, such water will have a marked influence on the final character of the canal bed for all gradations up to the shales where the original material is more resistant than any deposit of silts. In Column (4), the figures indicate that waters conveying abrasive sand or gravel will make some materials more resistant by furnishing the constituents needed for a graded bedding. On the other hand, shales or slick tough clays are themselves resistant, and this resistance is reduced when a powerful abrasive is contained in the water.

Conclusions

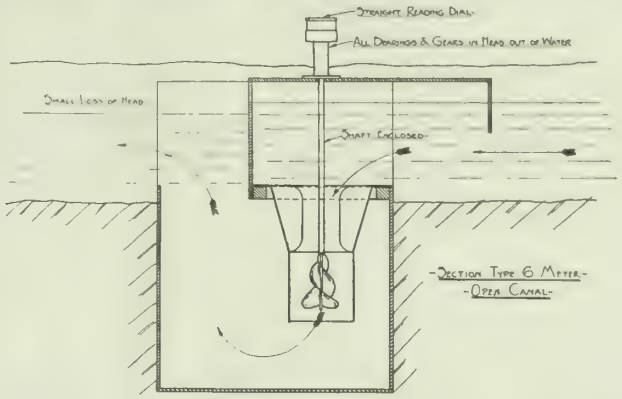
1—The laws of hydraulics governing the movement of loose silt and detritus in open channels are only distantly related to the laws governing the scouring of a canal bed and are not directly applicable.

2—The material of seasoned canal beds is composed of particles of different sizes and when the interstices of the larger are filled by the smaller, the mass becomes more dense, stable, and less subject to the erosive action of water.

3—The velocity required to ravel and scour a well bedded canal in any ma-

(Continued on Page 43)

THE **RELIANCE** METER

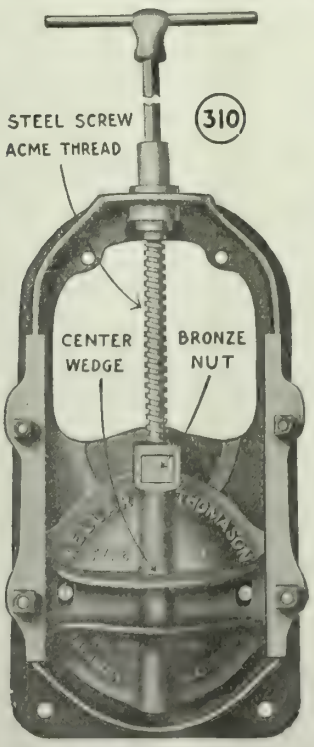


Straight Reading Dial
All Bearings & Gears in Head out of Water
Small Loss of Head
Shaft Enclosed
Section Type 6 Meter
Open Canal

THE RELIANCE IRRIGATION METER has been the standard low pressure Meter for 10 years—thousands installed throughout the irrigated sections of the West. Built in various types and sizes to fit all deliveries on canal and pipe systems. Easy to install—easy to read. Straight reading cubic foot or acre foot dials. Simple in construction, few and slow moving parts—upkeep negligible. No bearings or gears under water—small loss of head. Unaffected by dirt and floating debris in water. There is a size and type to settle your measurement problem.

For full information and prices write—

RANDALL CONTROL & HYDROMETRIC CORP.
1014 E. Ninth St., Los Angeles, Calif.



We manufacture the original line of Irrigation Appliances, Outlet Valves and Cut-off Gates for the definite division of water over the field from Concrete Pipe Lines.

The **Martin Screw Lift**
Center Wedge Pressure Gate
(Type W)

The Original Screw Lift Gate

The Martin has been successfully serving Irrigators, Water Companies and Irrigation Districts for the past twelve years. The design and construction of the Type W insures the very highest degree of service. The center Wedge directs the force of the Screw to center of Slide, applying pressure evenly over the whole seat. Non-rising stem and Crowned slide gives maximum of strength and rigidity. Accurate machining of faces makes gaskets or packing unnecessary. Square threaded, machine cut, COLD ROLLED STEEL Screw working in Bronze Nut gives quick action, prevents rust and consequently binding.

Proof of Efficiency!

Names of satisfied owners gladly furnished on request. Thousands in daily operation both in Concrete Structures and Open Ditch Systems, throughout California, Arizona and Nevada.

WITH THE WATER COMPANIES

Of Interest Expressly to Water Works Engineers, Superintendents and General Managers

WATER WORKS MEN ENJOY CONVENTION AT SANTA CRUZ

SAN DIEGO will be the meeting place of the 1926 convention of the California Section of the American Water Works Association, it was decided by that organization at its sixth annual convention, held in Santa Cruz during October. The section accepted the cordial invitation from San Diego as presented by A. P. Lovell, superintendent of the San Diego Water Department.

The convention next year will have to be a record-breaker in every way, however, it was agreed by the water works men, if it is to excell the 1925 session. An attendance of 247 interested delegates, coming from all parts of the state, combined with an excellent program of practical papers and delightful entertainment, made the recent convention a most successful gathering from every viewpoint.

NEW OFFICERS elected for the coming year were:

Chairman: C. B. Jackson, superintendent, Fresno City Water Corporation, Fresno. Mr. Jackson was vice-chairman in 1925 and has been active in the affairs of the Section. He succeeds as head of the organization George W. Pracey, superintendent of the Spring Valley Water Company, San Francisco, who retires from the official board of the Section after six years of service.

Vice-chairman: S. B. Morris, superintendent and chief engineer, Water Department, Pasadena. Mr. Morris becomes vice-chairman after three years of efficient service as secretary, in which capacity he was largely responsible for the helpful and well-balanced program of technical papers delivered at Santa Cruz.

Secretary-treasurer: Paul E. Magestadt, designing engineer, East Bay Water Company, Oakland.

Members of Executive Committee: John Burt, manager, Marin Municipal Water District, San Rafael; and P. Diederich, superintendent, Department of Public Service, Glendale. Both of these members were re-elected to their positions on the executive committee.

A feature of the convention was the presentation *"in absentia"*, of the Nicholas S. Hill cup, an annual award offered by a former president of the American Water Works Association to that regional section which has shown, during the year, the greatest growth in membership. Fred M. Randlett, National Director of the American Water Works Association, attended the convention for the purpose of presenting this trophy to the California Section, but the cup had been mysteriously mislaid in transit, and when every effort to locate it failed, Mr. Randlett made a graceful presentation speech, congratulating the Section upon its growth, and urging the organization to still further expansion, and awarding the cup as a recognition of the 1925 record—although no cup was at hand.

The report of the secretary revealed the growth recorded during the year upon the basis of which the cup was awarded. Twenty-eight members were added to the Section, of which twenty-two were active, two corporate, and four associate members, bringing the total membership of the organization to 125.

In the course of his remarks Mr. Randlett told the delegates of the activities of the national organization and made special reference to the new publication of the Association, a volume of value to all water-works men, entitled "Manual of Water Works Practice".

THE OPENING day of the convention was devoted largely to preliminary speeches and reports, followed by an informal dinner in the evening. The morning session was a general get-together of delegates, devoted to registration and an inspection of the exhibits which had been prepared by the associate members of the organization. At the afternoon business session, Arnold Williams, city engineer of Santa Cruz, the hostess city, delivered a paper on "Recent Improvements in the Santa Cruz Water System," which was followed by two symposium discussions on "Service Installation Methods and Standards" and "Meter Maintenance Records". The first of these discussions was opened by A. P. Lovell, superintendent of water, San Diego; and the second by G. E. Sedgwick, district manager of the Pacific Gas & Electric Company at Dixon, California.

In these discussions and in all the symposia included on the program one very noticeable feature was the freedom with which the delegates participated in informal and extemporaneous discussion, exchanging experiences and comparing notes without restraint. A factor contributing to this desirable spirit was the free-and-easy manner of the presiding officer, President George W. Pracy, whose native wit and platform ability put every delegate at ease.

THE SECOND day of the convention was "strictly business". One of the most instructive papers of the day was that of I. E. Flaa, chief draughtsman of the Spring Valley Water Company, San Francisco, on "Design and Construction of Concrete-Lined Distribution Reservoirs." This paper was followed by a treatment of "Design of Balancing Reservoirs and Stand-Pipes for Flat Cities and Communities," by E. K. Barnum, engineer, Fresno City Water Corporation. S. B. Morris, superintendent and chief engineer of the Pasadena Water Department, read a paper on "Seismic Activity in Santa Barbara", prepared by V. E. Trace, superintendent of the Santa Barbara Water Department. The morning session was concluded by a symposium led by J. I. Prugh, superintendent of distribution of the Sacramento Water Department, and participated in by fifteen other members.

The afternoon session included the following papers: "Relation of Railroad Commission to the Water Works Man", by W. R. MacKall, hydraulic engineer, California State Railroad Commission; "Co-operation Between Water Works and Fire Departments in Decreasing Losses," by Thomas Baird, chief engineer Fresno Fire Department; and "Adjustments", by Frank F. Clark, chief adjuster, Spring Valley Water

Company, San Francisco. Four short papers were read in concluding the meeting, as follows:

"Methods used in moving 36-inch Riveted Steel Water Main," Judy I. Prugh, superintendent of distribution, Sacramento Water Department; "Relation of Water Pressures, Service Sizes and Interior Fixtures to Complaints of Inadequate Water Service," V. E. Perry, assistant manager of water sales, Spring Valley Water Company, San Francisco; "Methods of Protecting Services and Meters during Street Grading and Paving Operations," P. Diederich, superintendent Public Service, Glendale; and "Use of Mechanical Equipment in Trenching, Backfilling and Pipe Laying", by Thomas Brooks, assistant superintendent of the Bureau of Water Works and Supply, Los Angeles.

On Friday evening the members of the section and their guests were entertained by the exhibitors at an informal dinner-dance at the Hotel Casa Del Rey, convention headquarters. On Saturday, the Chamber of Commerce and city of Santa Cruz conveyed the delegates and their guests on a motor trip through the city, where a new water distribution reservoir was inspected, and along the famous Cliff Drive. Luncheon was served at the Country Club at Aptos. In the afternoon the drive was completed via the Big Trees, stopping en route to inspect the pressure filter and pumping plant of Santa Cruz.

San Diego Approves Purchase of San Dieguito System

A bond issue for the purchase of the San Dieguito water system was approved at the polls by the voters of San Diego, California, almost unanimously during October. The vote recorded at the election was 11,711 in favor of the proposition to 997 against it. The bond issue authorized by this election will consist of $500,000, constituting the initial payment on the San Dieguito system, which will cost the city a total of $3,750,000

By the deal the city will take over the Lake Hodges system, another dam site above Lake Hodges, water bearing land in San Pasqual valley and the Sutherland damsite. The developed properties are to give the city a net safe yield of from 12,000,000 to 15,000,000 gallons a day.

It is planned that the city will take over the system on Dec. 1, and thereafter will receipt for moneys for water sold ranchers and other consumers not in the city. The city also will save $3,000 a month that is being paid the company for water served La Jolla and the bay shore communities from the Lake Hodges system.

Honolulu to Issue Million Dollars in Bonds for Water

The issuance of bonds to the amount of $1,000,000 by the city and county of Honolulu, Hawaii, has been authorized by President Coolidge on the recommendation of Secretary Work.

Proceeds from the sale of the bonds are to be used in the improvement of the water supply and sewage system of the city and county. The outstanding indebtedness of the city and county is $2,080,000 and this amount together with the proposed issue of $1,000,000, aggregating $3,080,000, is within the maximum legal limit of indebtedness, which is $6,420,000. Records show that the real and personal property of the city and county of Honolulu as assessed is the sum of $214,275,164.

Fresno Fair Shows How It Can Be Done

(Continued from Page 19)

Leaders of the irrigation equipment industry have repeatedly called attention to the fact that the displays afforded at Sacramento are not commensurate with the primal importance of irrigation to the entire state.

Those who have attempted to secure better exhibit facilities for irrigation at the Sacramento Fair have pointed out that agriculture is the fundamental basis of the organization, and behind practicaly all agriculture in California is irrigation; and that, in spite of steadily increasing expenditures for horse-show pavilions, grandstands and similar needs, the irrigation display—such as it is—continues to be housed in a tent, far removed from the center of things, with no adequate plans or facilities for a representative exhibit.

Manufacturers and dealers are hopeful that the success achieved by the Fresno fair in giving irrigation a "square shake" may inspire the management of the State Fair in California to provide for an irrigation display on a larger scale and to appropriate the necessary funds for the construction of a pit and other necessary facilities.

Fresno has led the way for bigger and better irrigation exhibits in every state, county or district fair in the entire west.

This Month's Cover

The picture appearing on the cover of this month's issue of MODERN IRRIGATION shows a crew of workmen engaged in laying a thirty-six inch riveted steel siphon on the Vista Irrigation District, California. Construction activities in this district are described in detail in an article beginning on Page 13.

WHO'S *WHO* AND WHO'S *WHERE*

IN IRRIGATION AND RECLAMATION

Personal Notes and Impersonal Observations About Men You Know

S. L. Rothery, office engineer for the Imperial Irrigation district, has resigned his position and on November 1 became associated with Vaughn Wood in private engineering practice in Los Angeles.

Andrew Weiss, assistant director of reclamation economics, and W. W. Johnson, have completed a survey of the irrigable lands of Jefferson County, Oregon, and have rendered their report to the commissioners of the County.

W. R. Elliott, consulting engineer of the Gila Valley (Arizona) Irrigation District, was in Safford, Arizona, early in October, for a conference with irrigationists of that section on the proposed construction of a storage dam for the Safford valley.

Arthur S. Bent, prominent construction engineer and contractor, recently resigned his post as a member of the Board of Education of his home city, Los Angeles, after two years service. He is succeeded by Clair L. Peck, also a construction engineer.

L. M. Holt, of Yakima, Washington, superintendent of the Indian Irrigation Service in that district, recently made a ten day trip of inspection over the projects under his jurisdiction. Good crops and generally favorable conditions were reported on all of the projects which he visited.

T. O. Walton, director of the Texas agricultural extension service, has been made president of the Agricultural and Mechanical College of Texas and is succeeded as extension director by Charles H. Alvord. Mr. Walton has been connected with extension activities in Texas since 1909 and was director of the service, comprising some 330 workers, from July 1, 1921.

Several Southern Pacific officials, including Guy Shoup, general counsel; Sam Andrews, land appraiser and B. A. McAllister, commissioner for the Southern Pacific Land Company, were in the Imperial Valley during October for conferences with directors of the Imperial Irrigation District on problems connected with the Mexican lands of the district.

Professor Frank Adams, of the University of California, will be in charge of the program devoted to water conservation and flood control at the Seattle meeting of the western division of the Chamber of Commerce of the United States, to be held December 7 and 8. Prof. Adams is head of the department of irrigation investigations and practice at the state university.

George Curry, international boundary commissioner for the United States, recently visited the Rio Grande Valley to co-operate with officials of the San Benito Water District in making a survey of the Rio Grande River from Roma to the mouth. An army flier has been assigned to the survey to assist in giving accurate information which will assist the district in planning for flood control and irrigation.

A committee of irrigationists from Pasco, Washington, representing the Pasco Chamber of Commerce, recently carried to Erle J. Barnes, State Commissioner of Conservation and Development, at White Bluffs, their plea for immediate consideration of an engineering report on the proposed development of the Snake River for irrigation. The committee included F. L. Perry, C. F. Stimson, H. P. Vermilye and E. J. Raynolds.

Robert B. Van Horn, formerly maintenance engineer on the Tieton division, Yakima project, recently resigned to accept a position as instructor in the engineering department of the University of Washington. His place on the project has been filled by the transfer from the storage division of Tom C. Mead. H. Ellis Sealing, senior draftsman, who has been engaged on the topographic surveys on the Kittitas division, has beeen transferred to Yakima to fill Mr. Mead's place.

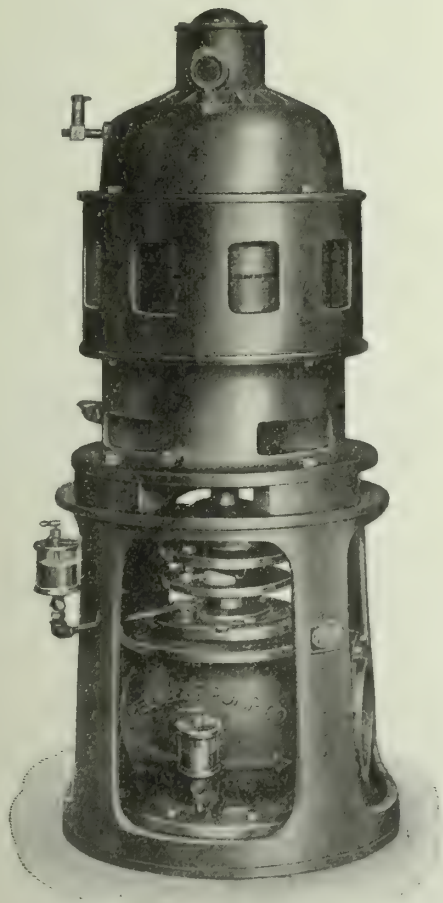
Joe E. King, district manager of the Southern Sierras Power Company, addressed the Imperial Valley Farm Lands Conference at El Centro early in November. The subject of his remarks was: "The Part Hydroelectric Interests Play in the Development of Farm Real Estate." He pointed out that every fourth ranch home in California has an electrical distribution system, and indicated that it is electricity that is largely responsible for holding up agricultural production in the face of a constantly decreasing farm population.

W. L. Powers, of the Oregon Experiment Station, Charles P. Shaw of the California Experiment Station, and Macy H. Lapham of the United States Department of Agriculture, have recently completed a study of the lower Klamath Lake region of southern Oregon and northern California. The report was not especially favorable, and mentioned several important drawbacks existing in this region, including much peat land, some concentrations of black alkali, and the tendency of crops to exhaust quickly the plant food in the soil.

Professor Charles H. West, assistant agricultural economist in the experiment station of the University of California, recently addressed the joint meeting of the Irrigation and Agricultural Sections of the Commonwealth Club of San Francisco on the subject of the condition of agriculture in the irrigated districts of California. Professor West pointed out that the farmer should receive fair prices for his products before irrigated lands should be further expanded. He presented figures showing that the irrigated area of the state had increased from 4,200,000 acres in 1919 to 4,700,000 acres in 1924.

Peerless Performance

The acid test of any piece of machinery comes when it is subjected to continued service and is *thoroughly tried* and *tested* by experienced engineers.



Peerless Pump performance is absolutely guaranteed. We welcome the most thorough investigation of our product *before* it is installed, and the most rigid tests *after* installation, as we want every Peerless Pump to be absolutely satisfactory to its owner.

The following is a partial list of users, who will gladly tell you of the efficiency and performance of Peerless Pumps—ask them!

RECLAMATION

A 1925 REVIEW OF GOVERNMENT RECLAMATION*

THE POLICY of reclaiming arid and semiarid lands by the Federal Government came into existence with the passage of the reclamation act in 1902. To date the Government has spent $200,000,000 on works to irrigate more than 2,000,000 acres of land which support almost a half million people.

It was believed that if the Government built dams and canals agriculture would follow; that settlers would take up the lands and carry out the costly and difficult task of clearing off the sagebrush, leveling the surface, providing farm buildings, implements, and livestock, and doing all those things that are necessary to change the desert into productive farms.

The Government made generous terms for the repayment of the cost of the works. The settlers were to pay annually the cost of operating and maintaining the dams and canals. The cost of construction was to be repaid to the Government at first in 10 annual installments, which was later increased to 20 annual installments. These liberal terms of payment for a water right—20 years without interest—made this domain a fruitful field for the land speculator and the result was a rapid and disastrous inflation of prices on land in private ownership.

MORE than two-thirds of the lands under works constructed by the government were privately owned when construction started. The political prestates frequently determined the location of many of the projects. As a result canals were built to water unfit land and where the cost of development was more than agriculture could stand. A survey recently conducted by a fact-finding committee on Federal reclamation showed that an amount estimated at $26,000,000 had been expended for the irrigation of worthless and unfertile lands, much of which had been abandoned by settlers.

Designed as a home-making institution, Federal reclamation as carried out in the past has been defective. There was no selection of settlers based on experience and qualification, and the opinion prevailed that the reclamation act did not permit the employment of people to give practical advice on the preparation of the land for cultivation or instruct the beginner, to whom conditions were new, as to what crops to plant and when to plant them. The Reclamation Service was primarily a construction agency with the social and human requirements omitted from its administration.

The consequence was that some of the land was acquired by people who had never been farmers and never expected to be, while the real farmer, who took his family into this new domain with his money and experience, had a faith and confidence in the Government that it would not have spent immense sums to build these irrigation works unless it was to create conditions under which he could make a living.

SETTLERS who entered on these projects under the impression that they were obtaining a farm practically free of cost found that it cost thousands of dollars to do the preparatory work. Lacking the capital themselves, there was no credit agency from which they could obtain money on terms suited to the undertaking. They could only borrow on short-time payments and at high interest rates. Eight and twelve per cent is being paid on many projects for money borrowed to level the land, build homes, and buy implements and livestock.

When he tried and failed, the settler's faith in our institutions was weakened, and a succession of such failures has eliminated blame from the individual and fastened it onto the system or conditions under which he attempted to create a home. Instead of being the open door to farm ownership, many of these Government projects have been the scene of heart-breaking experiences to settlers and their families, leading to failure and loss of their land and lifetime savings. There are at the present time 6,000 unoccupied farms of varying size on Government projects.

The financial difficulties of irrigation farmers led to a practice of not paying the Government for the service it rendered in providing water, because postponement of that payment did not increase the debt, which bore no interest. Congress was also appealed to repeatedly and laws were passed authorizing deferred payments or giving blanket relief to all water users on a project. Under these moratoriums delinquent payments on operation and maintenance were added to construction costs. These measures gave no permanent relief to the struggling settler who had met his payments. They often did enable the well-to-do landowner to avoid making his payments.

THE SURVEY of the fact finders showed that only one of the projects had met its obligations as they fell due, and in addition to the failure to pay construction costs about 33 1-3 per cent, or approximately $5,688,000, of operation and maintenance costs, payable annually, remained unpaid, including $1,060,000 current costs not yet assessed against the water users and $1,194,000 operation and maintenance charges to be repaid as construction.

Two years ago a program was inaugurated for the reconstruction of the Federal reclamation policy. A change in the law was enacted by Congress a year ago to provide for a different method of repayment of construction charges to the Government. Instead of paying an arbitrary amount annually based on 20-year installments regardless of the productivity of the irrigation farms, provision is made for payments of a percentage of the gross value of the crops produced. The percentage was fixed at 5 per cent of a 10-year average. The question of eliminating from the

CONSIDER. A machine moving practically a continuous flow of dirt. A continuous line of digging, shaving, cutting buckets; filling and ejecting twenty-two buckets a minute of dry earth, adobe or clay. In water, taking with every cut, small willows, tules, water grass and all other small growths, along with a clean, shaving of the bank.

Each bucket filling and emptying clean, one-ninth of a cubic yard of dirt, every time around. In an average day, under average conditions, the Ruth cleans out 1,500 cubic yards of canal earth, leaving a clean cut, smooth faced bank. The capitulation below gives more detailed costs and capacities.

Truly, we claim that with the Ruth bucket and its Ruth Ejector, the Ruth Super Crawler Dredger is the only machine of its kind today, in its particular field of irrigation, reclamation and drainage ditching.

Why dig a ditch, then let it grow up with weeds, when the Ruth will keep it clean and in better shape than when new, at such a low cost?

Write us fully today of your irrigation, reclamation or drainage problems. We will help you.

Tell Us

How many miles of canals in operation or to be constructed?

Is it irrigation or drainage?

How many acres reclaimed or to be reclaimed?

In dry earth—in running water—at any slope, The Ruth automatically digs and cleans smooth even ditches.

projects the immense areas of land unfit for cultivation was met through the classification of the soils on all the projects. This has not yet been completed, but recommendations are to be presented to Congress for reducing the size of projects containing infertile lands and allowing settlers occupying worthless farms to exchange them for productive ones. Most of the projects are now being operated by the Government, but the new reclamation law provides that the farmers through their own water users' association or irrigation districts may take over the operation of the projects.

THE ESSENTIAL part of the Federal reclamation policy of the future is a program of land settlement and farm development. Unless settlers can be attracted to the projects and are able to remain on them, there is no reason for building them, and the Government will not be reimbursed for their costs. The Government can construct irrigation projects, but it can not draft settlers. One solution of the settlement problem is cooperation between the Federal Government and the States in which projects are located, the States to assume the responsibility of settlement. In authorizing appropriations for the construction of several new projects and additions to old projects last year Congress inserted a provision in the law for the first time stipulating that the States shall settle them.

Any new settlement policy must be based on the selection of settlers who have had experience in farming and who have sufficient capital to underwrite advances made by the Government. Financial aid to settlers at a low rate of interest for the clearing of the land, improvement of the farms, and purchase of necessary equipment is also paramount to success. Until these problems of land settlement and farm development of the old projects can be solved the consensus of opinion is that the construction of new works should be deferred. The first intention of reclamation was to build homes. Ownership of homes by the settlers on the old projects should be assured before new projects involving the expenditure of additional millions are attempted. Securing settlers is of all reclamation problems the most difficult.

Protecting Our Irrigated Lands From Alkali

(Continued from Page 15)

To apply the exact amount of water necessary to meet the needs of crops without some passing below the zone of plant growth and being wasted is impractical if not impossible. Even to approach this ideal practice in irrigation requires a knowledge of the depth of root systems of plants and also the water holding capacities of different soils. These are all factors which may vary greatly, even within a small area. The result is that more water is applied, ordinarily, than is necessary to meet actual crop needs.

The history of irrigation throughout the arid west is that large quantities of water are wasted into the soil. On practically every large area that has been under irrigation for any considerable time, the water table has risen sufficiently to threaten the irrigability of the soils. On most of them portions of the lands have been rendered unfit for cultivation, through excess water and alkali accumulations, until drained and protected by artificial means. On many small areas, where natural drainage conditions are exceptionally favorable, artificial works are not necessary. In a few localities where natural surface supplies have been supplemented by pumping underground water the rise in the water table has thus been prevented. Numerous examples of this sort are to be found in Southern California. In the Salt River Valley of Arizona wells which were sunk primarily for the purpose of lowering the water table and protecting soils from seepage and alkali have served also to supplement the surface water supply during dry periods.

THE CHARACTER of works that have been found necessary to lower and control ground water in irrigated lands varies considerably to suit the local conditions of the area involved. Generally it may be said that such works differ also in some respects from drainage works intended to remove surface waters in humid areas. These differences are due partly to fundamental differences in the soils of humid and of arid regions; but principally to the fact that, in the one case ground waters, and in the other, surface waters, are to be removed.

The removal of ground waters involves consideration of sub-surface or subsoil conditions. The methods employed must be suited to the particular formation to be dealt with, and are subject to considerable variations in different areas. The minimum depth to which ground water must be maintained in order to afford protection against alkali concentrations must be considered. This depends primarily upon the capillary

power of the particular soil, or, in other words, upon the height to which water will be lifted in it by capillary action.

It is gratifying to note that the question of protecting soils through drainage and other irrigation is being regarded more and more as an essential part of irrigation farming. During the past ten years many millions of dollars have been invested in drainage improvements over the irrigated areas of the west.

The financial backers of irrigation enterprises generally realize that protection of soils is necessary in order to make the lands safe security for investments.

Settlers Needed on Newlands Irrigation Project

The Newlands irrigation project, Nevada, of the Bureau of Reclamation, Department of the Interior, was started in 1906, and irrigated agriculture was practiced on the river bottom lands for more than a generation previous, yet only about half the lands are now in crop. Most of the canals and other structures necessary for irrigating all the useable lands have been completed and are ready for use. These investments must be paid for, and to do so it seems highly desirable that every effort be made to attract new settlers to the project.

This conclusion is reached by Charles F. Shaw, Professor of Soil Technology of the University of California, who has completed recently a review of land classification on the Newlands project. The work of classifying the lands was performed by a local cooperative committee of farmers and covered the lands of the Truckee-Carson Irrigation District, an organization of farmers. The lands of the district and of the project are practically the same, except for proposed additions to the project under the Spanish Springs extension.

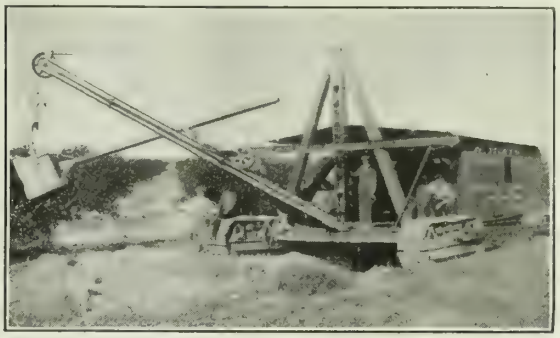
The lands were classified into six classes. Productive lands are in classes 1 to 4, temporarily unproductive lands in class 5, and permanently unproductive lands in class 6. The lands in class 6 comprise 32,313 acres, nearly all of which had been eliminated prior to the classification. The irrigable area, covered by classes 1 to 5, comprise 74,605 acres. Of the irrigable lands within the district only 61,607 acres are now under water-right contracts.

Drainage is naturally poor over much of the district. An extensive drainage system is planned and partly constructed by the Bureau of Reclamation under contract with the district, the latter assuming all responsibility for care and maintenance.

For Cleanout -- Maintenance -- New Ditches

There's a Bay City for Every Job

BAY CITY Land Dredges span the ditch, can dig any desired slope, and dump waste on both banks. BAY CITIES leave clean, wide berms, and can work up or down streams. One trip over the ditch is enough. The Shovel Type Dipper handles hard material in which other types of buckets cannot make a good showing.



At left—One yard BAY CITY Dredge digging and cleaning ditches in Florida Citrus Groves.

BAY CITY Land Dipper Dredges are built to fit the job. Walking, Crawler, Track or Floating mounting. Easily dismantled, transported and assembled. Capacities ½ to 1½ cubic yards. Oil engine or electric operation.

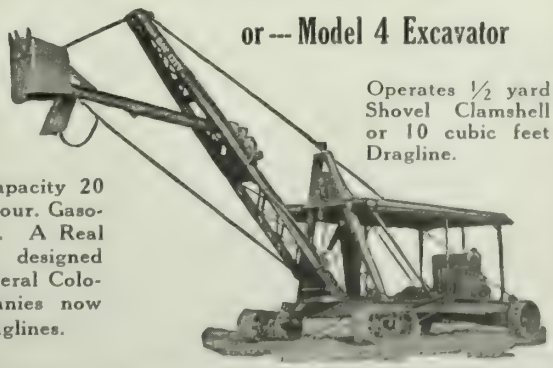
FOR SMALLER DITCHES — OR PIPE LINE TRENCHES

The BAY CITY 16-B convertible Excavator will handle a wide range of work. Operates Dragline, Trench Shovel, Clamshell or Skimmer. All steel. Shipped assembled. Digs any width or depth up to 20 feet.

Model 16-B Trencher—Excavating for Sewer.

or -- Model 4 Excavator

BAY CITY Model 4 is a small low-priced convertible, one-man operated Excavator. Fills the gap between hand labor and high priced equipment. Capacity 20 to 40 cubic yards per hour. Gasoline or electric power. A Real Digger economically designed for the small job. Several Colorado Irrigation companies now operating Model 4 Draglines.



Operates ½ yard Shovel Clamshell or 10 cubic feet Dragline.

Our many years experience in manufacturing and operating Dredging machinery is at your service. Write us about your problem.

IRRIGATION FINANCE

WHAT OREGON NEEDS—AS THE BOND-BUYER SEES IT

By JOHN DWIGHT NEALE*

SOME years ago the state of Wyoming issued about two and one-half million drainage district bonds throughout the Big Horn Basin irrigated area. Depression in agriculture came along and the districts in that region found themselves hard pressed to pay principal and interest on the bonds. The state legislature passed a law providing for the refunding of these securities into low-rate, long-term bonds, and also a law providing for the purchase of such refunded drainage bonds by the state of Wyoming. This has been done in practically all districts, and all parties interested are benefited.

OREGON statesmen have said much about high-interest rates which irrigation districts have had to pay; the large discounts irrigation bonds carried; how great a burden this was to Oregon farmers and how money has been wasted in construction costs. I believe much of this is literally true. I also believe that the means for relief from this situation and the avoidance of its recurrence are within Oregon's grasp.

Oregon has a law authorizing the certification of its irrigation district bonds. She also has a law permitting the state payment of interest on irrigation district bonds for a 5 year period.

She also has an intelligent group of men vitally interested in irrigation development, who have organized the Oregon Irrigation Congress, which feels the urge and necessity of spending three days in annual convention, determining ways and means of furthering the cause of irrigation and increasing the population, wealth and production of Oregon. Oregon's representatives in the Federal Congress have been outstanding advocates of irrigation development in the west, in general and in Oregon in particular.

Irrigation districts have organized and issued bonds in the amount of about $13,000,000. All of these things, therefore, lead me to believe that Oregon is interested in irrigating her arid land, in enlarging and conserving the credit of her irrigation securities and in placing Oregon in a position to care for her full share of new immigration and Pacific Basin commerce and trade.

GRANTING that these things are true, therefore, why not clinch the nail on the other side? Why not *settle* the land within the irrigation districts for which water is now available?

Why not forget that the western one-third of Oregon needs less irrigation than the eastern two-thirds, and instead of making of irrigation a political or sectional question make of it a state wide subject of deepest interest, of equal importance with state highways, educational institutions and all other major state policies?

Oregon must make some arrangement for settling her lands, for which water is now available.

She cannot today readily sell new irrigation district bonds. I know of three Oregon irrigation districts which now have bonds for sale and for which Oregon or California bond dealers will make no reasonable offer.

Why bid on new issues when blocks of bonds of those districts which have their systems all completed are floating around in the open market and offered almost daily at prices below that which the districts received for them? Investors and bond dealers think something has happened to Oregon irrigation district bonds. What is the result?

BOND dealers buy bonds to sell—not to keep. They cannot stay in business and buy what they cannot sell. It will be considerable time before Oregon can enter the money market and sell her irrigation district bonds readily. This will be a good thing for those districts already created and with land available for settlement, provided Oregon business men, bankers, chambers of commerce and this Congress get down to the business of settlement of lands already available under completed systems.

Settlement of these lands will weed out the unfit and the large land owner, and will encourage the farmer who has been striving to use well his land and water. For the next five years, at least, Oregon's irrigation work is one of settlement—not the creation of new districts nor obtaining of appropriations from the U. S. R. S.

Oregon can make her irrigation district credit worth 100 cents on the dollar by keeping her irrigation management out of politics and by formulating a definite land settlement and land development policy, just as she has of her state highways and harbors.

She can save her own credit, and her farmers millions of dollars in interest, by providing immediate legislation for refunding all her outstanding irrigation district bonds and by issuing, in lieu thereof, state bonds bearing 3½ or 4 per cent interest instead of 6 per cent.

She can discourage and hold in check local communities desirous of bringing new irrigation districts into existence until those already created and having outstanding certified irrigation district bonds are settled and made a definite asset to the state.

She can establish a central state agency for the listing of all land within existing irrigation districts which is for sale, or which can be acquired from the districts for taxes, and thus have available a central clearing house for disposing of all such land to homeseekers. Such a plan would co-ordinate and correllate state wide interests and action in the matter of land settlement within irrigated areas. Willamette Valley itself would produce twice as much, on the average, if it had three four-inch irrigations in the height of the growing season, during the usual period of summer drought. Thus, a statewide interest—

* This article is taken from a paper delivered by the author before the fifteenth annual meeting of the Oregon Irrigation Congress.

a Willamette Valley interest, if you please—could be created in Oregon irrigation.

Another advantage of this plan and program would be the elimination of extravagant statements and representations by land-selling enthusiasts of the various local communities. This central state agency, acting as a clearing house for all irrigated land which is open for settlement, or which may be secured for taxes, would publish all the literature describing the same and this literature would be primarily to state facts rather than sell land in any particular locality.

THIS is a plan for land settlement which is worthy of careful analysis, and which must be followed, in the main, by all western states which have more irrigated land available than present owners can use profitably.

A few years of intelligent application of this plan and principle would settle up all Oregon irrigation districts now created. It would make their bonds worth 100 cents on the dollar. It would place every Oregonian back of irrigation development in Oregon. It would complete the program initiated when reclamation of Oregon's arid and semi-arid lands was commenced, on a large scale, 20 years ago. It would permit the formation of only such irrigation districts as have merit and which could be settled and works built at a cost within economic reason.

As your system now stands, your state engineer and your bond commission are placed in a hard and unreasonable position. They have little real authority about holding back ill-timed or questionable development. They see districts already created with large unsettled and unused areas, yet are asked to approve and certify new districts and their bonds where settlement will be necessary and where construction costs are uncertain.

A definite state-wide program of land settlement must be placed in operation before the credit of Oregon irrigation district bonds is restored and before new issues will sell readily in the open money market.

Notwithstanding Oregon's long past history of fine achievement and development, her highest and best attainments are yet to be realized.

So long as an alert and awakened conscience, on the part of each Oregonian places full value upon the part capital and credit play in developing and rendering useful to millions, your vast natural resources, so long will Oregon continue to take her proper place as one of the great commonwealths of the nation.

Permissible Canal Velocities

(Continued from Page 33)

terial is much greater than the velocity required to maintain movement of particles of that same material before becoming bedded or that have been raveled off by higher velocities than the bed would stand.

4—Colloids in either the material of the canal bed or the water conveyed by it, or in both, tend to cement particles of clay, silt, sand, and gravel in such a way as to resist erosive effects.

5—The grading of material running from fine to coarse coupled with the adhesion between particles brought about by colloids makes possible high mean velocities without any appreciable scouring effect.

6—Irrigation canals may be designed for the velocity that is permissible when seasoned by age, as the demand for water grows with the age of the canal and the maximum mean velocity grows with the supply necessary to satisfy this demand.

7—Power canals are likely to be placed under peak load as soon as feasible after completion. For this reason a more conservative velocity should be chosen, otherwise scour may take place before seasoning.

8—Canals, when new, may be operated with velocities less than the maximum permissible, by the use of check structures.

9—A slight excess of velocity is preferable to insufficient velocity. Check-drop structures will correct a slope causing erosion, but there is no method within reasonable cost by which velocities may be increased.

10—In the past, engineers have been led astray by too close an adherence to the results of experimental data on the transporting action of water on such materials as clay, silt, sand and gravel, considered separately rather than on cohesive or mechanical combinations, and in consequence many canals have been designed and built on too flat slopes with correspondingly low velocities.

11—The growth of aquatic plants is but partially connected with velocities. Canals designed for the highest permissible velocities, from the standpoint of erosion, will be as free from plant growth as design alone can effect.

Execute Bond Sale Contract

Officials of the Palo Verde (California) Irrigation District in October closed final details and executed the contract for the sale of $1,863,000 in bonds issued by the district. The entire first and second issues, totalling $3,500,000, are now being printed in Los Angeles.

A Constructive Program of Irrigation for Oregon

(Continued from Page 16)

sections of the State where development work is most needed;

"That a representative committee be appointed to study, report and make recommendations for the proper use of group credit, settlement, repayment, power development, and related reclamation legislation, to be reported at the next session of the Oregon Reclamation Congress;

"That a study should also be made of possible improvement of the Irrigation District Law;

"That irrigation district directors be urged to employ colonization managers to work in cooperation with the Land Settlement Departments of the Chambers of Commerce for the settlement of all lands in the districts;

"That neither law, constitutional authority, nor appropriation of funds renders possible the assumption of settlement of Federal reclamation projects by the State."

Other resolutions endorsed the work done by the Portland Chamber of Commerce with the Oregon Development Fund, the work done by the Experiment Station on the Relation of Electricity to Agriculture, and disapproved public development of electric power.

Hood River was selected as the place for holding the annual meeting of the Reclamation Congress next year.

A SETTLEMENT program for filling up unoccupied farm units on Oregon projects is being developed by the organization along the following lines: It is proposed to list unimproved or excess holdings for sale within a reasonable time at a price to be fixed by impartial appraisers. Information for prospective settlers should be based on an agricultural economic survey of the project and approved by the experiment station authorities. Only settlers of suitable capital, experience and industry should be considered. Each project should have a colonization manager to work in cooperation with the Land Settlement committees of the Chambers of Commerce in securing and locating settlers. A project agricultural advisor, where the work can not be handled by the county agriculturist, should be provided under the supervision of the Extension Service. Each project should have a revolving fund with which to fit and seed a portion of each vacant tract in perennial meadows such as alfalfa. On new projects excess land should be contracted for sale at a minimum price and any increase in the "going" price of unimproved land within a reasonable time should be divided equally with the districts, to be used in the improvement of idle tracts coming into the ownership of the district.

The general situation of the irrigation farmer in Oregon today is greatly improved. Delegates to the recent Irrigation Congress were driven over projects in the Rogue River Valley, where the value of the crop this year will practically equal the cost of the water rights per acre. The Talent Irrigation District with a bond issue of $1,100,000, will produce this year a crop worth $1,000,000. The value of crops on the Medford Irrigation District will be approximately $2,000,000. On the Grants Pass Irrigation District some small farmers took from $400 to $800 an acre of crops in berries or apples. One harvested 5,400 pounds of snap beans from an acre in time to net 6 cents a pound. One farmer, Charles Brooks, near Grants Pass, took $860 from three-fourths of an acre of strawberries. The gross crop value from irrigation projects in the Rogue River Valley this season will run approximately $5,000,000, or an average gross value per acre amounting to more than half of the cost of the water rights.

Service Installation Standards

(Continued from Page 22)

this method the consumer is given a better supply and the Department has one less pipe to maintain in the street. Also, the domestic service can be enlarged by unscrewing the bushing in this tee.

We have specifications covering curb cocks, galvanized iron street elbows, couplings and elbows from ½ to 2-inch. The reason for this standardization is not alone to insure good composition, galvanizing, weights, etc.; it is also to insure a standard dimension so that when a fitting has to be renewed, the space for the meter remains the same.

A special two-inch bronze angle valve is now being used and takes the place of a regular curbcock on account of the fact that the keys corrode in the bodies of the curb cocks, making it very difficult and precarious at times to operate them. This angle valve has a female thread for riser and a male thread for the meter flange. It takes the place of a street elbow, curb cock and short nipple.

We are now contemplating the use of copper pipe for sewer connections instead of the regular galvanized iron or steel, which corrodes very rapidly in certain soils and conditions.

MODERN Irrigation

Have You a Delegate at This Meeting?

THE COMPETITIVE business world of today moves forward on two wheels. One of these is salesmanship proper and the other—*advertising.* Whether you realize it or not, business amounting to billions is now transacted annually through the advertising pages of magazines and industrial publications. It is *here* that the preliminary skirmish of competition takes place and many a silent victory is won, or nearly won, before the salesman calls.

The advertising pages of MODERN IRRIGATION are a market-place. Here, once each month, is held a sales convention on paper. Here representatives of the leading equipment manufacturers speak their messages to the great market that buys your products.

These "silent salesmen" are an indispensable part of the general campaign; as necessary in their way as is the personal representative who stands between you and your customers, and your prospective customers. Do not, like the fabled ostrich, hide your head in the sand and imagine otherwise. You may, by cultivating such an illusion, go on saving the cost of a monthly advertisement; but if that is your policy you are slowly and certainly losing prestige, business and good will—of a far greater value to you—and making it easy for the more astute competitor, who does not believe in such limitation of armaments, to penetrate your market, overcome advantages which you hold in fancied security, and eventually outflank you on this important sector.

At this moment, the pages of MODERN IRRIGATION are being examined, and examined carefully, by men whose yearly purchases in your line aggregate large sums of money. Long-pull advertising will help you to secure a larger percentage of this annual turn-over. The men who buy are reading and studying these advertisements—never doubt it. Consciously, or unconsciously, they are forming their opinions and narrowing down their ultimate choice of equipment. Many *actual decisions* are made months in advance of the order for the goods. None but the most backward companies in business today are not fully alive to this, while those of seasoned advertising experience are now, as never before, bringing up their advertising artillery for the big year's business ahead.

There will be no disarmament in the business world the coming year—no unpreparedness in the organizations of progressive business concerns. Competition will be keener than ever before. The personal skirmishes and "bouts" of your salesmen and distributors in the field will have their counterpart in the drive for business and prestige through the advertising pages. Laggards and sluggards will drop out, and fall by the wayside. Live, up-and-going companies will go forward on "both wheels."

Think the matter over. The monthly meeting on these pages will go right on, month after month, and the silent but efficient emissaries of the leading companies in your line will be present. Your own advertisement gives you representation according to your merits. Why not decide upon a campaign now, and let us talk the subject over with you?

We'll be glad to introduce your "Silent Delegate" at the next monthly meeting.

OVERHEAD IRRIGATION

OVERHEAD EQUIPMENT MUST BE CAREFULLY SELECTED

By J. P. CAMPBELL*

MODERN growers who are interested in overhead irrigation are also interested in ascertaining what equipment will give them the best results and the largest returns upon their investment. The following is a brief outline of what many years of practical experience has demonstrated to be the most satisfactory.

Hillside irrigation with overhead sprinklers on the Leo V. Youngworth ranch, near Culver City, California. On close inspection the hundreds of sprinklers are visible.

Pipe is the largest item of expense in an overhead system. It is not only subject to dampness in the soil and changes in temperature, but in many cases chemical conditions of the soil tend to make it very short lived unless it is of the best quality and proper precautions are taken to protect it.

In order to obtain the maximum length of service nothing but full weight standard pipe should be used for the underground main and lateral supply pipe and sprinkler stands, in the writer's opinion. Laterals that are too small to be properly dipped both inside and out should be galvanized, but the larger sizes will last as long or longer if properly dipped with hot asphaltum.

Where it is necessary to reduce initial cost of intallation a good heavyweight casing or line pipe, or even riveted pipe can be used for the larger mains. If of good quality and properly protected these materials will give years of good service and, in case of deterioration or damage, can then readily be replaced or repaired, but I regard it as the height of folly to use lightweight high-carbon casing or boiler tubes for laterals and stand pipes. On a properly installed system there usually is more than a thousand feet of lateral pipe to the acre and one may readily imagine the endless annoyance and expense of replacing and repairing when this thin material begins to rust through and leak, which it will probably do after a few months of service.

Pipe used should always be large enough to carry thirty to fifty per cent more water than is necessary properly to operate the sprinklers it supplies. This is necessary on account of the constantly decreasing inside diameter, which condition is much more pronounced on low pressure systems or where water containing certain minerals is used.

As to fittings, when these are obtainable it is preferable to use cast iron instead of light malleable on the underground system. Even black cast iron fittings, painted on the outside last practically a lifetime, I have found. Standard 125-pound brass gate valves should be used for controls on the underground system.

Sprinklers are by far the most important item to be considered in connection with the modern overhead system. They should be simply constructed, long lived, give a uniform distribution in small rain-like drops so that all the water will fall to the ground and "soak in" and not be lost by evaporation. They should also have the smallest possible delivery capacity so as to prevent washing or puddling, this being especially essential on heavy soils and steep hillside installations. After testing practically every sprinkler manufactured including more than fifty experimental devices personally designed, the writer has found the small high-speed type with round delivery openings

Another view of the same ranch. This scene is on top of the hill shown in the upper picture. The trees are young avocados, to which overhead irrigation is particularly applicable.

*Mr. Campbell is president of the J. P. Campbell Irrigation Company, Los Angeles.

We make complete installation if desired

This new Sprinkler will practically last a lifetime. We guarantee it unconditionally for five years.

Oil or grease cup in which adjustable hardened cone thrust bearing operates.

A *New Type* Campbell

Overhead Irrigation Sprinkler

THIS IS THE SPRINKLER YOU HAVE BEEN WAITING FOR — IS PERFECTLY BALANCED, HAS LONG UPPER AND LOWER BEARINGS, LUBRICATED HARDENED CONE THRUST, FELT STRAINERS TO KEEP SAND OUT OF BEARINGS AND MANY OTHER NEW FEATURES. WILL BE READY FOR DELIVERY DECEMBER FIRST.

BOOKS *of* PRACTICAL VALUE *to the* WATER USER *and the* HYDRAULIC TECHNICAL MAN

IRRIGATION ENGINEERING

By ARTHUR POWELL DAVIS, D. SC.

Chief Engineer and General Manager, East Bay Municipal Utilities District; formerly President Am. Soc. C. E.; formerly Director and Chief Engineer, U. S. Reclamation Service.

AND

HERBERT M. WILSON, C. E.,

Mem. Am. Soc. C. E.; former Chief Engineer and Irrigation Engineer, U. S. Geological Survey.

Seventh Edition, Revised and Enlarged; Total Issue 12,000

THIS IS a rewritten and rearranged edition with much new material added. The principal difference introduced is the treatment of soils, plant food, operation and maintenance, and other lines of work where the duties of the irrigation engineer come in contact with the irrigator, such as in the preparation of land, the duty of water and its application to the land. A bibliography of standard works is given at the end of each chapter. 640 pages. 6 by 9. 249 figures and illustrations. Cloth, $4.50 net postpaid. Remittance must accompany the order. Allow from one to two weeks for transmittal of order and shipment from the publishers.

IRRIGATION PRACTICE *and* ENGINEERING

By B. A. ETCHEVERRY,

Professor of Irrigation Engineering, University of California.

In three volumes—the most comprehensive work in the field. A wealth of information of both practical and informative value for everyone interested in water development and conservation. Prices are net postpaid and remittances must accompany order. Allow from one to two weeks for transmittal of order and shipment from the publishers.

Vol. 1.—Uses of Irrigation Water and Irrigation Practice.....$2.50
Vol. 2.—Conveyance of Water..... 4.00
Vol. 3.—Irrigation Structures and Distribution System..... 4.50

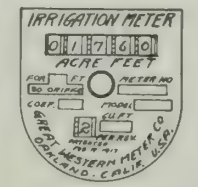
A GREAT WESTERN *Irrigation Meter*



will solve your measurement problems

It is on the job day and night. It is not affected by silt or trash. Meter is geared for orifice of any size (1-10 sq. ft. to 100 sq. ft.)

GREAT WESTERN METER COMPANY

1290 Powell Street

Oakland California

that delivers about three gallons per minute and covers an area up to sixty feet in diameter, by far the most economical and satisfactory.

When used for orchard irrigation this sprinkler is placed at alternate trees in alternate rows (one to each four trees) and when used for vegetables or other small crops forty-five to fifty feet apart and staggered so that each sprinkler will be exactly in the center and equidistant from the six sprinklers surrounding it.

UNDER certain conditions, especially where water is cheap and delivered under a high pressure, properly designed, larger coverage sprinklers can be used. I do not believe it is possible, however, to secure the uniform distribution obtainable with the smaller radius sprinklers, and the loss from evaporation is much higher. Many are of the opinion that the larger coverage a sprinkler has the lower the cost of installation but there is very little difference if high-grade pipe and other material is used.

In order that each sprinkler may deliver the same quantity of water, it is absolutely necessary that a stop cock or valve be used on each sprinkler stand; otherwise, even on perfectly level installation, the sprinklers nearest to supply would deliver much more than those farther away on the line and on hillside installations those on the lower levels, where the least water is required, would give more than those on the higher levels. Furthermore, in some instances it is necessary to have these cocks or valves in order to cut down the pressure so that the delivery will be in drops instead of a spray.

If the water supply comes from an open reservoir or other source containing moss or other matter, a strainer of sufficient capacity to handle the maximum amount of water used without friction loss should be installed at the source of supply. All pipe, no matter how clean it may be when first installed, will eventually begin to disintegrate and give off more or less scale on the inside; so it is vitally necessary that a strainer be used with each stand-pipe. In this connection I will call attention to the combination regulating valve and strainer now on the market, which usually is placed about twelve inches above ground level. This device also has a dirt trap which can be cleaned from time to time as necessary and is especially valuable in connection with sprinklers used for orchard irrigation, avoiding the necessity of either taking down the stand-pipe or using a ladder to clean scale or other matter out of the sprinklers. The writer regards this combination valve and strainer as vitally essential to an up-to-date installation.

The Power Behind the Pump

(Continued from Page 19)

ranging from 10 inches to 36 inches in diameter.

The wells are equipped with Layne & Bowler turbine pumps driven by Westinghouse Vertical Motors, with a total of 325 H. P. The water from these wells is delivered to a reservoir at the main booster plant. The booster plant lifts the water 156 feet through a 28-inch steel line to the higher level by means of three Byron-Jackson centrifugal pumps, direct connected to Westinghouse motors, a total of 425 H. P. Float switches are installed to open the no-voltage release circuit before the water drops to a level in the reservoir that might cause the pumps to break suction and operate dry.

In this main booster plant is located the switchboard, an example of the latest design. In place of using knife switches with fuses, oil circuit breakers are used with overload protection for each motor. Among other features are the recording voltmeter, giving a chart of the voltage at all times, as well as service interruptions. Ammeters are installed in each motor circuit to give the current load, and as a warning of mechanical troubles that might occur to the pumps.

In the upper zone there are two additional booster plants. Plant No. 4 has a maximum lift of 113 feet, and is equipped with two Byron-Jackson centrifugal pumps direct connected to two Westinghouse motors with a total of 115 H. P. Plant No. 5 has a maximum lift of 70 feet and is equipped with two centrifugal Byron-Jackson pumps direct connected to two Westinghouse motors, with a total of 90 H. P.

SWITCHBOARDS in plants No. 4 and No. 5 are of the same type and construction as those at the main booster plant. These plants are being equipped with pressure gauges to shut off the power, should the water fail at either suction or discharge.

Power is supplied by the Southern California Edison Co., over a 15,000-volt line, and is stepped down to 440 volts through suitable transformers, located at the three plants. At the main booster plant, drawing the largest load, three 200-Kva. type "SK" single phase, Westinghouse transformers are installed. At Zone No. 1, the Edison rate P-1 is in force, based on maximum demand instead of connected load. Zone No. 2 is operated on the P-11 schedule which is a better rate where the pumps lie idle for any considerable period of time.

The first water was pumped through the lines in July, 1923, and the plants have since been in continuous operation without interruption.

SURVEY *of* IRRIGATION DEVELOPMENT

As Shown by Official Records of the Month -- Local, State, and Governmental

RECORDS SHOW WATER IS INCREASINGLY IN DEMAND

PERMITS to appropriate water issued in California by the Department of Public Works, Division of Water Rights, during the month of September, include the following:

Permit No. 2220, Application No. 4479 (Los Angeles County)—Issued to Frank P. Raggio, and Chester Smith, Saugus, Cal., September 3, 1925, for 1.12 cubic feet per second from San Francisco Creek, in Sec. 23, T 5 N, R 16 W, for domestic and irrigation use on 90 acres near point of diversion. Estimated cost $3000.00.

Permit No. 2222, Application No. 4492 (Los Angeles County)—Issued to Eugene M. Frazier, Los Angeles, September 4, 1925, for 0.37 cubic foot per second from a well in Sec. 22, T 5 N, R 16 W, for irrigation of 30 acres in Sec. 22. Estimated cost $2000.

Permit No. 2226, Application No. 4339 (San Diego County)—Issued to Lakeside Irrigation District, Lakeside, Calif., September 8, 1925, for 1 cubic foot per second from Los Coches Creek in Sec. 19, T 15 S, R 1 E, for domestic use and irrigation of 324 acres in said district. Estimated cost $10,000.00.

Permit No. 2227, Application No. 4364 (Yolo County)—Issued to W. S. Kendall, Sacramento, September 8, 1925, for 7.25 cubic feet per second from Sacramento River in Sec. 13, T 11 N, R 2 E, for irrigation of 581.8 acres near point of diversion. Estimated cost $8000.00.

Permit No. 2228, Application No. 4356 (Tehama County)—Issued to F. L. Jolly, Jolly, Calif., September 8, 1925, for 0.99 cubic feet per second from Sacramento River in Sec. 3, T 28 N, R 3 W, for irrigation of 79.5 acres near point of diversion. Estimated cost $5000.

Permit No. 2229, Application No. 4342 (Napa County)—Issued to Chas. A. Davis, Rutherford, Calif., September 10, 1925, for 0.5 cubic foot per second from Napa River in Sec. 15, T 7 N, R 5 W, for irrigation of 40 acres near point of diversion. Estimated cost $2000.00.

Permit No. 2230, Application No. 4347 (Los Angeles County)—Issued to Arthur D. Gookins, Roosevelt, Calif., September 10, 1925, for 0.35 cubic foot per second from Richardson Canyon No. 617 and Cow Spring Canyon in Secs. 1 and 2, T 7 N, R 17 W, for domestic and irrigation purposes on 30 acres near point of diversion. Estimated cost $5000.00.

Permit No. 2232, Application No. 4597 (Placer County)—Issued to Ethel May Mulligan, Lincoln, Calif., September 15, 1925, for 0.56 cubic foot per second from Auburn, Calif., in Sec. 9, T 12 N, R 7 E, for irrigation of 45 acres near point of diversion. Estimated cost $2500.00.

Permit No. 2234, Application No. 4345 (Placer County)—Issued to John W. Swanson, Auburn, Calif., September 16, 1925, for 0.25 cubic foot per second from an unnamed ravine in Sec. 27, T 14 N, R 9 E, for irrigation of 35 acres in Sec. 27. Estimated cost $1000.00.

Permit No. 2235, Application No. 4213 (Siskiyou County)—Issued to Antone S. de Avilla, Gottville, Calif., September 16, 1925, for 2.06 cubic feet per second from Beaver Creek in Sec. 19, T 47 N, R 8 W, for irrigation of 165 acres in Secs. 5 and 6.

Permit No. 2239, Application No. 4431 (San Joaquin County)—Issued to Elda Slack, San Francisco, Calif., September 19, 1925, for 3.38 cubic feet per second from Old River in Sec. 31, T 1 S, R 5 E, for irrigation of 270.8 acres near point of diversion. Estimated cost $4000.00.

Permit No. 2241, Application No. 4399 (San Joaquin County)—Issued to John Ohm, Vernalis, Calif., September 21, 1925, for 13.19 cubic feet per second from San Joaquin River in Sec. 13, T 3 S, R 6 E, for irrigation of 1055.3 acres near point of diversion. Estimated cost $14,000.00.

Permit No. 2242, Application No. 4429 (San Joaquin County)—Issued to Mrs. A. Banta, San Francisco, Calif., September 21, 1925, for 3.19 cubic feet per second from Old River in Sec. 31, T 1 S, R 5 E, for irrigation of 271.7 acres near point of diversion. Estimated cost $4150.00.

Permit No. 2243, Application No. 4432 (San Joaquin County)—Issued to M. J. Lund, Stockton, Calif., September 21, 1925, for 16.13 cubic feet per second from Old River and Grant Line Canal in Secs. 16, 20, 21, 28, T 1 S, R 4 E, for irrigation of 1290.5 acres near point of diversion. Estimated cost $9000.00.

Permit No. 2244, Application No. 4452 (San Joaquin County)—Issued to L. A. Bixler et al, Stockton, Calif., September 21, 1925, for 32.15 cubic feet per second from Grant Line Canal and Midale River in Secs. 29 and 6, T 1 S, R 5 E, for irrigation of 2572.4 acres near points of diversion. Estimated cost $63,000.

Permit No. 2245, Application No. 4472 (San Joaquin County)—Issued to M. Rossi, Stockton, Calif., September 22, 1925, for 2.46 cubic feet per second from San Joaquin River in Sec. 10, T 2 S, R 6 E, for irrigation of 196.6 acres near point of diversion. Estimated cost $3,500.00.

Permit No. 2246, Application No. 4506 (San Joaquin County)—Issued to Harry C. Finck, Stockton, Calif., September 22, 1925, for 3.92 cubic feet per second from San Joaquin River in Sec. 16, T 2 S, R 6 E, for irrigation of 313.4 acres near point of diversion. Estimated cost $8000.

Permit No. 2247, Application No. 4512 (San Joaquin County)—Issued to Wm. C. Ferguson, Stockton, Calif., September 22, 1925, for 5.79 cubic feet per second from Grant Line Canal in Section 25, T 1 S, R 4 E, for irrigation of 463.1 acres near point of diversion. Estimated cost $16.000.00.

Permit No. 2248, Application No. 4513 (San Joaquin County)—Issued to Wm. Ferguson et al, Stockton, Calif., September 22, 1925, for 12.72 cubic feet per second from Grant Line Canal in Section 25, T 1 S, R 4 E, for irrigation of 1017.3 acres near point of diversion. Estimated cost $16,000.00.

Permit No. 2249, Application No. 4383 (Los Angeles County)—Issued to R. P. Shea, Los Angeles, September 23, 1925, for 0.02 cubic feet per second and 10 acre feet per annum from Indian Springs and flood waters in Section 17, T 7 N, R 14 W, for domestic and stock watering purposes in Sec. 17. Estimated cost $10,000.00.

Permit No. 2252, Application No. 4451 (San Joaquin County)—Issued to Lewis Moreing, Sacramento, Calif., September 25, 1925, for 4.25 cubic feet per second from San Joaquin River in Sec. 4, T 2 S, R 6 E, for irrigation of 339.8 acres near point of diversion. Estimated cost $17,000.00.

Permit No. 2253, Application No. 4470 (San Joaquin County)—Issued to Lewis Moreing, Sacramento, Calif., September 25, 1925, for 14.14 cubic feet per second from San Joaquin River in Sec. 16, T 2 S, R 6 E, M.D.M. for irrigation of 1131 acres near point of diversion. Estimated cost $34,000.

Permit No. 2254, Application No. 4471 (San Joaquin County)—Issued to Moreing Brothers, Stockton, Calif., September 25, 1925, for 7.83 cubic feet per second from San Joaquin River in Sec. 27, T 2 N, R 5 E, for irrigation of 626.7 acres near point of diversion. Estimated cost $14,000.00.

Permit No. 2255, Application No. 4237 (Stanislaus County)—Issued to Patterson Ranch Co., Patterson, Calif., September 29, 1925, for 27.36 cubic feet per second from San Joaquin River in Sec. 22, T 5 S, R 8 E, for irrigation of 2189.29 acres near point of diversion. Estimated cost $35,000.00.

Permit No. 2257, Application No. 4165 (Siskiyou County)—Issued to E. C. and Kate C. Hart, Montague, Calif., September 30, 1925, for 600 acre feet per annum from Little Shasta River in Sec. 19, T 45 N, R 4 W, for irrigation of 1724.6 acres near point of diversion. Estimated cost $9200.00.

Applications Filed

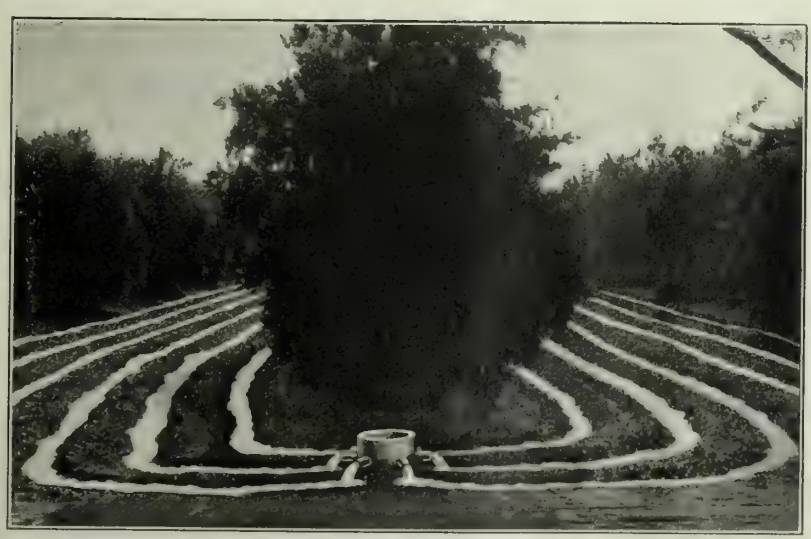
Among the applications for permit to appropriate water received by the Department of Public Works, Division of Water Rights of California, during the month of September, are the following:

Application No. 4759 (Los Angeles County)—Grace Oster Kamp, care Seaboard Engineering Co., Douglas Bldg., Los Angeles, for 0.6 cubic foot per second from an unnamed spring tributary to Triunfo Creek to be diverted in Section 7, T 1 S, R 18 W, S. B. M., to be used for irrigation and domestic purposes. Estimated cost $5000.00.

·SNOW·

IRRIGATION APPLIANCES

SNOW NO. 2 UNDER-ARCH ORCHARD VALVE



Water controlled with Orchard Valves and Galvanized Distributing Gates. In the orchard illustrated the furrows are 330 feet long. Note the thorough irrigation and uniformity and thrift of the trees.

CONCRETE MACHINERY & SUPPLY COMPANY

Exclusive Distributor

2014 SANTA FE AVENUE **LOS ANGELES, CALIF.**

For Detailed Listings, Branch Offices, Etc., See the Buyers' Guide to Leading Supply Sources—Pages 55-56

Application No. 4760 (Placer County)—Fred Dewhirst, trustee, care E. Emerson, Hoar Co., 995 Market St., San Francisco, for 300 cubic feet per second and 100,000 acre feet per annum from Bear River, tributary to Feather River, to be diverted in Section 2, T 13 N, R 8 E, M.D.M. for agricultural and domestic purposes on 60,000 acres in T 12 N, R 5-6-7 E and T 13 N, R 5-6-7 E, M.D.M.

Application No. 4761 (San Bernardino County, California) (Yuma and Mohave Counties, Arizona)—City of Los Angeles and Board of Water and Power Commissioners, care W. B. Mathews, 609 Public Service Bldg., Los Angeles, for 15,000 cubic feet per second and 600,000 acre feet per annum from Colorado River, tributary to Gulf of California, to be diverted in Section 2, T 1 N, R 26 E, S.B.M. for generation of hydro-electric energy in Section 2, T 1 N, R 26 E, S.B.M. 255,682 T.H.P. to be developed

Application No. 4766 (San Joaquin County)—California Land & Finance Co., care Ohm & Raab, 517 E. Market Street, Stockton, Calif., for 21.2 cubic feet per second from Fourteen Mile Slough tributary to San Joaquin River, to be diverted in (1) Sec. 24, T 2 N, R 5 E, (2) Sec. 30, T 2 N, R 6 E, (3) Sec. 29, T 2 N, R 6 E, M.D.M. for irrigation of 1702.2 acres, Sections 24 and 25, T 2 N, R 5 E, M.D.M. and Sections 19, 20, 21, 29, 30, T 2 N, R 6 E, M.D.M. Estimated cost $33,600.00.

Application No. 4768 (Amador & Calaveras Counties)—East Bay Municipal Utility District, 505 17th St., Oakland, California, for 375 cubic feet per second and 217,000 acre feet per annum from Mokelumne River, tributary to San Joaquin River, to be diverted in Section 26, T 5 N, R 10 E, M.D.M. for generation of hydro-electric energy in Section 26, T 5 N, R 10 E, M.D.M. 14,925 TH.P. to be developed. Estimated cost, $6,000,000.00.

Application No. 4769 (Calaveras County)—D. Fricot, Angels Camp, Calaveras Co., California, for 500 acre feet per annum from San Antonio Creek, tributary to South Fork of Calaveras River, to be diverted in Section 9, T 4 N, R 14 E, M.D.M. for irrigation and domestic purposes on 550 acres in Sections 27 and 28, T 4 N, R 13 E, M.D.M. and Sec. 36, T 4 N, R 12 E, M.D.M. Estimated cost $10,000.

Application No. 4770 (Calaveras County)—D. Fricot, Angels Camp, Calaveras Co., Calif., for 500 acre feet per annum from San Antonio Creek, tributary to South Fork Calaveras River, to be diverted in Section 9, T 4 N, R 14 E, M. D. M. for generation of hydro-electric energy in Section 27, T 4 N, R 13 E, M.D.M. 62 T.H.P. to be developed. Estimated cost $10,000.

Application No. 4771 (Alpine County)—Alhambra Mining Corporation, care J. W. Hopkins, Manager, Gardnerville, Nevada, for 7.5 cubic feet per second and 500 acre feet per annum from Crater Lake, tributary to West Fork Carson River, to be diverted in Sec. 11, T 10 N, R 18 E, M.D.M. for generation of hydro-electric energy in Sec. 11, T 10 N, R 18 E, M.D.M. 213 T.H.P. to be developed.

Application No. 4773 (Los Angeles County)—Nannie S. Biddison, Saugus, Calif., for .08 cubic foot per second from Biddison Spring, tributary to Santa Clara River Watershed, to be diverted in Sec. 22, T 6 N, R 14 W, S.B.M. for domestic and irrigation purposes in Section 22, T 6 N, R 14 W, S.B.M.

Application No. 4788 (Lake and Mendocino Counties)—Snow Mountain Water and Power Company, care Max Thelan, Balfour Bldg., San Francisco, for 400 cubic feet per second and 214,813 acre feet per annum from South Eel River, to be diverted in Section 14, T 18 N, R 10 W, M.D.M. and Section 30, T 18 N, R 11 W, M.D.M. for generation of hydro-electric energy at plants (1) Sec. 14, T 18 N, R 10 W, (2) Sec. 6, T 17 N, R 10 W (3) Lot 96, Yokaye Rancho —43,226 T.H.P. to be developed. Estimated cost $6,954,910.00.

OREGON

The following applications for permit to appropriate water have been filed in the office of Rhea Luper, State Engineer of Oregon:

Wilbur Broughton of Hebo, covering the appropriation of water from Deep Creek for irrigation of 36 acres and domestic purposes in Tillamook County, at a cost of $1,500.

Paul Schuttpelz of Lakeside, covering the appropriation of water from Hall Creek for domestic supply for city of Lakeside, Oregon, in Coos County, at a cost of $3,000.

Central Pacific Railway Company of San Francisco, California, covering the appropriation of water from Cascade Creek, and also from South Fork of Salt Creek for railroad and domestic supply in Lane County, Oregon, at a cost of $4,800.

Thomas J. Tyrrell of Unity, covering the construction of the Tyrell Reservoir for storage of 70-acre feet from Burnt River Watershed for irrigation purposes in Baker County, at a cost of $1,800.

W. A. Wagner and K. S. Francis of Enterprise, covering the appropriation of water from Hurricane Creek and two springs for irrigation of 144.5 acres in Wallowa County.

William W. Brown and Bertha M. Forbes of Stauffer, covering the appropriation of water from Benjamin Lake for irrigation of 380 acres in Lake County.

F. S. Morrison of Halfway, covering the appropriation of waste water and slough water from certain lands irrigated from Clear Creek for supplemental irrigation of 40 acres in Baker County.

W. G. Scott and Chas. P. Nelson of Portland, covering the appropriation of water from a small stream or branch for municipal purposes for Nelscott Beach, in Lincoln County, at a cost of $1,000.

Power Developments

The Federal Power Commission, in October, authorized issuance of licenses and permits, including the following:

Project No. 137—To J. W. Preston, Jr., of San Francisco, a license for 50 years for a power project designated as "Salt Springs Unit" located on the North Fork of the Mokelumne River partly within the El Dorado and Stanislaus National Forests, in Amador and Calaveras Counties, California. The project will consist of a rock-fill dam approximately 200 feet high and 960 feet long, and a conduit about 25 miles in length to convey the water from the reservoir created by the dam to a power house, designed to have an installed capacity of about 42,000 horsepower. The power generated will be used in the Pacific Gas & Electric Company's power system. This project is a part of a comprehensive scheme for the development of the river.

Project No. 338—To the Nevada Irrigation District, a municipal organization with headquarters at Grass Valley, Nevada County, California, license for 50 years for storage and diversion of water from Middle Yuba River and Canyon Creek (a tributary of South Yuba River) for combined power development and irrigation use. The project involves diversion from the Middle Yuba at the Milton dam site through a tunnel 4 miles in length to Bowman Reservoir in Canyon Creek. The regulated supply from this reservoir and another up-stream at French Lake will be carried by conduit about 11 miles to the rim of Spaulding Reservoir on the South Yuba. The water will then be conducted through the Spaulding power plant of the Pacific Gas & Electric Company, a part of the discharged water going through the South Yuba canal and Deer Creek plant to the upper lands of the District and the remainder through the Drum Canal and power plant to Bear River for diversion to the lower lands. The estimated installed capacity of the project is 150,000 horsepower.

Project No. 492—To J. E. Walker, of Mackay, Idaho, a license for 50 years for a power project on Big Boulder Creek partly within the Challis National Forest, in Custer County, Idaho. The project will develop approximately 153 horsepower to be used in mining operations.

Project No. 529—To the Oregon-California Hydro-Electric Company, of Portland, Oregon, a preliminary permit for two years for a power project on Zigzag, Salmon, and Sandy Rivers, in Clackamas County, Oregon. The project consists of diversion dams, a storage dam, conduits, and a power house. The estimated power capacity of the project is 23,000 horsepower, and the installed capacity, 70,000 horsepower.

Project No. 570—To the Appleton Land, Water & Power Company, of Los Angeles, California, a preliminary permit for two years for a proposed power development within the Santa Barbara National Forest on Deep Creek, a tributary of Mohave River, in San Bernardino County, California. The project consists of a storage dam designed to create about 1,000 acre feet of storage, with about three miles of water conduit, and a power house having an approximate installed capacity of 7,900 horsepower. The power generated will be used primarily for irrigation pumping.

Project No. 588—To the Northwest Power & Light Company, of San Francisco, California, a preliminary permit for two years for a power development in the Elwha River, Clallam County, Washington. The project will consist of a concrete dam with an adjacent power house developing about 160 feet in head in Glines Canyon. The reservoir formed by the dam will impound about 15,000 acre feet of water. The power capacity of the project is about 7,900 horsepower.

Project No. 619—To the Feather River Power Company, of San Francisco, California, a license for 50 years for a power project on Bucks, Grizzly, and Milk Ranch Creeks, tributaries of the North Fork of Feather River, in Plumas County, California. The project consists of a dam in Bucks Creek 106 feet high creating a reservoir with approximately 103,000 acre feet of storage, diversion dams, and conduits, tunnels and penstocks leading to a power house on the North Fork of Feather River a quarter mile below the mouth of Bucks Creek. The power house will have an installed capacity of 60,000 horsepower. The power generated will be used in the power system of the Great Western Power Company.

New Incorporations

No. 116050—SNOW CANYON MUTUAL WATER COMPANY, (a California company). Directors: N L Levering, Redlands; L. G. Levering, Redlands; E. C. Gird, Hollywood; W. H. Johnson, Redlands; Fred A. Wilson, San Bernardino; (each 1 share). Date of filing, Oct. 14, 1925. Place of business, Redlands. Capital stock, $15,000. Par value, $20. Amount subscribed $100. Purposes to furnish water to stockholders only at cost. Articles filed by Swing & Wilson, Garner Block, San Bernardino.

No. 116088—YALE MUTUAL WATER COMPANY, (a California company). Directors: W. P. Banes, L. G. Brubaker, B. A. Harbour, R. F. Guthrie, J. W. Hays, all of Hemet. Date of filing, Oct. 16, 1925. Place of business—Hemet. Capital stock, $15,000. Par value, $50. Purposes to furnish water to stockholders only, without profit to company for domestic and irrigation purposes, upon certain parcels of land in Lot One in block 110, subdivision of land of Hemet Land Company in Hemet, County of Riverside. Articles filed by Henry Goodcell, 306 Katz Bldg., San Bernardino.

No. 116126—SANTA RITA IRRIGATION COMPANY, (a California company). Directors: J. Leroy Nickel, Jr., San Francisco; Vincent J. McGovern, San Francisco; H. T. Gower, San Francisco; W. S. Mitchell, Alameda; W. H. Trump, San Anselmo, (each one share). Date of filing, Oct. 20, 1925. Capital stock, $20.000. Par value, $100. Amount subscribed, $500. Place of business, San Francisco. Purposes to supply and deliver water for irrigation and domestic uses to lands in the San Joaquin River water shed now owned by Miller & Lux, Inc. (a Nevada company). Articles filed by J. E. Woolley, 1128 Merchants Exchange Building, San Francisco.

No. 116150—COUNTRY CLUB PARK MUTUAL WATER COMPANY (a California company). Directors: Frank C. Nye, 24 shares; Xina Adair Nye, one share; J. R. Gabbert, all of Riverside, one share. Date of filing, Oct. 21, 1925. Place of business, Riverside. Capital stock, $3,900. Par value, $150. Amount subscribed, $3900. Purposes to purchase 26 shares of capital stock of Gage Canal Company and transfer one share of such stock to the owner of each lot in the Country Club Park and pipe water to said lots for the use of said owners on said lots. Articles filed by A. Arid Adair, 202 Loring Building, Riverside.

No. 116180—NORTH LONG BEACH EXTENSION WATER COMPANY (a California company). Directors: J. L. Bentley, Wm. Reed, T. R. Johnson, J. Kratzer, G. W. Wheatland, Long Beach. Date of filing, Oct. 23, 1925. Place of business, Long Beach. Capital stock, none. Purposes to take over the wells and water plants on Tracts 5992 and 6018 as per Maps of record in County Recorders office of Los Angeles County, and to furnish water to the owners of said tracts of land without profit, supply same at cost of maintaining said wells of water. Articles filed by L. D. Uhlman, 1225 Pacific-Southwest Bank Building, Long Beach.

Overhead System on 10 Acres

A ten-acre installation of sprinklers has been completed on the Henry Behrens citrus ranch, at Yorba Linda, in Southern California.

Concrete-Lined Reservoirs

(Continued from Page 18)

into three compartments, so arranged that either half of the ultimate 10,000,000 gallon reservoir can be operated independently of the other half. Two 24 inch cast iron pipes lead from the tower through a concrete culvert under the embankment to the mains in the street and one 12 inch cast iron drain pipe connects with the sewer.

BIDS WERE called for, the contractor to furnish labor and material, excepting the pipe, sluice gate, gate valves for the outlet works. These were to be furnished and installed by the owner. The owner also was to furnish and place the plastic material in the expansion joints. Three bids were received ranging from $62,400.00 to $70,200.00, and the lowest bidder got the job for $62,405.50.

A steam shovel was used for excavating and the material transported to the embankment by dump wagons where it was spread in four-inch layers wet down and rolled with a ten-ton roller. This excavation was carried to within two or four inches of the final grade, then trimmed to grade and made ready for the concrete lining; during the excavation, springs were encountered which were drained by a six-inch cast iron pipe along the toe of cut on the uphill side, thence under the division wall through the embankment on the downhill side. No further trouble was encountered from that source. After the floor and side slabs were poured the roof columns were erected by a derrick using a Ford truck for power which ran on the completed floor.

The contractor finished his work in three months. The owner then cleaned the expansion joints and placed the plastic material, which in this case was a patent compound—a combination of tar and asbestos filler.

AMONG OUR CONTRIBUTORS

Editorial Jottings About Current and Forthcoming Feature Articles, Dealing With Practical Problems of Hydraulics, and the Men Who Have Written Them

THE ENGINEER holds the place of honor in this issue of MODERN IRRIGATION. The interesting problems of construction met and overcome by the Vista Irrigation District are described by Kenneth Q. Volk, who is chief engineer in charge of the work about which he writes. The problems of alkaline soils are dealt with by D. W. Murphy, a consulting engineer recognized as an authority on drainage and underground water problems. Two prominent waterworks engineers are the authors of "The Design and Construction of Concrete-Lined Distributing Reservoris," and "Standards of Service Connection Installations."

Mr. Volk, who is a new contributor in this issue, is associated with J. B. Lippincott, one of the best known of California's consulting engineers. He has been engaged in irrigation engineering in the southwest for the past twelve years, having become connected with Mr. Lippincott's office soon after his graduation from the University of California as an irrigation engineer. For some time he was a resident engineer on the Santa Fe Irrigation District, and now holds that position on the Vista District.

DANIEL W. MURPHY, who discusses problems of alkalinity in this issue, is a graduate of Stanford University, having received the degrees of A. B., A. M. and Ph. D. from this institution. He also studied at the Physicalishe Reichsanstalt, in Charlottenburgh, Germany. From 1896 to 1900, he was Assistant Professor of Physics at Stanford University.

Mr. Murphy entered the United States Reclamation Service in 1904, and occupied successively the positions of Project Engineer of the Klamath Project in Oregon, Office Engineer in the Washington Office, and, from 1911 to 1918, Drainage Engineer. In the latter position, he was in charge of drainage work on all of the projects of the service, including fifteen projects throughout the west which required drainage.

Since leaving the Reclamation Service, in 1918, Mr. Murphy has been in private consulting practice in Los Angeles, specializing in irrigation, drainage and underground water problems. During this time, he has been connected with the largest and most important drainage projects in the southwest, including the drainage of the Salt River Valley, in Arizona, and the Palo Verde and Imperial Valleys, in California.

Mr. Murphy is co-author with F. H. Newell of "Principles of Irrigation Engineering," and author of "Drainage Engineering." His scholarly attainments, large and diversified practical experience, and sound engineering and business judgment, combine to make him a recognized authority on drainage and underground water problems.

WRITING on the subject of "A Constructive Irrigation Program for Oregon," W. L. Powers is able to speak as a representative of practically all hydraulic interests of that state. Mr. Powers was recently named secretary of the reborn Oregon Reclamation Congress (formerly the Oregon Irrigation Congress) and has been an active member of that organization since its inception in 1910; he has been secretary of the State Drainage Association since its formation ten years ago; and for ten years has been doing a very valuable work for the state and for irrigation, as Chief of the Division of Soils, at the Oregon Experiment Station, at Corvallis. The departments with which he is concerned are Soil and Soil Water, so that much of his work is with the practical problems of irrigation and drainage.

D. W. MURPHY
Consulting Engineer

Two other well-known names connected with irrigation research appear in this issue—Samuel Fortier and Fred C. Scobey. Neither requires introduction to an irrigation audience. Both are connected with the Berkeley Office of the Division of Agricultural Engineering of the Department of Agriculture, and have contributed much to the technology of the industry through their work. The article appearing under their names is an abridged presentation, which they have prepared for this magazine, of their paper, under the same title, published in full in the Proceedings of the American Society of Civil Engineers, of which they are members.

HUGH CRANE, author of the article describing the irrigation display at the Fresno Fair, is a staff contributor. I. E. Flaa is chief draughtsman of the Spring Valley Water Company, San Francisco. George Read, author of the paper presented on Page 22, is superintendent of the meter and service department of the Bureau of Water Works and Supply of the City of Los Angeles. The latter two articles are taken from papers presented at the October convention of the California Section of the American Water Works Association.

John Dwight Neale, who tells what Oregon irrigation needs from the standpoint of the security buyer, is known to MODERN IRRIGATION readers from previous contributions. He is identified with J. R. Mason & Company of San Francisco. J. P. Campbell is president of the J. P. Campbell Irrigation Company.

HOPE deferred maketh the heart sick, but in the case of B. J. Seger's good article on "Credit for Irrigation Projects—How to Establish and Maintain It," which was promised to our readers for this issue, an unavoidable postponement has been necessary which, it is to be hoped, will only serve to sharpen the appetite. Mr. Seger's discussion of irrigation's credit problems, with which he is intimately familiar, is in type, but other material, which would not permit of postponement to the December number, displaced it at the last minute. Mr. Seger's contribution will appear in December.

SEVERAL other features of special interest are due for presentation in the concluding number of Volume I of this magazine. A general survey of irrigation developments since 1918, by Thomas H. Means, San Francisco engineer, will appropriately close the calendar year. Everett M. Bryan, deputy chief of the Division of Water Rights of the California Department of Public Works, has written a vitally interesting article on "Importance of Orderly Establishment of Water Titles," a question of significant importance wherever irrigation is practiced. George M. Jewett, president of the Federal Land Bank at Spokane, Washington, has contributed a valuable discussion of an up-to-date phase of irrigation finance, under the title "Federal Farm Loans on Irrigated Lands." Irving C. Harris, Los Angeles Power Engineer, will write on the connection between irrigation and hydro-electric developments, bringing out some little-known data on this subject. Mr. Harris for five years had charge of the construction and operation of the power system and pumping plants on the Salt River project, in Arizona, and is thoroughly familiar with the hydro-electric side of irrigation work.

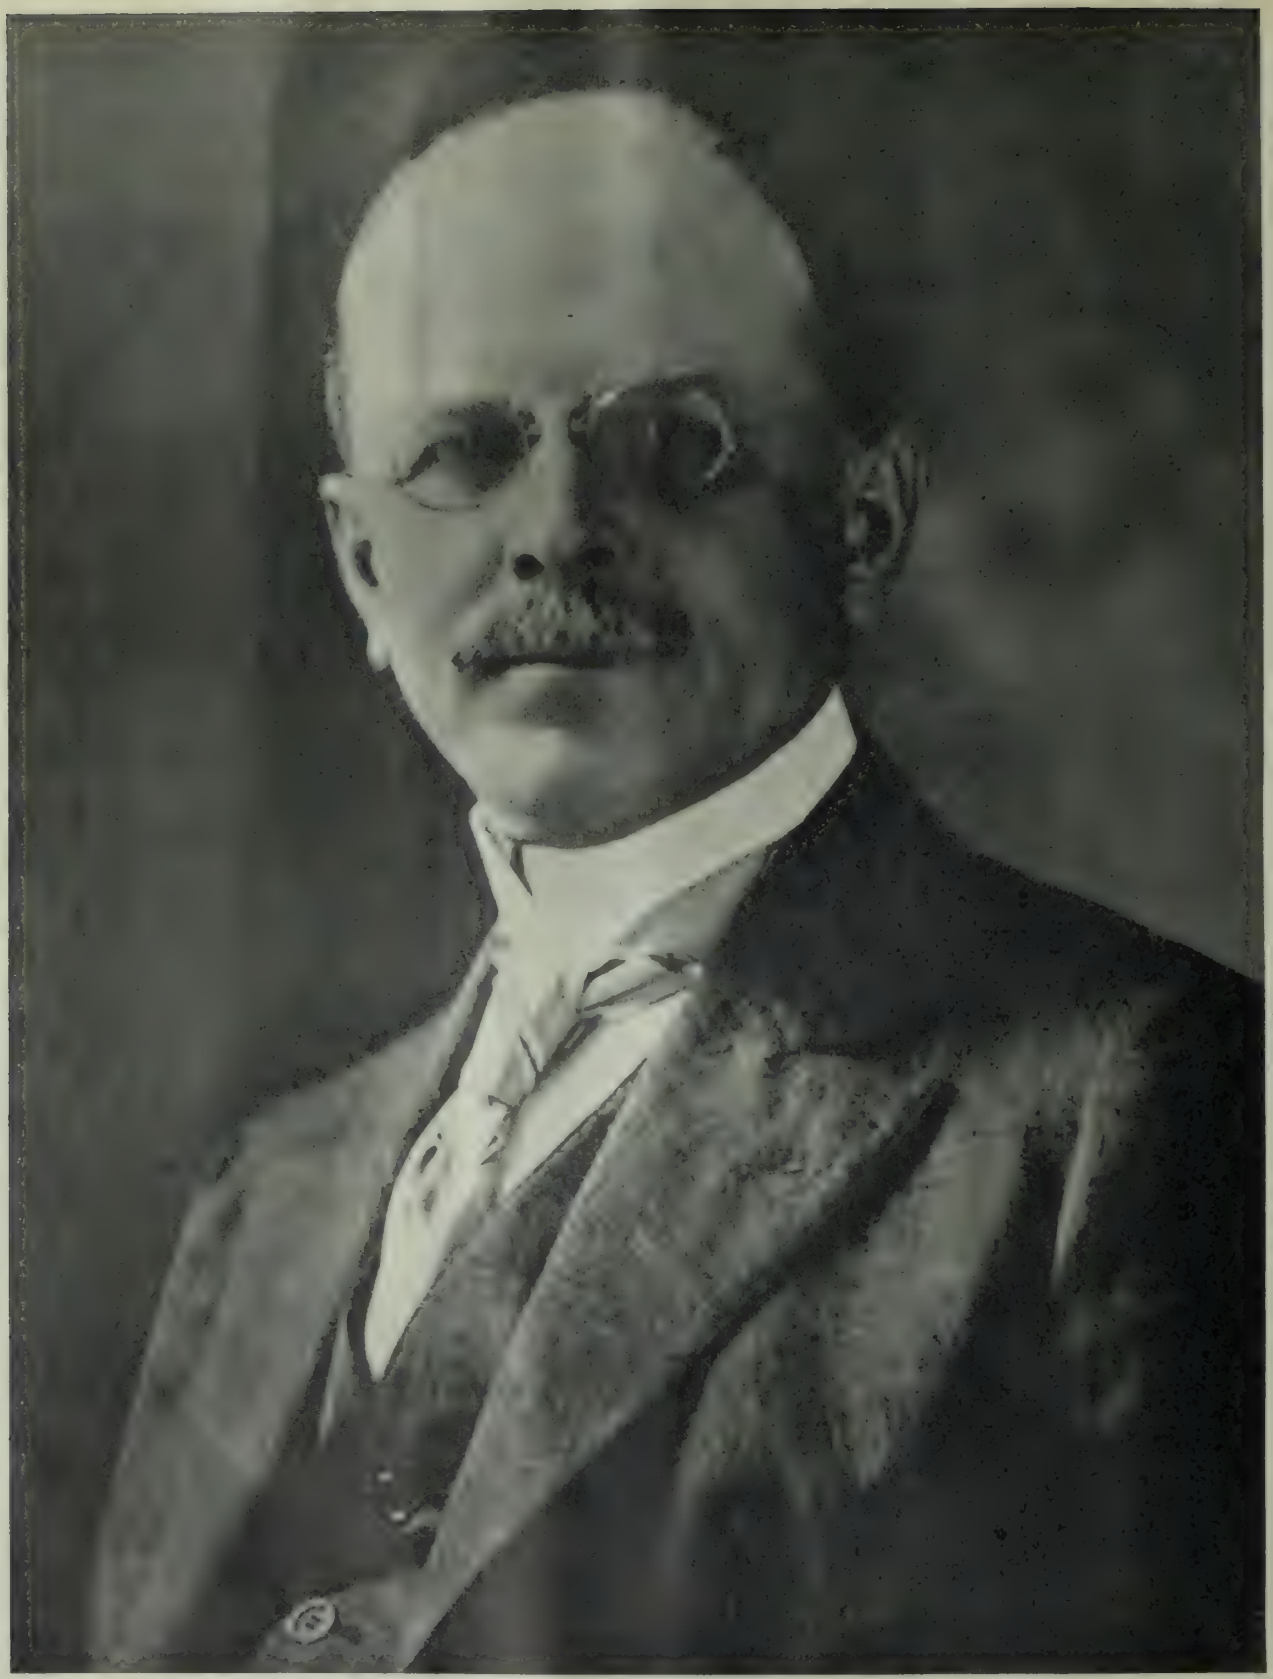
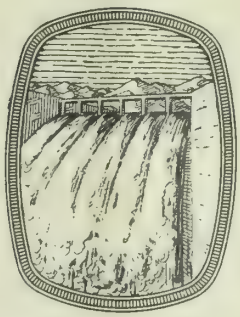
PETROLEUM WORLD 626 S. SPRING ST., LOS ANGELES, CALIF. MODERN IRRIGATION



ADDISON T. SMITH

Representative in Congress from Idaho, and chairman of the House Committee on Irrigation and Reclamation. In an article in this issue Mr. Smith discusses, from the standpoint of the national legislature, some of the leading current problems of reclamation. He has seen reclamation's needs at first hand, having had an experience in the governmental treatment of such problems as an attorney, a land-office official, and as a Congressman since 1913, and is ably qualified to speak with authority on such matters.

MODERN Irrigation
The Magazine of Applied Hydraulics



Volume 1 DECEMBER, 1925 Number 6

The Progress *of* Irrigation

NINETEEN TWENTY-FIVE has been a year of preparation in the hydraulic and irrigation industries. As we review it in perspective, it seems apparent that this year must be classed with those significant periods in time which, of themselves, offer few highlights in sensational events, but which, nevertheless, are necessary for the gathering of the forces that ultimately flash across history's page in splendid attainments. Before every era of constructive achievement there must be some such period of transition: when determinations are forming, plans are crystallizing, differences are being harmonized, and social opinion is in a state of flux—from which it emerges with new strength to urge its servants forward to spectacular accomplishments.

Glancing around the world we see that irrigation has been making steady strides forward in other continents than our own, as is pointed out in a review of world developments in this issue. With the exception of California, where certain notable projects are going ahead quietly but steadily, America has lagged behind somewhat in the race, if her advance be measured by works actually undertaken and completed. And yet, when the final story is told, it will probably be said that 1925 was a year of real progress. New concepts have been forming, stock has been taken of the past, its errors and its successes, old theories have been scrapped and new ones formulated, and the way has been cleared for a faster, more direct, march forward in the future.

THIS CONDITION has been especially true, and indeed has been especially necessary, in those branches of hydraulic development where politics plays an important part. The irrigation industry has proved itself competent to handle, in most cases, the engineering and economic factors with which it must deal. Where political considerations enter it has been woefully unsuccessful.

In such typical cases as the developments undertaken in California by the Merced Irrigation District in the construction of the Exchequer Dam, and the East Bay Municipal Utilities District in reaching out to the Mokelumne River for new water supplies for domestic and irrigation use, the continued success and expansion of the Salt River project in Arizona, and other similar enterprises, able engineering direction and wise finan-

cial planning, freed from political interference, are recording a steady progress. On the other hand, the disputes surrounding government reclamation policies in Idaho and Oregon, the Colorado River impasse, in which state and national politics are hopelessly entangled, the Kittitas project, the Columbia Basin project in Washington, and the dissension which divides the Imperial Irrigation District, present admirable examples of the destructive influence of the political element.

IRRIGATION is learning, as other big business has long since learned, to beware of unnecessary political interference. Many reclamation developments are undoubtedly the proper function of the federal government, but conservative judgment dictates that neither federal support, nor state aid, nor legislative panaceas of whatever kind, may be relied upon to make irrigation, or hydro-engineering enterprises of whatever character, a success.

As the sixty-ninth Congress convenes, therefore, the industry looks to it with interest, but without much hope. Congressional committees by the dozen have visited western lands in the past year, and out of their investigations and reports much good may come. But the industry is not dependent upon legislatures for its vitality. Economic laws transcend the statutes of all of these, and upon technical and economic foundations it has it within its power to build a strong and imperishable structure.

CONGRESS will be called upon to consider, during the coming session, the McNary Reclamation Bill, which has excited interest and both favorable and unfavorable comment in the industry. But it is doubtful whether definite action will be taken on it, for Senator McNary has hinted, privately, that because of the general condition of chaos surrounding reclamation, in which the Republican leaders of the irrigation committees in both house and senate are at variance with the administration, the bill may not be pressed in the coming session.

However one may look upon the policies of the present heads of federal reclamation, it is indisputable that the Reclamation service, so called, represents a most important phase of irrigation, and it is one which, during the year just passing, has received a large and increasing share of public attention; and may fairly be said to have accomplished some measurable steps of progress.

In the annual report which has just been submitted by Elwood Mead, Commissioner of Reclamation, covering the activities of the Bureau for the past fiscal year, it is shown that lands irrigated from federal reclamation works, in the period covered, produced crops worth nearly $110,000,000, an increase of $7,000,000 over the previous year. On the federal projects proper, 1,216,610 acres were cropped, the gross value of all crops being $66,488,560.

Construction work, under this Bureau's direction, for the conservation and utilization of the water resources of the nation has also made forward strides. Construction of the Tieton dam on the Yakima project, Washington, and the Black Canyon dam in Idaho, were completed; and the Gerber dam on the Klamath project has been virtually finished. Work is continuing on the McKay dam for the irrigation of the greater Umatilla project in Oregon, and the Bureau has begun work on the Guernsey dam of the North Platte project.

Perhaps more important than the work which the Bureau is doing with steel and masonry is that larger task to which it has devoted itself, of bringing reclamation out of its slough of financial debility to a point where it may function efficiently for the purposes for which it was first conceived.

THIS DEPARTMENT of its work, also, has been materially advanced in the past year. The secretary and the commissioner spent ten weeks in 1925 on tours of inspection of projects in the west. Although in some cases their visits were followed by indignant protests from the proponents of many of the projects, alleging that their "inspections" were casual and superficial, it can hardly be questioned that by getting in personal touch with the projects and the settlers, the responsible heads of reclamation have informed themselves more accurately of actual conditions and needs than they might have done in any other way.

In their effort to collect the money due the government from project settlers, they have encountered many vexing problems, but according to the annual report of the Bureau they have succeeded in the first steps of the task, and have collected hundreds of thousands of dollars from settlers who were able to pay, but who would not have paid except under the most insistent pressure.

Thirteen and a half million dollars have been authorized for expenditure on federal reclamation projects during the fiscal year of 1926. The last congress made direct appropriations totalling $4,330,000 for four new projects and for the extension of new areas on three existing projects that will entail an ultimate expenditure of $60,000,000. There is no danger that reclamation activity will flag for the lack of funds. Its dangers lie in other directions, and the fiscal policies of the Bureau of Reclamation, although they have been bitterly criticized, seem well adapted to protecting federal reclamation from future failures.

Irrigation in the Four Corners of the Earth

A Survey of the World's Important Water Developments Since the War

By THOMAS H. MEANS

THOMAS H. MEANS
Consulting Engineer

RECENT news items announced the completion of the Sennar Dam and the opening of the first irrigation canals near Khartoum in the Soudan. Probably few Americans gave the matter more than a passing notice and a still smaller number had any idea that this great irrigation project, on which cotton is to be grown, might have an important effect on the future of irrigation in our own Southwest. Irrigation work in America is going through a period of destructive, rather than constructive, criticism at this time and it is interesting to note that there are parts of the world in which large works are being built and kindly words spoken of irrigation and its possibilities.

As one looks over the foreign field one readily sees that irrigation is forging ahead more rapidly than at any time in the history of the world. Some of the largest irrigation works ever built have been commenced and completed since the World War, although none of these great activities has been in America.

FOREMOST among the countries in which irrigation work is being carried on are the colonies and dependencies of Great Britain. In India, Egypt, Soudan and Australia, very large works have recently been built and new areas of land colonized or old irrigated areas have been furnished with better supplies of water. There is a definite plan in all this work—a plan backed by the clear-visioned, farsighted Englishmen who control the destinies of the Empire. This plan is to grow for themselves the crops which supply the raw materials for England's manufacturers, and to make the nation independent of foreign powers as far as possible.

England has long been dependent on the American cotton growers, who produce sixty per cent of the world's cotton. This dependence on another nation for so essential a commodity has not been accepted with complacency by Great Britain, for obvious reasons, and for many years attempts have been made to grow cotton in the Empire, but with indifferent success. Now, however, there is every possibility that success will crown their efforts. Long deferred plans are being set in motion and there is every likelihood of these being carried to completion. Cotton is the main crop on the new irrigated areas in England's outlying territory.

THE INTERESTING bit of news first referred to—the completion of the Sennar Dam just before a Nile flood and the opening of the Gezirah canals—is one of the most important steps in Britan's great plan. The Gezirah lies just north of Abyssinia in the basin of the Blue Nile. The Sennar Dam, on that stream, is 249 miles above Khartoum. The arrea to be irrigated lies in the triangle between the White and Blue Niles. This area of three million acres of fertile soil in a tropical climate, suitable for the growing of all sorts of crops, is the largest single irrigation project ever undertaken.

The annual flow of the Nile approximates 75,000,000 acre-feet, about the average flow of all of the streams of California combined. Egypt has 6,000,000 acres of irrigated land and hopes some day, by reclaiming the salt lands and by pumping to higher levels, to extend the area to a little over 7,100,000. In low flood years there have been times when the amount of water at low flow was not enough to supply all of the land. Nearly every year dams of sand are built in the Deltaic branches of the Nile, close to the Mediterranean, to hold back the salt water and permit the last drop of the return seepage water to be pumped to the thirsty soil. In some years when a short supply of water is expected, the culture of rice is forbidden because of the large amount of water required at the time it is most deficient.

IT IS NO wonder then that Egypt has jealously guarded the upper waters of he Nile and objected to any use or diversion in Soudan. The proposal of the English Engineer officers to undertake irrigation in the Soudan was one of the causes of the separation of the Soudan from Egypt. Only since Great Britain's control of the upper country has been free from Egyptian interference has there been any real attempt to carry out the plans for irrigation in the Soudan, although these plans were proposed twenty years ago. This water right controversy was one of the underlying causes of the revolution in Egypt. It was only after exhaustive study of the problem and development of storage plans that the irrigation of the Gezirah could be undertaken. A recent communique from the Government Press Bureau in Cairo indicates that Egyptian officials are now satisfied that the Gezirah can be irrigated without depleting Egypt's water supply.

The Sennar Dam, estimated to cost over $7,000,000 and probably the largest structure ever built for irrigation, was completed last winter and used for the first time in 1925. It is a combined masonry and earth dam over two miles long and 110 feet high, which raises the water of the Blue Nile about 100 feet above low water. Sluices like those in the Assuan Dam permit the floods to pass without entrapping the burden of sediment so valuable to Egypt. The dam stores the last part of the floods, that part which is most free from silt, and raises the level of water to the canals. There are 3,000,000 acres irrigable from the dam, though only a million acres are included in the present development. Further developments depend on storage in Lake Tsana in Abyssinia or on the White Nile. In 1924 a part of the first unit of 300,000 acres was being ditched and prepared for water. The first crops of importance were grown in 1925.

Other projects are planned for the Upper Nile. A small project near Kassala, on the River Gash southeast of

Australia is making notable irrigation progress. This is a scene on the Morrumbridge Irrigation Scheme in the Antipodes. (Photograph by Courtesy of the Bucyrus Company.)

Khartoum, had 15,000 acres planted to cotton in 1924. This area is said to be capable of extension to 100,000 acres. On the White Nile reservoirs have been planned to supplement the water supply of Egypt, and Lake Albert in Equatorial Africa is to be controlled. A million acres of new land can be made available for crops and another million acres now producing one crop will be provided with water for irrigation the year 'round. Areas along the White Nile and in the valley between Khartoum and the Assuan dam may receive water from these new storage reservoirs. All of these plans are centered more or less around the production of cotton.

IN INDIA the Lloyd Barrage, at Sukur on the Indus, has been completed. This structure is one of the largest weir dams in the world. It is designed to raise the level of low water to canal height and to pass 1,500,000 second feet in flood. The canals command 7,500,000 acres, of which 6,000,000 are irrigable. Annual irrigation of 5,000,000 acres, of which 2,000,000 have heretofore received a partial supply, is expected. Canals of discharge of 30,000 second feet are to be built from this weir.

This area lies in the Sind, the hot lowland area of Western India. The soil is described as "black cotton soil," a description which gives a clue to the hopes of the planners of the enterprise. Native population already fills the country and will expand to take up all of the new lands brought into cultivation, for all that is necessary in an Oriental country such as India is to increase the food supply and the population automatically increases. Food crops will be the first consideration but the money crop will be cotton.

The Lloyd Barrage is not the only new irrigation project in India. Others smaller in scope are receiving attention and together they make up a considerable area.

NEARLY a hundred years of development of irrigation in British India have demonstrated that returns from irrigation are regular and profitable. Famine has been almost eliminated and the irrigated areas now produce an excess of certain products, among them cotton, for export. Important irrigation enterprises, such as the Lloyd Barrage, will come into profitable use more rapidly than was the case with the earlier works. In 1920, $80,000,000 had been invested in perennial canals in Punjab. In that year the profit above interest charges was 12 1-2 per cent of the capital expenditures. Other canals have returned much higher rates of interest.

One of the most interesting propositions emanating from England's irrigation geniuses is that of Sir William Willcocks to "re-create Chaldea." Fifteen year ago Willcocks made a study of the remains of irrigation works in the valley of the Tigris and Euphrates rivers and reported that "ten million acres once as fertile as a garden" could be put back in cultivation. The whole area is not cultivable at one time, as the water supply is not great enough, but he predicted that 7,000,000 acres could be supplied with water for winter crops. 1,000,000 acres for rice, and 3,000,000 for summer crops (among which cotton is mentioned). The region at the time of Sir William Willcocks' survey was ruled by Turkey. Since the war it has been under the control of England—the mandate of Iraq.

Unsettled political conditions have not permitted the carrying out of the plans to increase the irrigated area, but we may expect to see the lower valley of these streams once more the granary of the east unless there is some break in the friendly relations among the nations of the world. Grain will, however, not be as important as it was in the days of Babylon, for with modern transportation the irrigators will find that they can grow an acre of cotton and with the crop buy the product of several acres of wheat or corn grown in the temperate zone. A few years under the control of a peace-loving people such as the English and we will once more see the valleys of old Mesopotamia as "fertile as a garden."

THE irrigation activities of the British Empire are not confined to the countries of dark skinned people. Canada, Australia and South Africa are all interested in extension of irrigation. We find in these countries, however, much the same conditions as are found in the United States—financial troubles and the necessity of colonization attended with indifferent success in the first years. When we look into the reason for the difference in the conditions, it is at once apparent that a very different method of financing has been used. In the case of the Oriental and African irrigation developments, the cost of the irrigation works is a governmental expense and there is no attempt to collect the capital expenditure from the water user. Taxes are raised from the land user and from all of the taxable properties and industries which grow up with irrigation. The taxes are graded to the ability of the irrigator to pay, light at first and increasing in later years.

In the countries where the population is white, the method of financing which has been followed almost uniformly is to sell the land and the water right to the water user. In the period during which the right is being paid for, the user of water has the cost of maintenance and the installments on the construction cost to pay. Thus at the time when the land is new and the agricultural industries imperfectly organized, the farmer is called on to pay heavy charges. In Egypt, for an instance of the system in the Eastern countries, all costs of operation and support of the country are raised from taxes on the irrigated land. Where so large a part of irrigation works has been built for many years, there is no interest to pay on bonds and the settler has only the upkeep and operation charges in his tax bill.

Interest in the extension of irrigation facilities is not confined only to the countries under British rule. The

When the Solons *Took Off* Their *Coats* and Went After the *Facts*

Senate Committee Studies Colorado River Problem at First Hand

By CARLETON D. JOY

Hiram and Key (Senators Johnson and Pittman) sans coats, vests and some of their senatorial dignity.

MAJESTIC canyon walls, towering above the turbid waters of a mighty river, are a more potent argument to spur the determination of men bent upon building empires in desert wastes than volumes of logically compiled data, spread out on committee tables by corps of engineers.

Two years of congressional committee hearings in Washington—in which experts who have studied the lower Colorado River have repeatedly testified that the west must store the wealth of this great national resource—failed to bring forth a show of enthusiasm comparable to that which followed the half day's trip into Black Canyon by the senatorial committee on Irrigation and Reclamation early in November.

TEN United States senators, members of this committee, called upon their full powers of oratory to declaim upon the future that is the west's as the result of stored waters in these same canyons; and vied with one another in word pictures of the great dam that is contemplated.

In the shadow of those towering granite walls at Black Canyon, between Arizona and Nevada, a vision of a huge concrete wall behind which millions of acre feet of water may be impounded, came nearer joining hitherto uncompromising interests in a common project than all the argument, compacts, conferences and testimony devoted to development in the Colorado had ever done. The west may rightfully be optimistic about future reclamation of its deserts and hydro-power.

One might safely say that three major, all-important considerations crystallized in the hearings before the Senate Committee at Los Angeles, San Diego, El Centro, Yuma, Phoenix and Las Vegas during the last week of October and the first week of November. Those considerations are: Construction of a high storage dam at Black Canyon to impound 26,000,000 to 34,000,000 acre feet of water in the Boulder Canyon reservoir as the initial step in a super-plan that will ultimately develop the entire Colorado River; provision that American lands alone will be benefited by this project and that Mexican lands must shift for themselves; formulation of an interstate agreement in which all the states in the Colorado basin arrive at a settlement of the differences which now divide them.

AT LAS VEGAS, on the eve of adjournment of the committee sessions, there was a strong note of optimism expressed by each of the senators in turn as each briefly summarized his views gained in the tour of the southwest. And in each instance there was the admonition, directed particularly to California, Arizona and Nevada, to work out some agreement with which to approach the upper basin states so that the west will stand as a unit for development of its water resources.

From Senator Phipps of Colorado, Senator Kendrick of Wyoming, Senators McNary of Oregon and Jones of Washington the same declaration was repeated: namely, that the west has it within its power to develop the Colorado through the federal government. Whether the approaching sessions of Congress will witness the passage of some definite legislative measure in accordance with these conclusions is conjectural; and even the most ardent advocates of the Swing-Johnson bill in the Senate Committee would not prophecy as to its fate. One thing, however, is certain. Congress will hear from the west in the most graphic and convincing language that these able men can bring to their aid. Washington will be the scene of a great campaign for irrigation and power this winter.

The senators as they boarded the special train that took them thirty miles into Mexican territory to study the lower river. Left to right: Senators Phipps of Colorado, Ashurst of Arizona, Pittman of Nevada, Shortridge of California, McNary of Oregon, Kendrick of Wyoming, Oddie of Nevada, Johnson of California, Jones of Washington, Dill of Washington and Cameron of Arizona.

Spillway of Pit No. 3 Dam of Pacific Gas and Electric Company on Pit River, California—a typical example of great power projects under permit from the California Division of Water Rights.

Water Developments Depend on Valid Rights and Titles

By EVERETT N. BRYAN

Deputy Chief, Division of Water Rights, California State Department of Public Works

THE RAPID development of a state's water resources is dependent, in large degree, upon the readiness with which water titles may be established. This is especially true in California. It is estimated that there are still, in this one western state, some 12,000,000[1] acres of agricutural land to be brought under irrigation and 5,200,000[2] potential hydroelectric horsepower to be developed. More than two and one-half billion dollars will be required for these two classes of water developments alone; and, in addition, there is the capital required for mining, municipal, and domestic water supply developments. This tremendous amount of capital will become available only when and as title to the use of the necessary water is established and made secure.

California is confronted with a peculiar situation in the matter of water rights because of the two conflicting doctrines by which titles are derived. Under one doctrine the right to use the water flowing in a stream is inherent in the land which borders the stream and dependent purely upon land ownership. The right is neither created by use nor forfeited by dis-use. It is limited to the watershed through which the stream flows but recognizes no tenet of priority. This is the doctrine of riparian right. It is derived from the common law of England, which by statute of April 13, 1850, was adopted as the rule of decision in all courts of the state insofar as not repugnant to or inconsistent with the constitution of the United States and the constitution or laws of California. The decision of Lux vs. Haggin (69 Cal. 255) in 1886 firmly fixed this doctrine upon California as one which must be reckoned with in determining water titles.

OPPOSED to this we have the doctrine of appropriation which was born of the necessity of the miners before California was admitted to statehood. It is based upon use, is forfeited by non-use, is independent of any natural contact with the source or the watershed from which diversion is made, is independent of land ownership, and recognizes that "first in time is first in right." This doctrine was recognized from the earliest mining days but was first incorporated in the laws of California in 1872 by the adoption of Civil Code Sections 1410 to 1422, which sections were later superseded by the adoption of the present Water Commission Act (Chapt. 586, Stats. 1913).

The development of California's water resources has proceeded now for 75 years under these two opposing and irreconcilable doctrines. There are no accurate figures as to what percentage of the total development may be claimed by either, but it has been estimated that only one-sixth[3] of the irrigation development has proceeded under claim of riparian right. Since 1860 there have been some 700 supreme and appellate court decisions on water matters and most of these are traceable to the conflict between these two opposing doctrines.

In order to eliminate some of this difficulty, Section 11, Chapter 586, Statutes of 1913, was enacted by the legislature of California in 1913. This statute in part provides that ten consecutive years non-use of water upon riparian lands shall constitute conclusive presumption that the water not used is not needed upon the riparian lands and that it shall accordingly become subject to appropriation. There are those who maintain that this provision is unconstitutional, but it probably is a safe assumption that by far the greater part of California's future development of water resources will proceed under the doctrine of appropriation rather than the doctrine of riparian right. The simpler developments which border the stream are for the most part already accomplished. The developments of the future will, in the main, be of greater magnitude and involve the transportation of water to non-riparian lands.

The Water Commission Act, enacted in 1913, with subsequent amendments, gave California for the first time a complete water code. It provided the means whereby appropriative rights could be initiated, adjudications and determinations of existing rights could be undertaken by impartial experts, and stream systems could be administered in accordance with the determined rights. Were it not for the conflicting doctrine of riparian right and the

Congressman Smith on Reclamation

It is our obvious duty to render possible the acquisition of lands and homes by our citizens through reclamation.

The west must sell reclamation to the entire country. It should undertake a campaign of national publicity.

To do this successfully it must abandon projects which are merely local and concentrate on plans national in scope.

The passage of the Smith-McNary bill by Congress would be assured if it were backed by the states most interested.

Reclamation has not been a failure. It has been a great economic success in spite of isolated examples of failure.

Increasing population, abandonment of a million acres of eastern crop lands yearly, and our dependence on other nations for food supplies indicates a need for extended reclamation.

Co-operative marketing is a logical development to accompany extended reclamation. Congress will probably enlarge the co-operative work of the Division of Co-operation.

Thoughts on Reclamation as the 69th Congress Meets

By ADDISON T. SMITH

Representative in Congress from Idaho

Chairman, House Committee on Irrigation and Reclamation

THESE are the underlying reasons why the federal government is and should be concerned in reclamation. There is no greater stability in government than the security which the individual feels in the acquisition of lands and home. Home-owning and land-holding typify a higher standard of citizenship and give a clearer vision and understanding of our institutions.

The inevitable increase in our population foreshadows the hour when the Nation must give thoughtful consideration to the problem of distributing its people. The permanence of our institutions can not be safeguarded if we disregard our obvious duty to render possible the acquirement of homes by our citizens. It is the blending of the virgin, fertile soil of the arid lands of the west with the water from its ever-flowing streams that eventually will reclaim these lands—20,000,000 acres of them—and transform a desert empire, dotting this great area with substantial farm homes and squared fields of pastoral grandeur.

WE OF THE WEST have a most important duty to perform, and that is to sell reclamation to the whole country. There should be a unified effort on the part of the west to initiate a campaign of publicity to educate all the people to an appreciation of the material benefits which flow from this work.

In order to do this successfully we shall have to disregard local projects for the time being and concentrate on plans national in scope. In other words, California must indicate the same reciprocal spirit of interest in the demands of Georgia, Alabama and other states for recognition in the federal policy as she expects to be shown for her own projects.

It must not be forgotten that national reclamation became a definite policy of the government not wholly by reason of western effort. The passage of the present law was due in part to the generous support of the south, and some of the manufacturing centers of the east. For this reason the west is bound to give consideration to the interests of these sections in all propositions looking to an expansion of land reclamation and development.

MANY PEOPLE concerned in the extension of reclamation are interested in the Smith-McNary bill, drawn after careful consideration of the demands of many states. There are many available projects in the west and south awaiting the co-operation of the federal and state governments toward their reclamation, most of which would be able to meet the conditions which that measure would impose.

If the Smith-McNary bill were enacted into law, it would launch a nationwide program of home-making on a self-sustaining and self-continuing basis with benefits widely distributed. Its approval by Congress would be assured quickly if it were backed by the states in which the opportunities are greatest for its application.

Organizations for carrying on this educational work should be developed in all the states. The greatest effort should be concentrated upon a broad and definite policy that would be forward-looking, practical and thoroughly businesslike.

As expenditures under the policy contemplated by this bill are reimbursable, no taint of petty politics can attach to it; rigidly supervised by practical engineers of experience, each project would stand upon its own merits.

Such a policy would secure prompt and favorable consideration from Congress, where local measures would not, if it were properly presented to Congress and strongly endorsed by the public. It would contribute greatly, when put into effect, to the welfare of the whole country.

THE QUESTION is being seriously put: "Is reclamation a failure?" The reclamation policy of the government, adopted in 1902, has been a great economic *success,* regardless of the unfavorable criticism which has grown out of the failure of settlers on some of the projects to meet their obligations promptly. Nearly 3,000,000 acres of desert land have been transformed into approximately a billion dollars worth of national wealth, bringing to the counties, states and federal government millions of dollars annually in taxes. Near-

(Continued on Page 53)

Because of the difficulty of finding a market, much power that might easily be developed is wasted in unharnessed water. These penstock openings in the Elephant Butte Dam, New Mexico, are symbolic of the potential but unused power that remains to be efficiently utilized from present irrigation developments.

Electric *Power* and *Water* for Irrigation are *First Cousins*

But There Are Some Puzzling Problems Involved in Making Them Pull Together Efficiently

By IRVING C. HARRIS
Consulting Engineer

IT IS very natural that irrigation and hydro-electric power should be closely associated; for the reason that electric power is involved, in one way or another, with a very large proportion of all irrigation enterprises.

Many irrigation projects require power for pumping water from wells, from streams, or from one canal to another. Others require it for pumping drainage water, either from wells or from drains. A considerable number of irrigation projects are, or possibly may become, producers of hydro-electric power as a by-product.

Though closely associated, irrigation and hydro-electric power usually have peculiarities that are decidedly difficult to harmonize. It is well known that irrigation is seasonal, and calls for the use of water in amounts which gradually increase from nothing, or almost nothing, during the early months of the year, to a maximum during the summer months, and then decrease to nothing, or almost nothing, during the last months of the year. The average rate of use for the entire year is always less than half the maximum rate.

POWER applied to pumping irrigation water, and hydro-electric power generated as a by-product at storage reservoirs,—built for irrigation,—must have this same characteristic fluctuation throughout the year, except in a few cases where special provisions have been made to eliminate them.

The ordinary uses to which hydro-electric power is applied call for power at times of the year that are very different from the times of similar demand, or available supply, on irrigation projects. For instance, most power companies sell large portions of their output for electric lighting, heating, cooking, electric railways and industrial uses; and they most commonly experience their period of maximum demand,—or peak load,—in the winter instead of in midsummer. Thus the two are as nearly opposite, as regards distribution of use throughout the year, as it is possible to be.

On an irrigation project which has by-product power, either developed or potential, at storage reservoirs, irrigation is usually the primary object and power secondary; for the reason that the products obtained from the use of a given amount of water used for irrigation bring a much higher money return than the sale of power generated from the same amount of water. This establishes the general rule that it is not desirable to use stored water to generate power when such use will decrease the amount available for irrigation.

AS A CONSEQUENCE, the utilization of this by-product power requires the finding of a market, or a method of disposal of the power, which can adapt itself to the very special characteristics of the supply. Except in special cases, this requires stand-by plants or other methods of compensating for the shortage of power during the non-irrigation season.

It sometimes happens that by-product power of this kind can be sold to other irrigation projects that use power for pumping their water supplies. This makes a mutually satisfactory arrangement, because such projects naturally irrigate at substantially the same times as the one generating the power.

The Salt River project, in Arizona, is the most conspicuous example of a project that involves irrigation and by-product hydro-electric power; and it includes about every set of conditions that can be encountered.

During the earlier years of the Salt River power system, its power output had the peculiar characteristics above described; but it was possible to dispose of the entire output. One mining company has used more than one-half of the output of the five plants. This company has its own steam power plant and generates a part of its power all of the time, and a larger part, or all of it, when the output of the Salt River system is reduced. Certain special problems encountered by the mining company were greatly helped by this arrangement; and the two sets of peculiar conditions fitted together in a manner that materially helped to solve the problems that confronted both parties.

The Salt River project itself is a large user of its own power for pumping from wells, for drainage and for additional water supply, and, also, for pumping from a canal to a highline canal. There are several irrigation projects adjacent to the Salt River project that use water pumped from wells. As their demands for water, and, consequently, power, coincide very closely with the output of power on the Salt River System in point of time, they purchase their power on mutually beneficial contracts.

A LIMITED AMOUNT of power is sold by the Salt River Project to power companies and municipalities that use it for lighting and general power purposes. The largest user of this class maintains its own steam reserve. There have been times when power generated in customer's reserve steam plants has been purchased by the Salt River Project

for its own uses, or for serving other consumers not supplied with reserve, during periods of power shortage.

The Salt River power system has been so successful that the project is now proceeding with an enlargement program which was always contemplated as an ultimate development of the power system, but not previously promoted because the time was not ripe. This involves the building of a regulating reservoir at Mormon Flat, now completed, and a high dam and power plant, now being built, at Horse Mesa, between Mormon Flat and Roosevelt.

The completion of these reservoirs and plants will make it possible to hold over, in the Mormon Flat Reservoir, water that is used by the Roosevelt and Horse Mesa power plants for power purposes when not required for irrigation. This makes it possible to generate power continuously without waste of irrigation water, and largely removes the peculiarities of this kind of by-product power.

THE Rio Grande Project has a large potential power site at the Elephant Butte Dam, in New Mexico, which has not been developed for the reason that it has not yet been possible to secure a market for the power on account of its lack of continuity. It is probable that a market will be developed within a short time and the proposed power system built. A regulating reservoir, similar to the one built on the Salt River Project, is being considered and will possibly be the means of eliminating the handicap which has prevented development thus far.

There are a number of irrigation projects in California, either constructed, being built, or proposed, that involve large storage reservoirs and power sites which have characteristics very similar to those described above. In some cases, the disposal of their by-product power is best accomplished by selling the output at wholesale to large power companies who are able to absorb it into their large systems in spite of its peculiarities.

Many of the hydro-electric plants operated in California by the power companies use water from streams that are not controlled by reservoirs. The water usually belongs to irrigators below the plants, and must be so used as not to disturb its natural flow or interfere with irrigation. In such cases the output of power has a distribution throughout the year that is different from enterprises that have storage reservoirs; and it is generally characterized by a reduction in the output, especially in dry seasons, during the late summer, or at approximately the same time that a project having storage has its greatest output. For this reason, the power companies having such plants should be able to absorb by-product power from storage projects quite advantageously.

The Modesto and Turlock irrigation projects have worked out their power disposition problem and are operating a power plant at the Don Pedro Dam. The Merced Irrigation District has financed and is building a power plant at the Exchequer Dam which will deliver its power to one of the large power companies.

In Arizona, Salt River water does double duty. It first generates electrical energy and then irrigates the desert soils, while the power which it has created passes through substations like this one on the Litchfield Ranch of the Southwest Cotton Company, to pump water from wells to irrigate other lands.

An up-stream view of the Roosevelt Dam, which supplies power for the Salt River Valley Project, which is, perhaps, the most conspicuous example of how power and irrigation may be made to work together for reclaimed territory.

MANY of the large storage reservoirs built by the United States Reclamation Service, including the Pathfinder, Shoshone, Arrowrock and others, have large potential power sites which have not been developed because of the seasonal characteristics and lack of market.

The irrigation and power possibilities of the Colorado River are so enormous that the peculiar characteristics described above, though present, will have little effect, and are partly counterbalanced by other conditions. The magnitude, distance from the market, and diversity and conflict of interests, are the problems that have to be solved.

Assuming a power plant to be built at a storage reservoir at the Boulder Canyon site, capable of regulating the entire river, and that the water is to be released from this reservoir only as needed for irrigation of the lands below it, the power output would be similar in distribution to that at the Roosevelt and Elephant Butte reservoirs, without regulating reservoirs below them. However, since it will be a long time before all of the water can possibly be applied to irrigation, there will be, for many years, an excess of water that can be discharged from the reservoir at will to suit power demands and flood regulation without disturbing irrigation.

TO SERVE best for flood protection of the Imperial Valley, the flow of the Colorado River below Yuma should be kept nearly constant. This will suit the requirements for general power purposes very well and, also, the demands for irrigation as long as the peak demands can be met by such regulation. When the time arrives, many years in the future, when all of the water will be needed for irrigation, the irrigation interests will demand that the flow below the last reservoir on the river be regulated to suit irrigation.

(*Continued on Page 44*)

Credit is Your Most Valuable *Asset*

This Article Suggests Means By Which It May be Established and Maintained

By B. J. SEGER

Secretary-Treasurer of the North Platte Valley Water Users Association and the Farmers Irrigation District, Scottsbluff, Nebraska.

WHEN irrigation in the United States was young and there were but few irrigation systems and a comparatively small acreage under irrigation, the financing of the projects was not so important as it is now. In those days the large individual land owners constructed the small projects, if there were no special engineering problems involved, and also did a great deal of the operative and maintainance work. The land owner, as a rule, donated his work and if other labor was employed and materials purchased, warrants having no maturity date were issued in payment. These warrants were usually sold to the local bank or to some individual, and, as a rule, were discounted from 5 to 15 per cent.

Now that larger canal systems have been built and many more are in the course of construction ,some of which require millions to complete and many thousands per year to operate and maintain, the matttr of financing irrigation projects, especially those of considerable size, has become correspondingly more important. It is, therefore, more necessary that the matter of credit for irrigation projects be given serious consideration.

The irrigation district form of organization seems to be adopted by the greater number of irrigation projects. Especially is this true on the larger projects which have been organized in recent years.

CALIFORNIA enacted the first irrigation district law in the year 1887, known as the "Wright Act." Other states have enacted similar legislation with some modifications, but in the main the provisions of irrigation district laws are the same today.

The advantage of an irrigation district form of organization is that each acre of irrigable land must bear its proportionate share of the tax levied for the building of the project and for its yearly operation and maintenance. Bonds may be issued and sold to secure funds to pay for the construction of the canal system, and for making additional improvements. The irrigation tax as a rule is collected along with the state, county and school taxes.

A common mistake made by directors of newly formed irrigation districts is in not making sufficient levy in the first years to allow for delinquent taxes, with the result that sufficient funds are not collected to meet interest coupons and other obligations when due. Unless provision is made the following year to make up such deficiency, and due allowance made to avoid a similar shortage, the credit of such districts will become impaired and it will require several years of careful management to re-establish it.

AN IRRIGATION district which pays its obligations promptly when due can secure a better price for its securities than a district which issues warrants and allows them to run for years before being paid, or which allows other forms of indebtedness to drag for an indefinite period. There is no reason why irrigation securities should not sell on a par with other securities if some provision is made for the protection of the purchaser from loss.

The time is past when a dishonest promoter can build an irrigation project having little or no water supply, and sell the lands and the securities of the project to the unsuspecting public. Practically every state having irrigated territory now has laws which make it impossible for such frauds to be perpetrated.

Investors are learning that irrigation securities are as safe as any investments, provided a thorough investigation, made by an expert on irrigated lands and finance, shows the following facts:

1. A large per cent of first and second class land which is capable of producing large yields under good farming methods.
2. An ample supply of water for the land to be irrigated and an unquestioned water right granted by the state.
3. At least 75 per cent of the irrigable lands being farmed by resident farmers.
4. A reasonably close market for the marketing of the products of the lands.
5. The class, financial condition and number of people living on the project.
6. A bonded debt which is not excessive.

SOME of the larger districts, through their directors and officers, handle either directly or indirectly as much money during the year as a bank or a large business institution.

In order that the credit of an irrigation district be placed on a firm foundation, it is important that the landowners of the district shall select men to represent them on the direcorate who will take a real interest in the business affairs of the district—men who will realize the responsibility placed upon them to the extent that they will use as much care and judgment in looking after the business of the district as they do in their personal affairs.

If the members of a district board are busy men—too busy to give the affairs of the district sufficient time and attention—they should employ a business manager to manage the finances of the district and other important details.

Where there are a number of small irrigation projects in the same territory, it might be feasible to employ a business manager to handle the finances and other business of several projects. Many districts get into bad condition financially through neglect, while if the business of the district were handled by an experienced business manager, the credit of such districts could be kept in first class condition.

It is an established fact that those projects having at least one of their officials a man of business experience, especially in irrigation finance, to handle the finances of the district, have no difficulty in selling their securities at a good figure, or in borrowing funds when emergency arises which would make this necessary.

LANDOWNERS under a project should be made to realize that they are the organization and that they have an important part in helping officials to maintain the credit of the district. There should be closer cooperation between the officials of an irrigation district and the landowners. No matter how competent and efficient the officials may be, if the landowners do not cooperate in every way possible, the dis-

Machinery Replacing *Pick* and *Shovel*

Mechanical Equipment for Trench Digging, Pipe-Laying and Back-Filling Described

By THOMAS BROOKS

Superintendent in Charge of Domestic Distribution and Supply, Bureau of Water Works and Supply, City of Los Angeles.

PREVIOUS to the World War the Bureau of Water Works & Supply of the City of Los Angeles had given very little thought to the use of mechanical equipment for the excavation of trenches, the laying of pipe and backfilling of trenches. Up to that time there was a plentiful supply of efficient labor at wages which were very reasonable from the employer's standpoint. The war, however, was the cause of a great change in this respect. During that interval and almost up to the present time efficient labor for trenching and pipe laying was not available; which will explain in part why the Bureau is now so well equipped with mechanical apparatus for handling this class of work. Economy is another important factor worthy of consideration, as a result of the change from the old to the more modern methods.

Phenomenal growth of Los Angeles during the last three years, necessitating the extension of our mains to supply new subdivisions being put on the market, required the installation of from 75,000 to 140,000 feet of pipe per month; and in addition to the large volume of trunklines and betterments it became absolutely necessary, in order to meet the growing demand for water, to speed up our work in every way possible. By introducing modern mechanical equipment we have been able to meet this condition very satisfactorily.

AT PRESENT we have a fleet of seven pipe trenching machines, two in the San Fernando Valley and five for the city proper,—of these four are the "P & H" and two the "Buckeye" wheel type excavators, for excavating trenches from 18 inches to 21 inches in width and approximately 7 feet in depth; one ladder type "Buckeye" machine for excavating trenches from 24 inches to 42 inches in width and approximately 8 feet in depth.

In new tracts, where there are no obstructions, the small machines will dig a trench from 2500 to 3600 lineal feet in eight hours at a cost for operation, helper and fuel of approximately $18.00, the average depth of trench being 3½ feet. The large excavators are capable of digging a trench 42 inches in width and 5½ feet in depth and a length of from 500 to 1500 feet in eight hours at a cost (not including upkeep or depreciation or overhead) of about $25.00.

On account of the time consumed in moving the machines from job to job and the delay occasioned by break-downs, the average footage of trench excavated per machine for a period of several months would be very much less than the figures above quoted. As to depreciation, the oldest piece of equipment of our present fleet has been in active service for five years and I feel sure it is good for at least two years more. Four of the wheel type machines over a period of eight months dug a combined total footage of 549,446 feet of trench varying from 18 inches by 3 feet to 21 inches by 4 feet, at a cost per lineal foot, including gasoline, cylinder oil, repair material, repair labor, operator, moving expenses, and overhead, of five cents per foot. Our ladder type machine dug 100,000 lineal feet of trench, ranging from 31 inches by 4½ feet to 42 inches by 5½ feet, at a total cost (depreciation not considered) of six cents per foot. The Department has a twenty-ton low trailer for moving the wheel type excavators from job to job.

BACKFILLING of trenches is done by two Holt push-blade backfillers, and two P & H trench backfillers. The Holt machines will backfill an 18-inch by 3-feet trench at the rate of from six to eight thousand lineal feet per eight-hour day. This is considered a very economic and reliable machine. For backfilling trenches 24 inches and up we use the P & H backfillers with or without the boom. With the boom attachment one operator can backfill from five hundred to seven hundred feet of 36-inch trench per eight-hour day. These machines are moved from job to job on one of our large trucks or on a twenty-ton capacity trailer. For digging bell holes in hardpan or sandstone we have quite a number of pneumatic spades which are also very useful for tunneling below railway and other structures. One spade will accomplish the work of about four laborers working with picks.

For cutting concrete pavement the Department has several pneumatic concrete breakers. This method of breaking concrete is such an improvement over the old method of gad and sledge that there is no comparison between them.

Compressed air for caulking lead joints, filed riveting of sheet steel mains, driving the pneumatic spades, concrete breakers, cutting cement joints from cast iron pipe and for a multitude of other purposes is furnished by three Ingersoll-Rand Compressors each having a capacity of 212 cubic feet of air per minute and mounted on 2½-ton capacity trucks.

For lowering and placing in the trench, cast iron pipe of the larger diameters (i.e., 20-inch, 24-inch, 30-inch and up) and for handling large valves and fittings, we are using an "O & S" Truck-Crane mounted on a five-ton capacity truck; and after using this crane continuously for several months handling 24-inch Class "C" cast iron pipe, I have found it to be satisfactory in every respect and I can highly recommend a crane of this type. We also have a smaller truck-crane for handling loads of one-ton and less. For unloading pipe from cars and loading trucks at our pipe yards, the Department has one "P & H" and one Brownhoist Crawler tread-type forty-foot boom crane. It would be almost impossible for the Department to handle the large tonnage of cast iron pipe received without the aid of these cranes, which have proved to be all that is claimed for them by the respective manufacturers.

FOR TRENCH PUMPS we have one nine-hundred gallon-per-minute centrifugal pump, mounted on a four-ton truck, together with a generator for furnishing current to a large number of electric lights for night work; in addition to the pump and generator this truck also carries a 178-cubic-foot-per-minute air compressor. All of the above equipment is operated by the truck motor.

For handling smaller quantities of water, four power driven diaphragm pumps are used, mounted on small rubber tired trailers, which are good for 12,000 gallons per hour each. We also have an electric driven emergency trench pump and lighting plant mounted on a

VOL. I DECEMBER, 1925 No. 6

Water for the World

THE WHOLE WORLD is interested in irrigation. The remotest parts of the globe are transforming their arid lands into garden spots by the intelligent use of water. In Egypt and India, in Spain and Italy, in Australia and Mesopotamia, there has been renewed interest in the construction of works for the development and distribution of water since the end of the great war.

As a matter of fact, there are many indications that America itself is being outstripped in the irrigation race. Egypt and India, where irrigation was practiced in remote historic times, are now, in the twentieth century, under the progressive colonial policy of the British, bidding fair to assume the leadership in irrigation activities once more.

In many other countries of the world, and particularly in British colonies and dependencies, constructive endeavors looking far into the future are in progress. In the United States such progress as is being made is very slow, considered from the perspective of the entire nation. We seem, according to one qualified authority, to be suffering from an aggravated case of "inferiority complex" in our confidence in the necessity for and the value of irrigation progress, and, after leading the world for twenty years in the extent of irrigation development and boldness of engineering skill, "we now sit supinely by and watch with half-hearted interest the evidence of progress in other countries." Soon we may again be sending our engineers to foreign countries to learn how these things are done, just as we did twenty years ago.

And yet there is no other nation that has the opportunity that is the United States' to maintain a recognized leadership. And there is no other continent that offers such a field for development as does North America.

In an article in this issue, an eminent irrigation engineer presents a broad survey of some of the most significant developments taking place in the four quarters of the globe. It is worth reading for many reasons, but perhaps most of all for the realization which it brings that we must bestir ourselves if we would maintain our "place in the sun" of peaceful, constructive and beneficent development.

A Factor in World Politics

IN THIS ARTICLE, irrigation is presented as more than a matter of engineering and economics. It is becoming a great factor of international politics. The statesmen of Great Britain are still looking out from Downing Street at an Empire which they would make self-supporting and self-dependent. The control of staple crops is essential to that dream's realization, and cotton assumes a dominant role in the plan. They are not content to be dependent on any nation—not even friendly and peaceable America—for their supply of this essential raw material, and by the construction of great irrigation works they are seeking to create a cotton producing empire in their colonies that will assure them of an adequate supply for their own factories.

The extension of the irrigated territory of the colonies for this purpose has long been contemplated, but several factors combine to make it possible today where before it was not. The high price of cotton is the greatest factor, but that unswerving determination to carry forward public works in the British dependencies is another important one. Larger sums of money than ever before have been set aside for public works. The incredibly enormous amounts expended in the conduct of the war have not proved a deterrent, but have rather proved a stimulus to such development. The few millions of dollars required for irrigation, to increase the land resources of the empire, to give it new and larger crops, and to put it in a strategic position for self-support and self-defence, seem insignificant alongside of the billions prodigally provided for the wasteful, futile use of war.

Peaceful Imperialism

THE SENNAR DAM, which will make 3,000,000 acres irrigable, is only one of the projects under-

POINT *Of* VIEW

taken by the far-seeing English for the express purpose of growing cotton and securing freedom from the dominance of the American grower. Part of the plan of this project is to keep, for the production of cotton, one-third of the area thrown open to agriculture by its completion. Definite plans are already under way for the irrigation of a million acres under this one project, and enough is known of the possibilities of storing water in the lakes of Abyssinia to assure at some future time the extension of this area to the full limit of three million acres.

Irrigation thus assumes the key position in international politics, ranking with the control of the oil fields of the world, or the possession of the great coal and ore deposits, as the *sine qua non* of world power. But there is this difference —every acre of new irrigated land is an achievement, first, in the direction of peace, rather than war, for it opens the way for an expanding, home-keeping population. And there is this other difference—the nations may struggle over their rival claims to Alsace-Lorraine, or the oil fields of Mesopotamia, but each one can find within its own boundaries or that of its colonies ample room for the peaceful imperialism of irrigation.

This Man Work

HUBERT WORK, Secretary of the Interior, must be eminently satisfied with things in general if he agrees with the famous dictum that it makes no difference what people say about one if they only say something. For both his friends and his critics find him an absorbing subject for discussion.

Recent editorial utterances in national journals as far removed in purpose and policies as the *Outlook* and the *New Republic* have recently taken occasion to commend Secretary Work's administration of the Interior Department, and to approve particularly his policy of reclamation. The *New Republic* sees in his frank statements and forthright attitude toward the problems of the Bureau an indication that reclamation is to be put upon a business basis, free from the pork-barrel tactics which in many cases have been a blot on federal aid projects of various kinds in the west. The *Outlook* declares:

"It is useless to cry over spilled milk—or wasted water. What has been unwisely done can not now be undone. Much of it can be abandoned, and the cost charged to experience, or politics, or profit and loss, or what you will. Some of it can be bettered by the spending of more money. Most of all, the repetition of those errors can be avoided if Congress will have the sense and take the time to change the Reclamation laws. No time need be spent in finding out what needs to be done. That has been very well found out by the fact-finding committee appointed by Secretary Work. . . . .

"Their report is unanimous. It has lain in the archives of the Senate for a year and a half. It will stay there unnoticed for a century and a half unless the people . . . wake Congress up to their duty . . . . If it will, Congress can reclaim Reclamation."

The Other Side

LOOKING at the other side of the strange case of Dr. Work, "Uncle Henry," in *Colliers*, expresses in characteristic fashion the criticism which is often heard among reclamationists who disagree with the present administration. "Uncle Henry" is not always kind in his comments, and occasionally sacrifices fairness to humor, but his reference to the qualifications of Secretary Work is good fun even if it is not good argument. He says:

"An' consider the case of Doc Work, now holdin' down the chair which Albert Fall was kind enough to leave behind. When Hubert, as a youth, decided that he wanted to be Secretary of the Interior he didn't make the mistake of travelin' through the West, familiarizin' himself with irrigation, timber lands, coal an' oil, grazin' ranges an' the moods of mountain sheep. Not on your life! He took up medicine, cultivated a bedside manner an' refused surgical cases so's people wouldn't associate him with the Interior Department. An' look how it worked out.

" 'Who's that man I see goin' by the house every day with a black satchel?' asked the President one mornin'. 'Looks like he ought to make a good Secretary of the Interior.'

" 'Oh, him!' answered one of the confidential clerks. 'Why, that's Good Old Doctor Work. Thirty years' experience an' never used the knife.'

" 'Too bad!' The President shook his head disappointedly. 'I thought he was a piano tuner. Oh, well, I reckon a doctor's jes' as good. Make out the appointment.'"

Those who disagree most widely with Secretary Work's policies voice the assertion that he was put into office for the purpose of discrediting reclamation. Some of the bitterest criticism against him comes from Republican members of Congress. "An attempt will be made," says Senator McNary, speaking of the coming session of Congress, "to ascertain from the Secretary why he has not worked upon the project heretofore authorized by Congress, and why he has left a story of sadness in all his speeches on irrigation."

In the meanwhile, the annual report of the Bureau of Reclamation, submitted in December, indicates substantial progress toward the correction of past mistakes in the fiscal policies of the department and the rehabilitation of the whole service. And Secretary Work himself, in a recent public statement, declares: "Both the Secretary of the Interior and the Commissioner of Reclamation have faith in reclamation by the government and are committed to its development, and determined to eliminate weakness in its policies and past practices."

Lawyers and Irrigationists Hold Varying Opinions on Pending Herminghaus Case

Statements on Involved Issues Quoted From Advocates of Both Sides and Neutral Sources

"NO SET of issues was ever more grossly misrepresented," declares John W. Preston, San Francisco attorney, "than the issues involved in the Herminghaus case." Mr. Preston is counsel for the plaintiff in this *cause celebre* of irrigation litigation, and naturally feels and speaks strongly on the matter, as will be seen in subsequent quotations; but whether or not he is correct in his assertion that the case is unique for the misrepresentation of the involved isues, at least none has attracted more wide-spread attention among irrigationists or been recognized as of more importance for the questions of water law involved.

The underlying facts in the case, as set forth in a memorandum prepared by Hankins & Hankins, attorneys for the Glenn-Colusa Irrigation District, are these:

"The plaintiffs in the action of Herminghaus vs. Southern California Edison Company are the owners of some 18,000 acres of land in the overflow basin of the San Joaquin Valley in California and riparian to the San Joaquin River. The defendant power company has built a dam in one of the different branches of the river, and desires to store the winter flood flow of water in a reservoir, to be released gradually and to be used for the creation of electric energy. The riparian land owners claim that their lands are overflowed in winter, and that this seasonal overflow produces pasturage and enriches the land by the deposit of sediment. Storage of flood waters, they contend, will prevent this overflow and thereby will injure their lands.

"The trial court found for the plaintiffs, deciding broadly that a riparian owner of lands could prevent the storage of winter flood water either by appropriators or riparian owners if such storage in any way interfered with any use of the water by lower riparian users. The question of the reasonableness of the use was not considered. An appeal has been taken from the decision to the Supreme Court of California and is now pending."

THE DISTRICT'S attorneys believe that such a theory as that embodied in the trial court's decision is "simply appalling" and that its logical carrying out would incalculably handicap further irrigation and hydro-electric developments in the state, sending California "back to covered-wagon days." This is their analysis of the issues involved:

"The development of irrigation in California has been retarded by the early adoption of the strict riparian theory as enunciated by the Supreme Court in the case of Lux vs. Haggin. In this case riparian rights were declared vested rights, and any appropriators of water were trespassers, their final right depending on whether they could use the water for five years before being discovered and stopped. Again in the Miller vs. Madera Canal case no regard was had to the reasonableness of a use of water. Once more it was held that a riparian owner could make only a slight or theoretical use of the water while the rest of the country, parched with thirst, must watch the water go by to be wasted in the ocean.

"A faint gleam of light was seen in the late case of Williams Irrigation District vs. Antioch, where the theory of the plaintiff, to the effect that a user of water in the lower reaches of the river could demand sufficient water to hold back salt water, was repudiated.

"The logical following out of the theory of the trial court in the Herminghaus case is simply appalling when we consider that all storage projects, on which practically all hydro-electric development depends, are placed at the mercy of the owner of a ten-acre tract of land on a river, overflowed once a year by a torrential stream. Although old projects may be protected by the statute of limitations, no one would dare to start a new storage project."

THE WHOLE riparian doctrine as it involves the water situation in California is brought into the lime-light by the issues raised in this case, declares William Durbrow, president of the Irrigation Districts' Association of the state, which has become sufficiently interested in the Herminghaus suit to instruct its own attorneys to file briefs and to appear as *amici curiae*. Mr. Durbrow states the attitude of the irrigation districts as follows:

"In spite of the theory of riparian rights as enunciated in Lux vs. Haggin, it would still appear that some reasonable ground could be taken by our courts, which would hold the riparian owner to the use of the water flowing by his land in accordance with practices that have been worked out and found reasonable throughout the western states. This means its proper diversion and its economical use, without which the continued growth of our agricultural activities becomes impossible. We have now arrived at a point in the state of California where we can see to the end of our water resources. To use our water that we may get the most out of it is absolutely essential to the growth and well-being of the State.

"Rights initiated by appropriation now provide for suitable hearings where all parties at interest may be heard and a proper check be put upon the use of the water so appropriated. This becomes impossible on diversion under the riparian doctrine under which the land owner has been making his own definition of use and of his relationship to his fellow users on the same stream. It seems fundamental that his right acquired under this doctrine should be construed strictly in accordance with the needs of a semi-arid country where the improvident use or the unregulated storage of water becomes a serious menace to the prosperity and growth of the commonwealth."

ONE of California's most eminent authorities on water-litigation is Dan Hadsell, of San Francisco. In response to a request for his opinion on the Herminghaus issues Mr. Hadsell replied with a statement in which he emphasized the value of the riparian principle, suggesting that there is but one limitation which may be safely applied to it. His opinion is:

"The Herminghaus Case, as I understand it, involves two questions in riparian rights, namely—(1) the extent to which a riparian owner on the stream may store water for future use, and (2) the extent to which a riparian owner may insist that the flow of the stream shall continue without diminishment by an appropriator above him.

"As concerns the first question. I do not know the facts in the Herminghaus Case and therefore I can only state what I think should be the principles that the court should apply. These principles are (a) there shall be no storage to the prejudice of a lower riparian owner; (b) there shall be no cyclic storage as against any lower riparian owner even though such storage is not directly injurious to such owner; (c) any water released from storage shall continue to belong to lower riparian owners as though such water had never been abstracted from the stream.

"The second question suggests a possible limitation upon the riparian right. I am in favor of only one limitation, namely—that the riparian landowner shall be entitled to have only such water from the stream as shall be necessary for the beneficial and economic irrigation of the whole of his irrigable riparian land. But I do not think that he should be robbed of this right, if he does not use it, by any attempt to deprive him of it, without compensation, by a statute which imposes a loss of his right simply because he has not used it. And even the additional right which the riparian owner now has, against appropriators above him, to insist upon the flow of the stream 'undiminished in quantity and unpolluted in quality' should not be taken from him except through condemnation and after price paid. The owner of riparian land has bought it because of its position on the stream and because of the riparian rights which the laws attach to such land. Morally as well as legally, the owner should be paid for whatever is taken from him by limitation. In consequence, no limitation should be put upon the riparian right by legislation such as Section XI of the Water Commission Act or by judicial decision such as some parties to the Herminghaus Case are seeking. And this conclusion must more forcibly apply to any limitation on the riparian right which is more

stringent than the one here suggested. I have long advocated that the state should condemn such parts of the riparian rights on every stream as are in excess of that limitation."

GLENN D. SMITH, president of the Mutual Water Companies' Association, also sounds a note of warning that the riparian theory ought not to be discarded—even if that is possible—without making sure that whatever principle is proposed to replace it would not be less perfect than the one now in effect. Better to bear the ills we have, he says, in effect, than to fly to those we know not of. We have had plenty of water litigation, he declares, and should be wary about any change that would increase it. His statement follows:

"The old Common law of riparian rights was adopted by the State of California more than sixty years ago, and I believe that lawyers who have given the question of changing that law careful study are of the opinion that the California Legislature is without authority to change it, as the abolishing of riparian rights would in effect be confiscation of vested rights. I think that it is very generally admitted that the riparian law has not provided the best method for appropriation and use of water for this state, but it is the law under which many valuable water rights were taken out, and by this I mean water rights the value of which is measured by the use to which the water has been put. This fact has been established and a change in that law should be approached with great caution. Assuming that a way may be found to change the present law, then that proposed method of appropriation and use of water should be referred to the different water interests of the state for consideration and suggestion, and certainly any new law would have to safeguard fully the present users of water.

"In any case, let us not do anything that will increase water litigation, for we have had quite enough of that. The Herminghaus case is merely incidental to the whole question, and if the Supreme Court sustains the injunction it will undoubtedly prevent the fullest use of some of the waters of California, which is regrettable, but until we give the Supreme Court some law other than that of riparian rights to guide it we should not complain of its decisions.

"I am not defending the law of riparian rights but until we find a sure and safe way out of it I suppose we will have to suffer from it.

"Possibly the litigating of the Herminghaus case may point the way to new equitable and safe methods of determining water rights. Changing the laws affecting water rights in this state is rather a momentous undertaking and must be viewed from many angles. The fullest development of the state as related to the fullest use of the waters, I believe, demands a change, but the welfare of the state demands that this be done with great care."

IN THE brief filed in the case by the Southern California Edison Company, the defendant stands upon its rights as a riparian owner, rather than following the tactics of the Irrigation Districts' Association in asking for a modified construction of the riparian doctrine. The contention is made that the company is merely exercising its proper rights as a riparian owner in storing water. Quotations *in extenso* from the brief are of course imposible, but the following headings from its topical index will give an idea of the issues upon which the defendant is basing its case and its appeal to the Supreme Court:

1. Edison Company has all the rights of a riparian owner. These rights are of two classes—one, the ownership in fee to certain lands riparian to Big Creek and Stevinson Creek; two, certain leasehold interests under licenses and permits from the United States, authorizing the occupancy of lands of the United States riparian to the river for power development.

2. The production of hydro-electric power is a proper subject of riparian use.

3. The reservoiring of water for future use by a riparian owner is a proper exercise of a riparian right and like every other use of water by a riparian owner is governed only by the reasonableness of such use in view of all of the surrounding circumstances and the rights of all parties.

BECAUSE of the general interest aroused by the pending Herminghaus Case, MODERN IRRIGATION has felt that a symposium of opinion from men conversant with the legal aspects of water development, on the issues of the suit, would be of value to its readers.

Opportunity for the expression of their views was afforded to both of the litigants, to the Irrigation Districts Association, as a party in interest, and to several of the leading land and power companies of the state. The accompanying article presents the varying views of spokesmen for both sides, and from parties who are interested in the development of a wise water law but have no direct concern in this particular litigation.—EDITOR.

4. The reservoiring of water is not inherently illegal or unreasonable.

5. The lower riparian owner must reasonably exercise his rights and must adopt suitable means to enjoy the same, and the mere fact that the use by the upper riparian owner causes some expense to the lower owner does not make such use (by the upper owner) illegal or unreasonable.

6. A riparian owner is not entitled as against another riparian owner to have the stream maintained so it will overflow his land.

7. The contention that plaintiffs are entitled to maintain the full flow of the stream to enable it to flow into the high water sloughs is unfounded.

(1) The inconvenience results from any use above and is due to an inherent infirmity in plaintiffs' situation, and the resulting damage is *damnum absque injuria.*

(2) Plaintiffs can avoid this result by constructing power works for the diversion of the water into the sloughs or otherwise onto their land.

8. Even if the riparian owner ever had the right asserted by the plaintiffs to the full flow of the stream as against another riparian owner desiring to reservoir and make beneficial use of the water, such right has lawfully and properly been taken away by legislation through a valid exercise of the power of the State to regulate the use of water between the joint owners thereof.

JOHN W. PRESTON, counsel for the plaintiff in the case, has submitted a statement in which he declares that "no set of issues was ever more grossly misrepresented" than those in the case under discussion, and he goes on to specify what those issues are. The following is quoted from his letter:

"We are not contending solely for the value to us of the overflow right in the San Joaquin River. We are contending that sixteen thousand acres of land will be entirely depleted of their water right if the power company is permitted to store in the manner proposed by them. In other words, we have numerous branch channels of the San Joaquin River traversing our lands. Some channels carry water when there are 2500 second feet in the river; some when there are 3500; some when there are 4000; some when there are 5000; some when there are 6000 and some when there are 8000 second feet in the river. All branch channels above 3000 second feet will be entirely depleted of their flow of water.

"All lands bordering upon these branch channels will, therefore, be dry and without the right to go to the low water channel for their water because the segregation line of the swamp and overflow title lands will cut these lands off of the low water channel and leave them entirely dependent upon dry branch channels for their riparian right. The acts and conduct of the power company will destroy absolutely the water right to sixteen thousand acres of valuable land.

"In addition to the above, it should be noted that the defendant has entered into contracts with Miller & Lux, Inc., in which contracts the power company admits it has no right to store water to any extent whatsoever except as the agent or licensee of Miller & Lux. This places the power company without the protection of the riparian right law.

"In addition to the above it should be noted that the defendant power company intends to store about seven hundred thousand acre feet of water, which is about seven-tenths of the entire flow of the stream between April fifteenth and July fifteenth of a normal year. The right thus to deplete the stream cannot be anything more than the claim of an appropriator and, of course, could not be held reasonable as to the riparian proprietors below who have an equal right to all the said waters.

"Furthermore, the power company has the San Joaquin River system tied up to its other systems upon various streams and also to its steam plants. It intends to store this water and discharge it according to the load demand upon its entire system, or when through emergency or failure of other systems it may become necessary to use the storage of the San Joaquin.

"In other words, the rights of the riparian owners below are entirely disregarded in the plan of the power company.

"Whether as a matter of policy it was unwise to adopt the riparian right law as we did by statute in this state seems to be a question foreclosed by the intervention of the rights of private property."

THE IRRIGATION DIGEST

A Monthly Bulletin Board of Brief Facts and Events from Far and Near

Five Million Dollar Project

The American River Hydro-Electric Company has filed articles of incorporation in California and has announced its proposal to spend $5,000,000 on a dam project at Folsom, California.

Agricultural Engineers Meet

The winter meeting of the Pacific Coast section of the American Society of Agricultural Engineers will be held December 18, at Davis, California. The main subject for discussion will be "The Place of the A. S. A. E. in Reclamation."

To Build Experimental Dam

Prominent engineers from many parts of the country gathered in Fresno, California, early in December, to perfect plans for the construction and breaking of an experimental dam on Stevenson Creek, tributary to the San Joaquin River. The dam will be destroyed in the experiments. It will cost $100,000.

Banta-Carbona Work Done

Twenty thousand acres near Tracy, California, have been opened to irrigation by the completion of the construction work on the Banta-Carbona irrigation project. The project has involved the expenditure of about a million dollars, during the past year, for a dredged channel, large pumping plant, canal and pipe lines.

Melones Construction Starts

Foundations for the Melones Dam, which will supply water to the Oakdale and South San Joaquin irrigation districts (California) have been completed and everything is in readiness for the pouring of the first concrete. Grading for the railroad has been finished, and rails were expected to be laid by the first of December.

Hoquiam Has Lots of Water

Hoquiam, Washington, has a bountiful supply of water assured as a result of the recent completion of a seven-mile pipe line from Davis Creek, supplying seven and one-half million gallons of water daily. The city has purchased 4000 acres of watershed lands on either side of the creek for the purpose of protecting the water supply.

Tumalo Fights Bend Diversion

The Tumalo (Deschutes) Irrigation District (Oregon) has served notice on the city of Bend that it will vigorously oppose any attempt on the part of the municipality to divert water from Tumalo Creek for domestic and muncipal use.

Seeks New Columbia Survey

C. C. Dill, U. S. Senator from Washington, has announced his intention of seeking authority from Congress for a survey and investigation of the Columbia River Irrigation project to be made by the senate committee on reclamation and irrigation next summer.

To Reclaim Million Acres

One million acres of land in the Yaqui Valley, on the west coast of Mexico, will be eventually reclaimed by plans now under way under the direction of the Richardson Construction Company, according to a statement from E. E. Richardson, president. Five million dollars have already been spent on this project, and 90,000 acres are now under cultivation.

Voters Endorse Relief Measure

Almost a unanimous vote was recorded by voters of the Boise-Kuna, Idaho, division of the Boise project at an election in November on the question of organizing into a district to obtain relief under the fact finders' bill. Of 772 votes cast, 745 voted in favor of the measure. J. A. Martin was elected a director from Precinct 1; Charles Thacker from Precinct 2, and George Oleson from Precinct 3.

Begin Concreting Canals

The work of lining with concrete 800,000 square yards of irrigation canals on the Salt River project has been commenced by the Salt River Valley Water Users' Association. The task will require about $750,000 for its completion, and will save 70,000 acre-feet of water in an ordinary year, according to reports from the Arizona project. The water saved by this means is to be used on the Roosevelt Conservation District.

Builds Private Dam

W. H. Detert, prominent land-owner of Middletown, California, is completing the construction of a dam at Gwenoc site in the Putah Creek watershed. The dam is thirty feet high and about 1000 feet long, and will impound water for the irrigation of 2,000 acres of Napa County land for alfalfa growing.

Form New Mexico District

By an overwhelming vote land owners of the Santa Cruz Valley, New Mexico, decided in November to form an irrigation district, which will embrace about 9,000 acres. The plan of the embryonic district is to build a reservoir in the Santa Cruz valley, above the town of Santa Cruz, at a cost of about $150,000, and to distribute the impounded waters through community ditch systems already constructed.

Form Montague District

Voting bonds to the amount of $1,395,000 for the installation of an irrigation system to water 19,500 acres of land surrounding Montague, Oregon, residents of that section in November recorded their intention to form a new irrigation district, of approximately the same acreage as the Grants Pass, Oregon, district. A dam will be built on the Shasta River, twenty miles from Montague, and a main canal 21 miles long, with 60 miles of lateral, will be constructed.

Propose New Plan for State

A bill proposing a change in the method of administration of irrigation districts will be introduced before the Washington state legislature, now in session, according to E. F. Banker, chairman of the irrigation committee of the lower house. The bill to be presented will propose the elimination of the office of state director of reclamation and in its place would establish a board consisting of the state land commissioner, state treasurer and state commissioner of agriculture. Reclamation would be under the control of this board, which would also be charged with the administration of the state reclamation funds.

Equipment Association Drafts New Pump Contract Form

November Meeting of W. I. E. A. Devoted Mainly to Consideration of Problems of Standard Guarantee

A standard form of pumping plant performance guarantee designed to prove acceptable to both manufacturer and consumer, looms as the most outstanding achievement of the November 20th meeting of the Western Irrigation Equipment Association, held in San Jose, California.

The executive committee of the association spent practically the entire morning in discussing the proposed standard guarantee with the California Committee on the Relation of Electricity to Agriculture. Several minor changes were made in the form of the document, and it was then pronounced ready for presentation to the membership of the association in the open afternoon session.

Here many more comments and suggestions were offered, and at last a draft that is considered practically certain to prove acceptable to all interests was evolved. As is the custom of this organization, however, the final adoption by vote of the membership was withheld until the Los Angeles meeting, slated for January 22nd, 1926. It is taken for granted that by that time representative manufacturers, dealers and irrigators will have had ample opportunity to weigh the proposed form, and decide their attitude toward it.

The November meeting, which recorded the largest attendance of any session of this body to date, was declared a success from every standpoint. At the banquet held in the Vendome Hotel, Friday evening, Joe Cox presided as toastmaster, and a number of interesting discourses were presented. Of especial value was an informative address on the new cotton industry of California. The speaker, J. Bradley Clayton, laid special stress on its tie-up with the irrigation equipment industry.

On the day preceding the regular association meeting, the pump manufacturers held an informal gathering at which the advisability of forming an organization of manufacturers of this type of equipment was considered. A temporary chairman, Robert Sherman, with C. A. Utley as temporary secretary, was appointed, with a view to giving the plan further consideration and reporting at a meeting to be held in the near future.

The exact form the organization will take, if it is formed, has not yet been decided. It may be conducted as a branch of the Western Irrigation Equipment Association.

You *Name the* Load
We *Make the* Pipe!

SINCE concrete pipe (as made by Bent) came into its own, engineers question no longer its striking advantages for a great variety of uses. *But*—a concrete pipe installation is either a mediocre or an eminently superior job of work, depending upon who fulfilled the contract.

Many trade names have become hall-marks of tradition, that serve as an unerring guide to discriminating buyers. Today the name "BENT" on a joint of Concrete Pipe marks it as a strictly finely made product. The same care and skill is exercised in its manufacture, and in the laying of the line, as though every future contract depended on *that* job meeting the fullest requirements of specifications—*and more.*

Let us give you a "concrete" demonstration of what we mean by "Bent" Service.

IRRIGATION MANAGEMENT

ALKALI DANGEROUS ON HIGH-WATER TABLE

ONE of the most important problems of the citrus and walnut grower is that of the effect of alkali on citrus and walnut trees, says Vincent Blanchard, farm advisor of Ventura County, California, in a recently issued Farm Bureau publication.

There are at least three different conditions in which alkali salts are found, says Mr. Blanchard. First, where alkali is present in the soil due to a rise in the water table. Second, where irrigation water is used that has a high salt concentration, and third, where the concentration of salts in the soil increases due to the failure of rainfall in being sufficient to distribute the salts by leaching.

The grower of citrus and walnut trees on soil which has a high water table has a real problem to face. Citrus and walnut trees are exceedingly sensitive to the effects of alkali salts.

ACCORDING to Dr. W. P. Kelley of the Citrus Experiment Station, who has had charge of the alkali investigations for the College of Agriculture of the University of California, walnut trees are so sensitive to the efects of alkali salts that if lower roots reach the high point of concentration near the water table the trees show the effects in the tops even though the salt concentration might be very low in the upper few feet. It is therefore, hazardous to plant walnut trees on high water table land.

Citrus trees, being more shallow rooted, might do better on such land than walnuts providing there is adequate drainage, so that the water table will not rise. It is particularly dangerous to plant trees on such land unless this drainage is provided as the time will come when we will have heavy rainfall with its effect on increasing the height of the water table.

Those orchards which are being irrigated with irrigation water with a high salt content can be corrected only with the securing of a better supply of water.

RECENTLY Dr. Kelly called all of the Farm Advisors of Southern California to a conference at Riverside on the effects of alkali on citrus and walnut trees. He showed the Farm Advisors citrus orchards in the Riverside district which had both salty water and pure water. He pointed out orchards which were at one time considered the very finest in the state and which today are in an exceedingly poor condition. The tops are smaller, the foliage chloratic and mottled and the fruit production is very low. Other orchards with good irrigating water alongside of these are in a healthy condition and produce profitable crops. It was pointed out by Dr. Kelly that the poor results have not come all at once but extended over a period of several years. As the citrus plantings in the Riverside district increased, the gravity water from the mountains became insufficient to meet their needs; therefore, wells were drilled to supplement the gravity water. Those orchards irrigated from several of the wells show the effects of salt injury.

Two walnut orchards were observed with the salty water and the other with a pure water from the mountains. The walnut trees with the salty water were practically dead while the others were in a healthy condition.

ONE orchard was observed which, at one time, showed good foliage and a healthy growth. With the development of irrigation water from a well on that property 50 per cent of the trees actually were dead and most of the remaining trees were almost dead. Another orchard was shown the Farm Advisors to which Dr. Kelly was called several years ago to try to determine the cause of its decline. Dr. Kelly found that the irrigation water showed a very high salt content. He therefore advised the grower to develop a better supply of water, which advice the grower carried out. With the use of better water this particular orchard has recovered and is growing profitable crops.

The third condition under which alkali salts are injurious to citrus and walnut trees is where the salts have become concentrated as a result of several years of drought. This has been particularly noticeable in some sections during the past two years and to a great extent this year. On walnut trees the effect is apparent with the browning of the edges of the leaves and premature dropping. It would be advisable in such cases for the growers to try to distribute the salts through the soil by basin irrigation with the application of a considerable amount of water. Perhaps one irrigation with such a method, even though large quantities of water are applied, does not accomplish this distribution of salts as the salts tend to rise and accumulate near the surface.

President's Message Deals with Problems of Reclamation

Colorado River Development, State Aid in Settlement of Projects, Urged by Coolidge Before Congress

The President's annual message to Congress, read before the joint session of the two houses December 8th, touched upon reclamation and the development of the Colorado River as two of the major problems before the nation.

Reviewing briefly the condition of federal reclamation, President Coolidge suggested that co-operation should be required from the state in the "intimate, detailed and difficult work of securing settlers and developing farms." On the subject of reclamation, he said, in part:

"The national government is committed to a policy of reclamation and irrigation which it desires to establish on a sound basis and continue in the interest of the localities concerned. Exhaustive studies have recently been made of Federal reclamation, which have resulted in improving the projects and adjusting many difficulties. About one-third of the projects is in good financial condition, another third can probably be made profitable, while the other third is under unfavorable conditions.

VISION

FROM a vantage point gained on the Heights of Long Experience, we survey the Pumping Problems of the Irrigation empire. PACIFIC PUMPS is our answer. Not ONE pump superior for a few conditions, but a LINE of pumps meeting every condition confronting the rancher, the citrus grower or the municipality. Evidence indisputable of the happy manner in which PACIFIC PUMPS are giving service over a widespread territory, is yours on request.

Deep Well Turbines and Horizontal Centrifugal Pumps.

"The Congress already has provided for a survey which will soon be embodied in a report, that ought to suggest a method of relief which will make unnecessary further appeals to the Congress. Unless this can be done, Federal reclamation will be considerably retarded. With the greatly increased cost of construction and operation, it has become necessary to plan in advance, by community organization and selective agriculture, methods sufficient to repay these increasing outlays."

A recommendation for a policy of state co-operation in solving the problems of settlement, which has been urged by the present heads of the Reclamation Bureau, is contained in the President's message:

"The human and economic interests of the farmer citizens suggest that the States should be required to exert some effort and assume some responsibility, especially in the intimate, detailed and difficult work of securing settlers and developing farms which directly profit them, but only indirectly and remotely can reimburse the nation.

"It is believed that the Federal government should continue to be the agency for planning and constructing the great undertakings needed to regulate and bring into use the rivers of the West, many of which are interstate in character, but the detailed work of creating agricultural communities and a rural civilization on the land made ready for reclamation ought to be either transferred to the State in its entirety or made a co-operative effort of the State and Federal government."

TURNING to the question of the Colorado River, the message said, in part:

"Preliminary measures are being taken on the Colorado River project, which is exceedingly important for flood control, irrigation, power development and water supply to the area concerned. It would seem to be very doubtful, however, whether it is practical to secure affirmative action of the Congress, except under a joint agreement of the several States.

"The government has already expended large sums upon scientific research and engineering investigation in promotion of this Colorado River project. The actual progress has been retarded for many years by differences among the seven States in the basin over their relative water rights and among different groups as to methods."

The history of the Colorado River Compact was then briefly traced, and the message continued:

"It is imperative that flood control be undertaken for California and Arizona, preparation made for irrigation, for power and for domestic water.

"Some or all of these questions are combined in every proposed development. The Federal government is interested in some of these phases, State governments and municipalities and irrigation districts in others, and private corporations in still others. Because of all this difference of view it is most desirable that Congress should consider the creation of some agency that will be able to determine methods of improvement solely upon economic and engineering facts, that would be authorized to negotiate and settle, subject to the approval of Congress, the participation, rights and obligations of each group in any particular works. Only by some such method can early construction be secured."

Importance of Water Titles Explained by Mr. Bryan

(*Continued from Page 14*)

uncertain status of old appropriative rights initiated prior to the effective date of the Water Commission Act, order should long since have evolved out of chaos in the matter of water titles.

WHILE the present situation is much improved, over that of years past, it is not yet one of such certainty as is desirable. Many old appropriative rights are not even recorded and are based purely upon beneficial use. Many of the old appropriative claims which were posted and subsequently filed in the offices of the County Recorders have never been consummated, or, if consummated wholly or in part, have since been partially or wholly abandoned. We have the developments already made under an unrecorded claim of riparian right, and we have also the claim of riparian right for proposed future developments, which claim is now denied by the provisions of Section 11 of the Water Commission Act as noted above. And we have the developments which have proceeded by appropriation under the provisions of the Water Commission Act, in which cases the priority is clearly defined as is also the amount, place, and manner of use and the source and point of diversion. This last class of water rights is the only one which is accurately recorded, and where title is promptly and effectively forfeited in accordance with the statute when the right is forfeited by non-use.

The Water Commission Act provides that upon its own motion or the request of one or more users of water from a stream, the Division of Water Rights may undertake an adjudication of the *appropriative* rights to divert therefrom. The Act further provides that where suit has been brought involving the use of water from a stream the Division of Water Rights may, through reference by the court, undertake a determination of all the rights, *riparian as well as appropriative,* upon the stream.

Where work of this character is undertaken, the Division establishes the relation of the various claims of right by means of field surveys and investigations, examination of records, and the proofs which are required from the several claimants. Its findings, when confirmed, or as modified by the court, clearly fix the extent and relations of the various rights involved.

The Water Commission Act provides also that in those cases where the various water rights upon a stream have been determined the Division of Water Rights may—upon request of the water users—appoint a water master to administer said stream and to see that the waters thereof are distributed to the various claimants in accordance with their established rights. Prior to any formal determination of rights the Division has been enabled also, by agreement among the various claimants of right, to appoint a watermaster to distribute the waters of Kings River, Shasta River, Burney, Owl and Soldier Creeks.

THE KINGS RIVER case is a most interesting one. Here was a stream of some 1,900,000 acre feet mean annual discharge supporting an irrigated agricultural development of 650,000 acres. After years of litigation, resulting in many conflicting court decrees, the various claimants in 1917 requested the co-operation of the State Water Commission, predecessor of the Division of Water Rights. An engineer of that office for four years obtained daily records of stream flow and diversions. With this data as a basis, the Division in 1921 prepared a schedule of distribution of water. By agreement among the water users this schedule has since been enforced without friction, and a way is being prepared for the construction and operation of storage works.

Confusion in the matter of water rights, threatened litigation, and an impending water shortage on Sacramento River created a similar desire for co-operation on that stream early in 1924. A "water supervisor" was appointed by the Division of Water Rights to effect such economies as were possible in the use of water and to assemble accurate data concerning stream flow and diversions in Sacramento Valley and the Sacramento-San Joaquin River Delta. This work was financed principally by local subscription in 1924, but the legislature has provided funds for a continuation of the work in 1925 and 1926.

The Division is carrying on a somewhat similar investigation on San Gabriel River in Los Angeles County. This is being supported almost entirely by local subscriptions.

SUCH WORK has an importance that cannot be over-emphasized. California has passed through those early stages of development of its water resources when those who would could help themselves to the waters of her streams. There is no longer an abundance of water from which all may help themselves. There are few streams in the state on which the total low flow is not already appropriated—perhaps over-appropriated. The construction of vast storage works now makes an accurate determination of even the flood flow rights of vital importance.

We may, without forethought and foresight, let matters take the course which they did on Kings River prior to 1917 and which they were taking on Sacramento River prior to 1924. Tediously, haltingly, and at terrific expense, the relation of the rights of the various claimants may be worked out by litigation. Calmly and expeditiously and with nominal expense the same problem may be worked out through physical investigation by impartial experts. It is interesting to note, in passing, that the annual cost of the investigation on Kings River has averaged about 1½ cents per acre affected while the Sacramento-San Joaquin Water Supervisor work is averaging approximately 4½ cents per acre per year.

The ultimate objective of all water legislation and administrative effort is the distribution of the water itself to those who have a valid claim upon it. This object cannot be accomplished while water titles are in doubt. We now have a positive method of initiating new rights but further development of California's water resources must be uncertain and slow so long as there is uncertainty concerning existing rights. The conflicting theories of appropriation and riparian right make it difficult to clear up this uncertainty. Three courses are open to accomplish this end. One is by litigation. A second is through the code provisions of Sections 24 to 36f, inclusive, of the Water Commission Act. The third is through such investigations described above as are now in progress on Kings River, Sacramento and San Joaquin Rivers, and San Gabriel River. The readiness with which development proceeds will depend largely upon the success with which litigation is avoided and rights determined by physical investigation and the collection of run-off and diversion records.

HYDRAULIC ENGINEERING

Dealing with the Practical Problems of the Operating and the Consulting Engineer

DRAINAGE PROBLEMS OF THE LOWER RIO GRANDE

By CHARLES P. WILLIAMS
Consulting Engineer

THE LOWER RIO GRANDE Valley, for a distance of about one hundred miles from the Gulf of Mexico, has the geological formation of a river delta. Repeatedly, the river has changed its course, departing from its channel along the crest of the ridge formed by alluvial deposit during overflow, and building a new channel in some lower part of the delta region. An old channel having its ends soon filled by deposits of sand and silt from the river became a lake, in some cases of considerable length, in others relatively short and of horse-shoe shape. Such a channel, when of considerable length, is known, in this section, as a resaca, and one resulting from the river cutting thru the neck of a horse-shoe shaped bend, as an estero.

At the time of overflow, the river water is heavily laden with sand, silt, and finely triturated clay. These are held in suspension by the turbulent and swiftly moving water in the river. When overflow occurs the velocity of the outflowing water is reduced by the decreased depth of the sheet of water and by the retarding effect of the brush and other vegetation, through and over which the flowing water must pass. The reduction in velocity results in the deposit of the sand, silt and clay, carried in suspension. The coarser and more pervious materials are deposited nearest the river. The less coarse materials are carried farther and are deposited in the reverse order of their finess.

NOT only the coarser, but also the larger part of the materials carried in suspension by the river water is deposited near the river. The lands near the river thus become higher than the more distant lands. It results, therefore, that the higher lands along the resacas, or the ridges which mark the location of obliterated resacas, have more sandy and relatively pervious soils, while the lower intermediate basins between the resacas have have dense and impervious clay soils.

Owing to the irregular topography of the land over which overflow occurs, and the irrigular character and distribution of the vegetation which retards the flow, the depth and character of the deposited materials are very irregular. The strips of land along the resacas and ridges, having sandy loam or silty clay loam soils, vary in width from a few hundred feet to half a mile or more. Sand and other soil strata are found in some places continuous for a considerable area and in other places in isolated pockets or lenses.

THE LANDS of the Delta have topography shaped principally by flood deposits and but little by erosion. The natural surface drainage is therefore toward comparatively small closed depressions. The resacas of more recent geologic formation, while having, for short distances, channels of considerable capacity, are disconnected, and moreover are situated along the higher areas. For only very narrow strips of adjacent land is there natural surface drainage toward a resaca. With only one exception, the Arroyo Colorado, is there free natural drainage outlet to the Gulf. There is therefore practically no natural surface drainage for the large area of delta lands. Any surplus rainfall and water applied in irrigation, above that required for plant growth, must either be evaporated or must sink into the subsoil, contributing to the rise of ground water.

Delta lands in general have a slope toward the Gulf of only about two feet to the mile. The velocity of the underflow must be therefore extremely low and the underflow must offer but little assistance in the disposal of excess subsoil water.

In the Delta lands the amount of alkali salts within the root zone is ordinarily not excessive, unless concentrated in the upper soil by excessive evaporation due to high water-table. The lower soils of the Delta, to some extent at least, were deposited in seawater and therefore impregnated with sea-salt. In the Brownsville area sodium chloride (common salt) and calcium chloride, both very destructive to vegetation, predominate. Sodium carbonate, commonly known as black alkali, does not occur in appreciable quantities.

Although the average rain-fall of the Delta region is no more than that required for plant growth during the long growing season, its distribution is very erratic. The annual rainfall in the irrigated region has ranged from 12 to 60 inches. Frequently, however, the greater part of the annual rainfall occurs in a single month, or even in a single storm. A precipitation of 5 inches in 24 hours is not uncommon, and two inches in 24 hours is of frequent occurrence. Due to the lack of surface drainage, the greater part of the water falling during these torrential storms must either evaporate or sink into the subsoil, thus contributing greatly to subsoil water.

NECESSARILY the principal canals of the irrigation system in the Delta must be located along higher lands in the irrigated area. These lands, particularly along the immediate crest of the ridges, have the most permeable soils of any of the Delta lands. The seepage from the canals is therefore greater than if the canals could be constructed in the more impermeable soils. During the earlier construction period, resacas, where available, were used as main canals. In their use as reservoirs, and in order to provide irrigation for lands immediately adjacent, the resacas were kept bank-full. While the river silt deposited in the resaca bottoms undoubtedly reduced greatly seepage losses therefrom, the upper portions of the banks remained very porous and the water lost through seepage contributed

This discussion of factors which affect the water situation in the Lower Rio Grande Valley and make drainage a difficult problem is reprinted from a much longer and more exhaustive treatment of the subject by the author in the Gravity Irrigation News, published in McAllen, Texas, by the Lower Rio Grande Valley Water Users' Association.

ACCURATE WATER MEASUREMENT PAYS

"A Winning Hand"

A set of these cards will be furnished on request

Keep Permanent Records of the Water You Use!

Modern business management demands that accurate records be kept of every transaction and today water is being more closely watched and accounted for than ever before. The satisfaction of knowing exactly what you are doing at all times is the outstanding reason for the use of

THE SPARLING METER

Built upon scientific principles and tested by eight years' use it has proven indispensable in hundreds of Irrigation Systems, in Municipal Water Departments and in many different types of industries.

Send for the 16-Page Catalog which contains interesting Charts and Data on Water Measurements

R. W. SPARLING

For Detailed Listings, Branch Offices, Etc., See the Buyers' Guide to Leading Supply Sources—Pages 55-56

greatly to the sub-soil water and to the concentration of injurious salts in the surface soil. In some of the irrigation projects, unusually large main canals were constructed, in order that they might serve as equalizing reservoirs. Although the permeability of these large canals undoubtedly has been greatly reduced by silt deposit, due to extremely slow velocities of the water flowing through them, the seepage losses probably exceed the losses of canals usually built for serving similar areas.

BUT LITTLE data are available for determining the amounts of water per acre delivered at the land, in irrigation in the Delta. There is no doubt that the quantity used in many cases is excessive. The writer has been informed by ditch riders that, to their positive knowledge, amounts ranging between one foot and one and one-half feet in depth have been used in a single irrigation. The methods used by the farmer in applying water are, in many cases, not such as result in the greatest economy. The prevalent custom of charging for water a certain amount per acre per irrigation is conducive to waste. Surplus water used sinks into the ground, causes a rise in the ground water, and results in increased cost to the farming community by hastening the need for drainage and by increasing the extent of works needed.

On some projects many canals are kept full of water when little or no water is being delivered therefrom. Canal losses are nearly proportional to the time water is kept in canals. In many cases water is kept at a higher elevation in canals than necessary for making deliveries. Canal losses are increased by increased depth of water.

THE REQUIREMENTS for subsoil drainage becomes more pronounced as the lower end of the Delta is approached. In the westerly end of the Delta, the water is generally not dangerously near the ground surface, except immediately adjacent to canals. Borings made in the Pharr-San Juan District indicate a water-table generally ten feet or more below the ground surface, except for areas about 100 feet in width along canals. In some places the ground-water was found to be from 20 to 30 feet below the ground surface. Along the canals, however, in the greater part of the area investigated, the ground-water was very near the ground surface and canal borrow-pits in most places were full of water. In the El Jardin District, at the lower end of the Delta, ground-water is usually found at depths of five feet or less below the surface, and there are only a few comparatively small areas where it is not dangerously near the surface. In that district it appears that excessive evaporation takes place from the silty soils along the resacas, when the depth of the water-table is about six feet. It is understood that the ground-water is dangerously high in many parts of the San Benito and Harlingen Districts. It is known to be high in certain parts of the La Feria district, in some cases within three feet of the ground surface.

Even in the westerly part of the Delta region, where the general level of the ground-water now is at a safe distance below the surface, its continued rise may be expected, and eventually sub-soil drainage will be necessary if the productivity of the soil is to be maintained. The construction now of intercepting drains along the canals probably will offer sufficient protection for most of the lands in the upper delta region for some time to come. Large areas in the lower delta region now require complete sub-soil drainage, if their productivity is to be maintained.

Big Exchequer Dam of Merced District Now Three-Fourths Completed

Remarkable progress has been made by the Merced Irrigation District in its big task of building the Exchequer dam and power-house and in re-locating 17 miles of the Yosemite Valley Railroad that at present runs through the reservoir site. The dam is already 78 per cent completed, and Bent Bros., the contractors, expect to finish both the dam and the power-house next February. Ten miles of the substitute railroad has been laid. Only five per cent of the excavation work on the roadbed and cuts of the entire line remains to be done. Bridge and tunnel work for the railroad is well advanced.

This announcement has been made by the managers of the syndicate of twelve California bond houses that underwrote the $9,010,000 six per cent bonds issued by the district last year to finance completion of its irrigation-hydro-electric project in the San Joaquin Valley.

The Exchequer dam has been pushed far ahead of schedule, the financial houses report. There is in place a total of 310,000 yards of concrete, and it will require only about 60,000 yards more to complete the dam and the spillways. Openings which have been left in the dam for passage of the winter floods will be closed, it is anticipated, about March 15 next. At that time the relocated railroad will be placed in operation.

Construction of the power-house is also well ahead of schedule. The valves, penstocks and waterwheels have already been installed. Nearly all the electrical equipment is on the ground, and delivery of the rest within a short time is expected.

R. V. Meikle and Ross White, the engineers in charge, anticipate putting the power-house into actual operation before May 1, 1926. This date is appreciably earlier than had been originally thought practicable. In addition, the power-house will have greater efficiency than was contemplated last year, by reason of the installation of improved models of machinery. The power output has been sold in advance, under long-term contract, to the San Joaquin Light & Power Corporation, at 4 1-2 mills per kilowatt hour.

The substitute railroad—itself a work of considerable magnitude for an irrigation district, costing approximately $4,000,000—entails among other matters the building of a number of bridges and tunnels. The ten miles completed consists of a 7-mile length beyond Merced Falls (including No. 1 steel bridge, two trestles and No. 1 concrete-lined tunnel), and a 3-mile length from No. 4 steel bridge to Detwiler.

Grading work will probably be finished by December 1, 1925. The railroad contractor will then have only the concrete lining of No. 3 tunnel and the excavation and lining of No. 4 tunnel to complete his contract. Wet weather will not interfere with this tunnel work, as the material for the concrete lining will be brought in over the new railroad.

By December 1, the American Bridge Company will start on the big bridge across the Merced River, estimated to take 90 days to build.

Irrigation 'Round the World

(*Continued from Page 12*)

great war taught all peoples the wisdom of producing certain of the necessities of existence as near home as possible. England, for example, is endeavoring to become independent in the cotton market; Spain is developing water power and is improving old irrigation facilities to save coal and be independent of shipping; France is likewise interesting herself in water power; Italy and even the smaller nations are planning both irrigation and water power. In regions where irrigation is profitable, water power developments are nearly

always associated nowadays with irrigation developments.

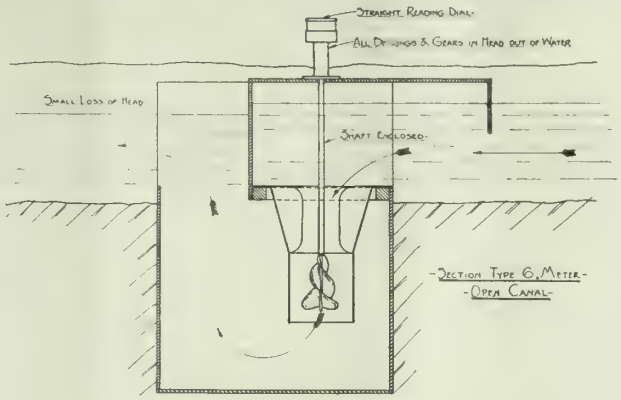
In the Western Hemisphere, however, irrigation activities have been intentions rather than achievements in the years since the war. In the United States the realization has at last been forced upon the country that the plan under which the governmental activities were carried out would not work. This has caused the nation to stop and take stock. Very little new work has been undertaken. While the troubles have been largely associated with the projects of the Reclamation Service, the general effect has been the same with all classes of irrigation institutions. An account of what has happened in this country can not be given here, for it is a story, and an interersting one, in itself. Outside of California there has been very little new irrigation work since the armistice.

MEXICO, that country with such wonderful possibilities in irrigation, is a country where there has been a great deal planned—but little done in a constructive way. Mexico is going through a complete reorganization politically and until there is evidence of stability and a willingness to encourage the investment of foreign capital, there is little hope for many of the large projects planned. Mexico has some of the richest opportunities of any nation. Its west coast has been described as the equivalent of California in the 60's. It is a region with a superb climate, capable of producing all sorts of crops,—winter tomatoes, sugar cane, cotton, lemons, oranges, or wheat if you like,—lying closer to the center of American population than California. If the Mexicans encourage foreign capital, we may expect to see these coastal planes filled with irrigation canals.

In South America there is much talk of the development of irrigation works. All down the west coast new plans are being talked of, but for lack of confident capital there is very little large work being undertaken. In Argentine new works are under construction and land is selling at present as high as a thousand dollars an acre.

Canada has gone through very much the same irrigation history as parts of the United States,—the inability of the owners of irrigation enterprises to make the ventures pay in the face of changed conditions since the war. In this respect irrigation does not differ from the building of railroads or many other large industries. Reorganizations are being effected and we may expect to see the business go on and finally reach the goal of financial success.

THE **RELIANCE** METER



Straight Reading Dial
All Drivings & Gears in Head out of Water
Small Loss of Head
Shaft Enclosed
Section Type G. Meter
Open Canal

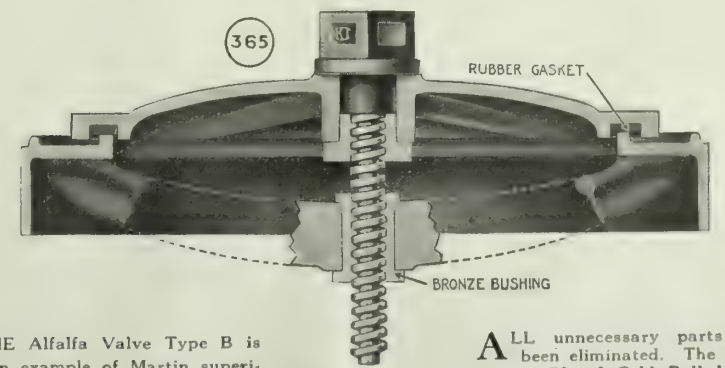
THE RELIANCE IRRIGATION METER has been the standard low pressure Meter for 10 years—thousands installed throughout the irrigated sections of the West. Built in various types and sizes to fit all deliveries on canal and pipe systems. Easy to install—easy to read. Straight reading cubic foot or acre foot dials. Simple in construction, few and slow moving parts—upkeep negligible. No bearings or gears under water—small loss of head. Unaffected by dirt and floating debris in water. There is a size and type to settle your measurement problem.

For full information and prices write—

RANDALL CONTROL & HYDROMETRIC CORP.
1014 E. Ninth St., Los Angeles, Calif.

Martin *Alfalfa Valve*
Type B

THE Martin line of Irrigation Appliances is the proud achievement of an organization of engineers and irrigation specialists who have worked out ranchers' irrigation problems from every angle.



THE Alfalfa Valve Type B is an example of Martin superiority. The solid flange encircling the concrete pipe protects the pipe from breakage and forms the best method of permanently cementing the valve to the pipe.

We manufacture the original line of Irrigation Appliances, Outlet Valves and Cut-off Gates for the definite division of water over the field from Concrete Pipe Lines.

ALL unnecessary parts have been eliminated. The bolt is **Copper Plated Cold Rolled Steel, Square Thread, Machine Cut** and is of sufficient length to permit full opening without removing it and the lid. On 16-inch and larger sizes a stop nut is placed at the lower end of bolt to prevent removal.

WITH THE WATER COMPANIES

Of Interest Expressly to Water Works Engineers, Superintendents and General Managers

PRINCIPLES OF PUBLIC-UTILITY WATER RATE FIXING

By M. R. MacKALL

Hydraulic Engineer
State Railroad Commission
State of California

A PUBLIC utility water company operating in California may, at any time, file with the State Railroad Commission an application for an increase in rates, which can only be granted by formal order after the holding of a hearing open to the public. A request by a utility for a reduction in rates may be granted informally by the Commission without a public hearing, provided no discrimination results. As the reader may suspect, however, this removal of complications has not resulted in an epidemic of requests for lower rates.

The time required to render a final decision in a rate proceeding varies from one month to one year from date of filing, depending upon the size of the plant and the amount of work pending before the Hydraulic Division for investigation. It should be remembered that all affairs and complaints involving every public utility water system in the state are conducted by a department composed of but seven engineers. This is quite a task when it is considered that there are 431 public utility water companies in this state.

The matter of rate fixing and public utility valuation is highly complicated and involved and has an almost unending variety of problems peculiar to each individual case, many of them not as yet definitely settled by law or even practice.

WHEN application is made by a utility for rate adjustment a complete inventory of the entire properties should be submitted at the same time. If the size of the plant and the financial conditions of the company warrant, this inventory, as well as an appraisement of the properties, should be prepared under the direction of a competent engineer familiar with valuation matters. The engineers from the Commission, after checking the inventory, prepare a report giving an independent valuation of the properties and containing an analysis of the costs of maintenance and operation during the past for the purpose of determining the reasonable and proper expenses for the future. The report of the engineers of the Commission must be substantiated by the evidence and subject to cross-examination exactly as any other matters presented to the Commission.

The Commission has generally, in the past, adhered to the principle that valuations for rate fixing purposes should be based upon the reasonable historical or original cost of the investment in the physical properties which are being devoted to the public use at the time of the proceeding. Lands and rights of way, however, are appraised at the present market value. Consideration also is given by the Commission to the present value of the plant as determined by the reproduction cost of the properties less accrued depreciation. It is perhaps advisable therefore, especially from the standpoint of future financing, for any utility contemplating an application for an increase in rates before the Commission to present both an estimate of the value of the properties based upon the historical or original cost and upon the reproduction cost theory less accrued depreciation.

IN ARRIVING at a fair value for rate fixing purposes the Commission will exclude non-operative lands, structures and equipment. Intangible values such as going concern, development costs, working capital and water rights are also elements which must be given proper consideration. Thereafter, if conditions so warrant, a schedule of rates is designed to yield the utility a fair return upon its investment over and above the reasonable cost of operation, maintenance and depreciation. While a fair return under normal conditions is taken by this Railroad Commission at approximately 8 per cent in ordinary utility practice, yet the Supreme Court of the United States has frequently held that a return of 6 per cent may at times properly be held a fair return and will not amount to a confiscation of the properties of the company without due process of the law.

There are, of course, a great many exceptions to the granting of a full return upon the rate base as found. For instance, it frequently happens that in order to produce a fair return upon the investment a rate would be required which would be so high as to be prohibitive. Unfortunately this situation is by no means rare in the state of California, especially so far as water utilities are concerned. We have a great number of water companies which have been installed by real estate concerns primarily for the purpose of aiding in the sale of lots. When the real estate operations on many of these subdivisions have arrived at the point where they are no longer lucrative, the operator, if he cannot find a victim to relieve him of his public utility burdens, is required to continue the operation of his plant until such time as the territory develops to the extent where a fair return can be realized through a reasonable rate. There are many water systems starting out which are still in a development stage, and in justice to the consumers served by them are not yet entitled to a full return upon the capital invested. There are a great number of irrigation and domestic water concerns which have been the outgrowth of the old mining ditch systems of the early days where the territory served, formerly supporting flourishing communities, is reduced to the extent that the company is unable to meet bare operating costs.

The right of the Commission to fix a rate under these circumstances at a figure less than that which would give a full return upon investment, was recently questioned by one of the power companies in the southern part of the state, which took exception to the ruling of the Commission that the territory served was in a state of development. This matter was taken into the federal courts in California, and while dismissed, re-

sulting in a victory to that extent by the Commission, the dismissal was, nevertheless, upon a technicality and the real point at issue has not been settled by the United States Supreme Court.

A DECISION by the courts precluding any regulatory body from using its discretionary power in the fixing of rates would be a calamity and a death blow to public utility regulation. Any system of regulation, whether by courts or administrative bodies, which disregards the great economic principle that there is a limit beyond which the value of the service rendered can not go, is doomed to failure. Although the position of this company was primarily that of questioning certain findings of the Commission to the extent that the rate fixed was actually all that the traffic would bear, and while this company perhaps did not insist that the Commission should be deprived of all discretion in matters of rate fixing, the principle involved was, nevertheless unescapable, and if carried to its logical conclusion would result in the regulation of rates purely by mathematical formula.

The Commission has, in the designing of rate schedules, tried various methods of determining the charges to be paid thereunder. For a water company the fundamental need is to have a proper amount of money returned to it each year by way of revenues .It is, theoretically, at last, interested but interested in the manner in which these rates are spread among its consumers. Although the Commission has tried scientifically designed rate schedules, wherein it was necessary to depart from time-honored practice, such changes have created such storms of protest as to make the practical application of such rates hardly worth while. The Commission has, therefore, quite uniformly adhered to the simplest and most readily understood forms of rate structures.

The Commission has expreienced a considerable handicap in rate fixing by that custom of the early days in which the cities, in granting a franchise to a water company, would require that all water served to the city itself, including fire service, should be free. Investigations by the California Railroad Commission, as well as the investigations conducted by other regulatory bodies, have determined that the actual cost of investment for the delivery of water for adequate fire fighting purposes runs from 25 to 75 per cent of the entire plant investment. The cost of maintenance and operation of the system is increased proportionately.

The difficulty here, of course, lies in the fact that in order to deliver a large volume of water in a short period of time a greater capacity of distribution and transmission mains, as well as storage and standby equipment, is required than would be necessary for normal domestic service. This Commission, adopted at an early stage, the principle that free municipal service was unfair and discriminatory and should be abolished, and proceeded to fix rates to be charged municipalities for fire service, sewer flushing, and for other municipal purposes, upon the theory that the entire cost of operating and maintaining the additional investment required for these municipal functions should not be placed upon the shoulders of the regular consumers but should be paid for by the property owners who directly benefit thereby. While this principle was unpopular among city officials, who were more vitally interested in a lower tax rate than in equalizing the consumers' burden, nevertheless its fairness and reasonableness soon commended itself even to the municipal authorities, and the practice is now firmly established.

Newport Beach Lets Contracts for New Water System

Contracts that will total $280,000 were let in November by the Board of Trustees of Newport Beach, California, for the construction of an entire new domestic water system for the city. Leer Weber of Santa Monica was awarded the contract for most of the work, consisting of laying many miles of iron pipe line. His bid totaled $157,545.60.

The Chicago Bridge and Iron Company of Chicago was awarded the contract for a 50,000-gallon elevated steel tank at $5275.00.

The Pacific Tank and Pipe Company, Los Angeles, was awarded the contract for laying all-wood stave pipe lines for $61,246.77. Stroud Brothers and Seabrook, Vista, Cal., got the contract for trenching and backfilling, for $6338.50.

Bonds of $350,000 were voted by Newport Beach in September for the water system. It is designed to serve a community of 50,000 persons and is believed to be ample for the next twenty years.

Buys Water Land and Wells

Anaheim, California, is believed to have settled the problem of its domestic water supply for several years to come by the recent purchase, for a consideration of $25,000, of two acres of land within the city limits, which contain two deep water wells equipped to pump a maximum of 5,000,000 gallons per day.

WHO'S *WHO* AND WHO'S *WHERE*

IN IRRIGATION AND RECLAMATION

Personal Notes and Impersonal Observations About Men You Know

Paul S. Jones, who has been identified with water development in the Imperial Valley for many years past, has been appointed general manager of the Palo Verde Irrigation District.

A. L. Christiansen, county agent for the agricultural extension service in Tooele County, Utah, has been transferred to Weber County, and Lyman H. Rich has been appointed county agent in Wasatch County.

Two directors were named by the Central Oregon Irrigation District at its annual election in November. G. N. Dorn was named for a three-year term, and Frank N. Davis was chosen to fill the unexpired term of W. Van Allen.

Joe Jacob, incumbent, and R. S. Short were elected in November as directors of the Klamath, Oregon, Irrigation District. They were opposed by Charles E. Drew and G.H. Carleton. Their election followed a hot political fight.

A. C. Finney, state assemblyman from Imperial County, has been appointed associate counsel for the Imperial Irrigation District. He will assist Chief Counsel Charles L. Childers, who expects to spend much of his time during the next few months in Washington.

Rhea Luper, state engineer of Oregon, has been delegated by Governor Pierce to attend a conference in Washington, D. C., on December 14 and 15, called by Commissioner of Reclamation Elwood Mead to consider problems faced by the Bureau of Reclamation in the western and southern states.

Jay H. Upton, Oregon state senator, has announced his candidacy for governor of the state. Mr. Upton is an active irrigationtist, having served two terms as president of the Oregon Irrigation Congress. He has been prominently identified, during his legislative career, with irrigation legislation in Oregon.

Samuel Kahn, for the past twelve years vice-president and general manager of the Western States Gas & Electric Company, Stockton, California, has been elected vice-president and director of the Market Street Railway, San Francisco. He becomes general manager of the company as well.

William G. Talbot, of Los Angeles, general manager of the Los Angeles plant of the Western Pipe & Steel Company, died suddenly, following an operation early in December. Mr. Talbot was a prominent figure in business and club life of southern California, and one of the heads of an organization intimately connected with the construction side of irrigation.

The Deschutes, Oregon, Irrigation District, commonly known as the Tumalo, elected W. R. Gerking and C. M. Jones as directors at the annual election in November. The former will serve for a three-year term, and the latter will fill out the term of L. E. Daigler, resigned. The election of the Snow Creek District resulted in the choice of Edward Dean to succeed E. Pringle.

R. H. Tucker, former county agent of the agricultural extension service in Montrose County, Colorado, assumed a corresponding position in Delta County in December. He is succeeded in Montrose County by Henry A. Ireland, who has been agriculturist on the Uncompahgre reclamation project. The transfer of Mr. Tucker to Delta County gives that section extension service after a lapse of several years.

Forbes Fosberry and J. C. Calhoun were elected directors of the Grants Pass, Oregon, Irrigation District in November. William Hanley was chosen director of the Harney Valley district. E. F. Barnard was named to succeed himself as director of the Ochoco district. The Jefferson County unit of the Deschutes project named John Henderson as a director. George Cyrus was returned to office in the Squaw Creek District.

A party of representatives of California bond houses, including Thomas W. Banks, of Banks, Huntley & Co., John H. Dinkins, of M. H. Lewis & Co., and E. V. Carter, of Carstens & Earles, Inc., recently visited the Exchequer Dam and other developments on the Merced (California) Irrigation District. With them was H. C. Dinkins, Mexico City railroad man. The party was conducted over the district by Engineers R. V. Meikle and Ross White, and by Alger Fast, financial comptroller of the district.

Thirty-three prominent business men of Los Angeles recently staged a friendly invasion of Arizona for the purpose of getting acquainted with the state's resources and problems, and of promoting plans for Arizona-California colonization and co-operation. The party included R. W. Pridham, president of the Los Angeles Chamber of Commerce, William Lacy, chairman of the Arizona relations committee of that organization, W. T. Bishop, former president, D. W. McGarry, vice-president, and seven directors.

Sixteen irrigation districts in Yakima County, Washington, will hold their annual elections early in December. Districts included, and the retiring officers are: Wenas, R. C. Babbitt, president, J. B. Fink and Guy Longmire, trustees; Selah-Moxee, Ovid Brulotte, president; J. D. McAuley and William Meiras, trustees; Yakima, L. O. Janeck, president, Merritt Longmire and Charles Cowan, trustees; Terrace Heights, Ed Remy, Jr., president; Charles Westaby and J. Reutter, trustees.

Yakima-Tieton, H. M. Gilbert, president; Dan Williams and W. I. Huxtable, trustees; Sunnyside Valley, Frank Fyfe, president; E. C. Houston and R. J. Core, trustees.

Granger, J. E. O'Brien, president; O. J. Chapman and George Eaton, trustees; Yakima-Reservation, F. A. Wiggins, president; Harry Jones, Otto Halverson, Lloyd Purdin and E. J. Flannigan, trustees.

Appraisers of Vale District Classify Lands in Report

Appraisers appointed to investigate and evaluate the lands of the Vale, Oregon, Irrigation District, named under the Fact Finders Act, have completed their work and filed their report. B. E. Hayden, representing the government, J. D. Fairman, for the district, and Ross Madden, selected by the two first named as a third member of the board, were the appraisers.

They found within the boundaries of the district a total of 40,342 acres, according to the report. Of this they excluded a total of 10,656 acres, including 9,575 acres of good fertility but too rough for practical irrigation and 1,082 acres which are alkaline.

Of the remainder of the area the board found 27,215 acres of raw land, and 2,851 now being farmed.

The report does not place values on the farmed land, but classifies the raw land as follows:

Special class: "Lands of such high grade and so smooth, that we could not in justice ask class A lands to measure up to their standards, and therefore were classed by themselves," 1,510 acres, valued at $15 per acre.

Class A. Lands of high fertility, smooth and free from breaks and washes, 10,405 acres, value $13 per acre.

Class B. Lands of high fertility, but rougher or more sloping than class A, 8,285 acres, value $9 per acre.

Class C. Lands of good fertility, but rough; or level lands of lower fertility; 7,014 acres, value $5 per acre.

Class D, rough. Lands of good fertility, but too steep for practical irrigation, railroad rights of way, beds of streams, etc. 9,575 acres. No value determined.

New Book Treats Drainage

"Drainage and Flood Control Engineering" is a new work on an important branch of hydraulic science which has recently come from the presses. The author is George W. Pickels, Associate Professor of Drainage Engineering at the University of Illinois. The book presents the fundamentals of drainage and flood control engineering as applied to the improvement of small areas of cultivable land and to the reclamation of large areas of wet and overflow lands. It emphasizes the new importance of hydrology, hydraulics and soil physics in the design of drainage systems and treats the essentials of these subjects from the viewpoint of the drainage and flood-control engineer. Copies may be ordered through MODERN IRRIGATION, at $4.00 postage prepaid.

One Pump

ONE PUMP is really the output of the Peerless Pump Plant, for every one of the thousands we have turned out has had the utmost careful attention as tho it was the one pump we would manufacture!

Every bearing is constructed of the finest materials, every runner is balanced accurately, and every finished pump is subjected to rigorous tests both in the factory and in the field. The result is Performance and Permanence.

For 7" Wells or larger
Capacities from 180 to 3000 Gallons Per Minute

RECLAMATION

FACTS FOR THE PROSPECTIVE PROJECT SETTLER

RESULTS of a recent investigation conducted by the U. S. Bureau of Reclamation, to determine facts connected with the worth of land, financing facilities, and capital requirements on each of the federal reclamation projects, are presented in the November issue of the NEW RECLAMATION ERA, official publication of the Bureau. The table on this page is a part of the data given by that publication, and the complete report as it appeared in the NEW RECLAMATION ERA follows:

The Reclamation Bureau recently called for information concerning the price of improved and unimproved land on the projects, the best size of farms, the cost to improve and equip the farm, and the amount of capital needed by an experienced settler, exclusive of the purchase price of the farm, in order to succeed on an undeveloped farm. The replies, as far as received, are summarized in the accompanying table.

SETTLEMENT AND FINANCIAL DATA FOR FEDERAL RECLAMATION PROJECTS, AS COLLECTED BY THE RECLAMATION BUREAU

Project	Price of private land per acre		Best size of farm (Acres)	Cost to improve and equip farm	Amount of capital needed by experienced settlers, not including purchase price of farm
	Improved	Unimproved			
Yuma	$150-$ 250	$ 50-$150	40	$3,000-$5,000	
Orland	250- 750	125- 150	20	5,000-10,000	$5,000
Grand Valley	90 150	20- 50	40-60	2,000	3,500
Uncompahgre	50- 250	20- 100	40-60	2,100- 4,600	2,000- 5,000
King Hill	35- [1]150	[1]15	40	5,000	
Minidoka	75- [1]150	50- 75	40	4,000- 5,000	3,000
Huntley	75- 150	10- 50	60-80	6,000-10,000	3,000- 5,000
Milk River	30- 75	15- 40	80	3,000- 4,000	3,000- 5,000
Lower Yellowstone	40- 125	20- 50	80	3,000	2,500
North Platte	70- 200	40- 100	80	6,500	5,000
Newlands	150	20	40	4,000	4,000
Carlsbad	75- 250		60-80	3,500- 5,200	4,000
Rio Grande	150 250	75- 150	20-60	2,000- 5,000	2,000- 5,000
Umatilla	150- 200	30- 50	40	8,000	5,000
Klamath	125	20	40-100	4,000- 7,000	1,500
Belle Fourche	40- 125	20- 50	80	4,000- 6,000	2,500
Strawberry Valley	100- 200	75- 100	40	2,000- 3,000	2,000- 3,000
Okanogan	500- 1,000	100- 150	5-10	3,500- 7,000	2,500- 5,000
Yakima	800 2,000	40- 75	20-80		5,000- 7,000
Riverton		15- 25	80		2,000- 5,000
Shoshone			60-80	4,000	2,000- 4,000

[1]And up.

An additional question covered the sources from which settlers can borrow money to supplement their capital to develop farms, the length of payment period, and interest rates. Information on this important point was furnished by the projects as follows:

Yuma project, Arizona-California.—Local banks loan money on crop mortgages or under certain conditions as second mortgages upon the farm at rates of interest running from 8 to 10 per cent. Generally these loans are short time loans upon crop mortgages. The loan is made in the spring or summer and is paid out of the first returns of the crop.

Orland project, California.—Settlers can borrow money from the Federal Land Bank of Berkeley, Calif., the Pacific Coast Joint Stock Land Bank of San Francisco, and private banks, all of which make loans on practically the same terms offered by the Federal land bank, whose terms are 5½ per cent on a loan extending over 31 years.

Grand Valley project, Colorado.—Very few agencies are furnishing money on farms for farm equipment. Most of the land sold for the last few years has been with a small down payment and three or five years for the balance. The deferred payments usually bear interest at 8 per cent, with an occasional loan at 7 per cent. Money is available for short chattel loans from local banks, with a usual period of six months and at the rate of 9 or 10 per cent. The best merchant paper well secured carries an 8 per cent rate.

Uncompahgre project, Colorado.—Available sources of loans are banks, loan companies, and individuals. The farm-loan bank is not at present operating in the valley under the project. Loans are usually made for a period of three years, occasionally for five years, the rates averaging 8 per cent for real-estate mortgages and 10 per cent for chattel mortgages.

King Hill project, Idaho.—At the present time money can not be obtained on the project farms; and farms in the making stand less chance of obtaining credit. Short-time money is loaned to some extent on crops and chattels, and the usual rate is 10 per cent, although lower in some instances.

Minidoka project, Idaho. — Long-term loans can usually be obtained from mortgage companies and sometimes from the land banks. Short-term loans on crop mortgages can be obtained from local banks. The prevailing terms and rates for real-estate loans are five years' time and 8 per cent interest. Local banks charge 10 per cent interest on chattel and crop loans, the usual term being three to six months. Renewals can usually be obtained where security is good.

Huntley project, Montana.—It is very difficult to borrow money at this time. About the only available source is the Federal land bank. The repayment period covers 33 or 34 years, with interest at about 5½ per cent.

Milk River project, Montana.—The right sort can borrow locally, but must show that they are workers and know how to farm under irrigation. Payment period, 10 years; interest 6 per cent.

CONSIDER. A machine moving practically a continuous flow of dirt. A continuous line of digging, shaving, cutting buckets; filling and ejecting twenty-two buckets a minute of dry earth, adobe or clay. In water, taking with every cut, small willows, tules, water grass and all other small growths, along with a clean, shaving of the bank.

Each bucket filling and emptying clean, one-ninth of a cubic yard of dirt, every time around. In an average day, under average conditions, the Ruth cleans out 1,500 cubic yards of canal earth, leaving a clean cut, smooth faced bank. The capitulation below gives more detailed costs and capacities.

Truly, we claim that with the Ruth bucket and its Ruth Ejector, the Ruth Super Crawler Dredger is the only machine of its kind today, in its particular field of irrigation, reclamation and drainage ditching.

Why dig a ditch, then let it grow up with weeds, when the Ruth will keep it clean and in better shape than when new, at such a low cost?

Write us fully today of your irrigation, reclamation or drainage problems. We will help you.

Tell Us

How many miles of canals in operation or to be constructed?

Is it irrigation or drainage?

How many acres reclaimed or to be reclaimed?

In dry earth—in running water—at any slope, The Ruth automatically digs and cleans smooth even ditches.

Lower Yellowstone project, Montana-North Dakota.—The Federal land bank does not favor loans on this Government project and the local banks can handle only small amounts of short-time paper. The interest rate is 10 per cent on this class of loans.

North Platte project, Nebraska-Wyoming.—Money to supplement capital can be borrowed at local banks and from loan companies. Such loans usually run from one to three years and bear interest at 8 to 10 per cent.

Newlands project, Nevada.—"It is impossible for a settler to borrow money on his homestead until he has secured a patent from the Government."

Carlsbad project, New Mexico.—The best source is the Federal land bank, which loans up to 50 per cent of the estimated value of the farm. The length of payment period is 34 years, and the interest per annum, including payment on principal each year, amounts to 6 per cent.

Rio Grande project, New Mexico-Texas.—Federal farm loan banks operate in both districts of the project, and loans are made from such source in reasonable amounts.

Umatilla project, Oregon.—There is no available source at present where money can be borrowed to develop a farm. Money is available only for improved places. For example, if a settler were to level 40 acres of land and build his flumes or ditches, he could not borrow money on his farm. If, however, he had enough capital to get a good stand of alfalfa on 20 acres, he might get a $1,200 loan on a first mortgage. Private capital is out of the market for loans on irrigated lands.

Klamath project, Oregon-California.—Local banks help finance those able to show material and moral assets. Ordinarily notes run 90 days to 6 months, sometimes 9 months. The interest rate is 8 per cent.

Belle Fourche project, South Dakota.—Local banks have restricted loans to such an extent that only the best farmers with Class A security can obtain short-time loans. The Federal land bank and larger loan companies are not operating on the project, and the State rural credit has suspended activities.

Strawberry Valley project, Utah.—Farmers are usually financed through local banks. Seasonal loans for six months are obtained at 8 per cent interest; mortgage loans for 5 to 10 years bear 7 per cent; and the Federal Land Bank of Berkeley, Calif., makes long-time loans over a period of 34 years on the amortization plan at about 5½ per cent.

Okanogan project, Washington.—Local banks and mortgage companies are the sources for loans to supplement settlers' capital. At present real estate loans are difficult to secure. Mortgages run from 3 to 10 years, with the average interest rate about 8 per cent. Short-time loans are made at 9 and 10 per cent.

Yakima project, Washington.—Money may be borrowed from private loan companies on unimproved land of good quality; and the Federal land bank and mortgage loan companies loan reasonable amounts on improved land at varying rates from 5 to 8 per cent.

Riverton project, Wyoming.—Settlers of good character on unimproved land whose farm equipment is unencumbered can get money for seed and similar purposes from local banks on chattel mortgages for a term of six to nine months at 8 to 10 per cent interest.

Shoshone project, Wyoming.—At the present time it is doubtful if a new settler could borrow money to supplement his capital. The local banks have loaned to the limit. The State of Wyoming has appropriated $2,000,000 to be loaned to farmers of the State under a 30-year 5 per cent amortization plan of payment, but as yet none of this money has been placed on the project.

Reclamation Bureau Makes Annual Report to Chief

Financial Policies are Most Difficult Problems, says Mead; Requests for Deferments are Considered

The annual report of the Commission of Reclamation, submitted early in December to Hubert Work, Secretary of the Interior, by Commissioner Elwood Mead, declares that the fiscal policies of his bureau during 1925 constituted the most pressing and difficult problems encountered.

Thousands of requests for deferment of payments due the government were received from water users, were entitled to sympathetic consideration and received it. The deferments amounted in the aggregate to a large sum. Commissioner Mead states, however, that there were other requests to approve which would abuse the Government's generosity. Requests from irrigators amply able to pay, from non-resident landowners whose farms are cultivated by tenants, and from those who openly oppose all payments to the Government, had to be refused.

During the last five years there has been a progressive decrease in payments made on certain projects. Delinquencies for that period amount to the staggering total of $8,500,000.

Commissioner Mead points out that the theory of Federal reclamation is that it shall be self-supporting. The money

For Detailed Listings, Branch Offices, Etc., See the Buyers' Guide to Leading Supply Sources—Pages 55-56

spent to build irrigation works is to be returned to the Government. Water users are to pay all the costs of operation. This theory is not only sound, but it is the only one under which the policy of Federal reclamation can be justified. The Bureau of Reclamation is working to make this theory a fact.

Seven projects are characterized as a source of confidence and satisfaction, having paid more than 85 per cent of charges and assessments. Seventeen have paid more than half. The payments of the remainder are so inadequate and the morale of settlers on some is so low that measures to check this downward course toward insolvency are held to be imperative.

Insistence on payments, instead of discouraging the water users, has increased their confidence and has had a great influence in maintaining the morale of the administration of the bureau, the report declares.

Williston Sale Authorized by Interior Secretary

Sale of the Williston Reclamation project, located at Williston, North Dakota, for the sum of $151,388 has been authorized by the Secretary of the Interior. The plant is to be sold to the United Power Company of Crosby, North Dakota. This company made the highest of five bids publicly opened at Williston on November 2. According to the terms of the sale as approved by the Secretary, the $151,388 will be paid in 20 annual installments of 5 per cent each with interest on deferred installments at the rate of 6 per cent.

The company also agreed to pay at the rate of 20 cents for each ton of coal mined from the Government coal mine owned and operated in connection with the power plant of the project. The next highest bidder was Daniel R. Croswell, Brainerd, Minnesota, whose tender was $80,000. A group of six water users of the project offered to pay $150 per year for a period of ten years.

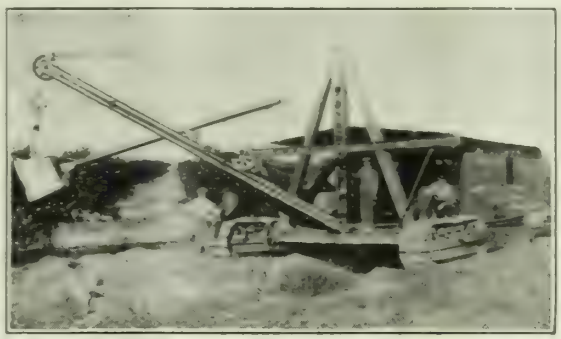
Congress authorized the appraisal and sale of the Williston project last Marrch as this was one of the projects which has been operating at a loss for many years. The original construction cost of the project was approximately $470,000, of which none has been repaid the Government.

The Interior Department also announced that the project headquarters in Williston and a small tract of land near Buford, North Dakota, would be offered for sale. The property was ordered appraised and later will be sold through competitive bidding.

For Cleanout -- Maintenance -- New Ditches

There's a Bay City for Every Job

BAY CITY Land Dredges span the ditch, can dig any desired slope, and dump waste on both banks. BAY CITIES leave clean, wide berms, and can work up or down streams. One trip over the ditch is enough. The Shovel Type Dipper handles hard material in which other types of buckets cannot make a good showing.



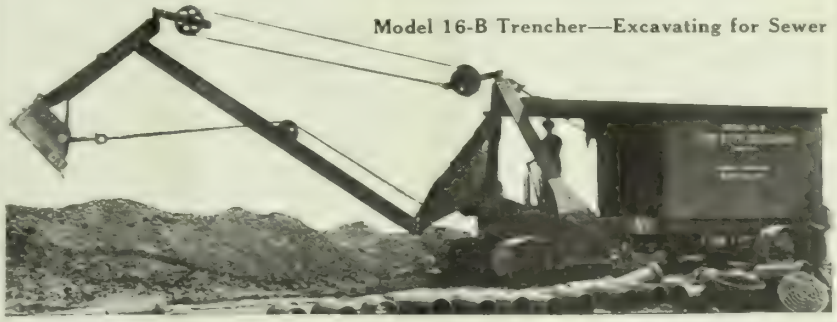
At left—One yard BAY CITY Dredge digging and cleaning ditches in Florida Citrus Groves.

BAY CITY Land Dipper Dredges are built to fit the job. Walking, Crawler, Track or Floating mounting. Easily dismantled, transported and assembled. Capacities ½ to 1½ cubic yards. Oil engine or electric operation.

FOR SMALLER DITCHES — OR PIPE LINE TRENCHES

The BAY CITY 16-B convertible Excavator will handle a wide range of work. Operates Dragline, Trench Shovel, Clamshell or Skimmer. All steel. Shipped assembled. Digs any width or depth up to 20 feet.

Model 16-B Trencher—Excavating for Sewer



or—Model 4 Excavator

BAY CITY Model 4 is a small low-priced convertible, one-man operated Excavator. Fills the gap between hand labor and high priced equipment. Capacity 20 to 40 cubic yards per hour. Gasoline or electric power. A Real Digger economically designed for the small job. Also operates shovel, and clamshell.

IRRIGATION FINANCE

A FARM LOAN BANK PRESIDENT LOOKS AT IRRIGATION

By GEORGE C. JEWETT

President, Federal Land Bank, Spokane, Washington

THE Federal Farm Loan System is designed for the development and betterment of agriculture, and the Federal Land Bank of Spokane is anxious to serve in this respect. We appreciate fully the great benefits that reclamation has brought, and we further appreciate that some of the very best loans that are available to any mortgage company are those which have, as their underlying security, irrigated lands.

In our judgment there is only one matter to be considered in contemplating such loans, but that is a big matter and one of great importance. It is as to the soundness of an irrigation project, both physically and economically. When we say physically, we refer to its physical features such as the adequacy of its water supply, the permanence of its dams, laterals, canals, etc., and the character and topography of the land to be irrigated and the possibility or probability of dangers from seepage, necessitating drainage.

These, as every irrigationist knows, are fundamental factors, and in determining the value of irrigated lands must be carefully analyzed and taken into consideration.

THE ECONOMIC factors are of like importance, and refer mainly to the operation and maintenance charges, the bonded indebtedness, the character of the production and the income derived therefrom. There is a fixed relationship between each of these factors, and it must be in proper proportions. Operation and maintenance is always a matter of relative character as measured against the income that the land can be expected to provide. In some sections of our territory, an overhead charge of 50 cents per acre for a season might be considered excessive inasmuch as the land, on account of soil and climatic conditions, might be of a low income character, and that small charge might be out of proportion, while, on the other hand, in some parts of our district an overhead charge of from $8.00 to $10.00 per acre might not be treated as excessive, owing to the productivity of the land and the high money value of the crops that the land is best suited to produce.

These are matters familiar to everyone interested in irrigation, but we must confess that sometimes they appear to be overlooked. It is not a criticism of reclamation or an indication that we are not believers in reclamation when we say and point out that there are many irrigation districts in which the Federal Land Bank operates that should never have been formed. There are many in which the physical factors are unsound, and can but mean disaster in the final analysis. There are many more in which the economic factors may be said to be impossible.

MR. JEWETT, as president of the Federal Land Bank in Spokane, Washington, is naturally most interested in the irrigation and reclamation problems of the northwest, and throughout the accompanying article refers to "our district", meaning the territory served by the institution which he heads. Many of the points with which he deals, however, in addition to having a special application to northwestern problems, will apply with equal force to other irrigated areas; and the suggestions which he makes concerning the organization of the marketing end of the industry, and the credit facilities provided for irrigation farmers through the Federal Land Banks and Federal Intermediate Credit Banks, touch vital questions which are encountered in irrigation wherever it is practiced.—Editor.

TO FORM a district or a project and offer it to the farming public where the operation and maintenance is out of proportion to the possible income, and where the bonded indebtedness for reclamation and construction charges is in excess of a fair valuation for the land, is but injuring sound irrigation, and placing a damper on the development of future projects. The Land Bank has many of this character of districts or projects to contend with, and, of course, as a sound money loaning institution, it is compelled to withhold its services from such territories.

Another factor which we must take into calculation, and which is a very important one in making loans in any irrigated territory, is the relationship that cultivated productive acres bear to the total acreage under the project. The cultivated productive acres are the only ones producing an income of a substantial character, and therefore must bear the burdens incident to the operation and maintenance of the district, bearing not only their own burden on an acreage basis, but bearing that portion that would be borne by the uncultivated acres if they were in a productive condition. This factor alone has compelled us to withhold our service from a number of districts where the area of non-producing land was quite extensive.

We are sure a number of districts have met with disaster for this very reason alone, as the burden on the cultivated acres, taken by themselves, was so great that the owners and operators of same were unable to succeed, and therefore permitted the charges to go uncared for, and eventually were compelled to abandon the lands.

AS I TRAVEL over irrigated areas in our district, I am continuously reminded of the fact that soil and climatic conditions are such that a high production is assured. It is very seldom that any district fails to produce an abundance of crops for which the district is best adapted, but I regret to say that that does not necessarily mean a proper income for the district. I refer specifically to the matter of markets. We find, in this territory, an abundance of crops, which in many instances are moving at an unsatisfactory price, and other crops that are not finding a market at all. There is no matter so important to American farming and those who are depending upon that industry for their suc-

cess, as the one of proper markets. Experience has taught us that we can increase our values and better justify our markets in territories where the farmers are organized with sound cooperative marketing institutions, and therefore have a better assurance that their production will result in a proper money income.

There is only one way out, insofar as this problem is concerned, and that way must be taken by the producers themselves. It is to do, in short, as other territories have done, the best example being found in California, and organize their own cooperative marketing institutions. It is often said that farmers' cooperative marketing institutions cannot succeed, and it is pointed out that many have failed; but that is true of any enterprise, and while many have failed, many are succeeding and have caused conditions in the territory they serve to change from highly unsatisfactory to highly satisfactory. Those interested in the development of reclamation can well afford to also devote their attention to the development of better marketing facilities, and better markets.

The Federal Farm Loan System is now supplemented through the Federal Intermediate Credit Banks, which are designed for financial service to farmers covering an intermediate period; that is, a period longer than the average commercial bank desires to loan for, and a period not so long as the farm mortgage loan that the Federal Land Bank handles. The Federal Intermediate Credit Bank of Spokane is rendering aid to the dairy industry, livestock industry, cooperative fruit associations, and cooperative wool associations. They have a loan that is fitted to the needs of these organizations, and they are anxious to extend their service in every legitimate way that may be provided.

Most certainly with the Federal Land Banks and the Federal Intermediate Credit Banks, the farmer has at his call the very best in the way of service that is available to any industry.

Oregon Pays Bond Interest

A check in the amount of $44,561.95 was sent by the state treasurer of Oregon to the National City Bank of New York on November 30 to meet interest on Oregon irrigation district bonds which are guaranteed by the state.

Oregon Drainage Body Meets

The Oregon State Drainage Association will meet at Salem December 15. One of the matters to be considered by the organization will be a proposal to consolidate with the Oregon Reclamation Congress. A resolution will be introduced at the meeting urging the federal government to return to the state of Oregon for reclamation purposes, at least, a large part of the $6,000,000 derived from the sale of public lands in that state.

Guarantee Eagle Point Bonds

The Eagle Point (Oregon) irrigation district has been granted an extension of interest guarantee of six months by the Oregon irrigation and drainage securities commission, during which the state will continue to guarantee the interest on the district's outstanding bonds, amounting to $400,000. It was announced that if the district would demonstrate that it had a practicable settlement plan, looking to the colonization of the project, the interest guarantee would probably be further extended. The Eagle Point district is located in Jackson County, and includes approximately 5,000 acres of land.

Sells $600,000 Issue

The Camas Mutual Irrigation District (Idaho) has sold a $600,000 bond issue to New York financiers. The funds will be used in the construction of a dam, canals and laterals for the irrigation of a tract of 11,000 acres in Clark County. Terms of the sale contract as reported in the press stipulate a first payment of $120,000 in April, when construction work will be commenced, followed by payments of like sums at intervals of two months until the whole amount is paid.

Water Bonds Bring Premium

An issue of $500,000 4½ per cent San Dieguito water bonds were sold in November by the city of San Diego to the Detroit Company and the Old Colony Trust Company, whose joint bid of par, plus accrued interest, plus a premium of $1363, was the highest of several tenders submitted. The half-million dollars will be used by the city as a payment on the option to purchase the San Dieguito water system.

La Mesa Bonds Bring 97.76

A million and a half dollars in bonds of the $2,500,000 issue of the La Mesa, Lemon Grove and Spring Valley irrigation district, California, was sold in November to a syndicate including Pierce, Fair & Co., Hunter, Dulin & Co., First Securities Co., M. H. Lewis & Co., California Co., and Banks, Huntley Co., all of Los Angeles, at 97.76. Three other bids from irrigation bond houses were submitted, ranging from 95 to 96.75.

How About Credit?

(*Continued from Page 18*)

trict can not be successful. On the other hand, the officials of the district should take a personal interest in the problems of the landowner and the individual farmer. There is much that the officials can do to assist the farmer to become successful in his farming operations. Water users should realize that it is impossible to maintain a successful project unless taxes are paid promptly. Many district boards will not deliver water to water users until their taxes are paid.

Prompt payment of irrigation taxes will mean success to any project if properly managed, while on the other hand if taxes are allowed to become two or three years in arrears, the accumulated taxes together with ten to fifteen per cent interest will make such a burden that the average landowner can not succeed. The tax sale does not cure the situation by any means. While the district receives the money when a tax sale is taken, the officers of the district know if the tax sale is for a considerable amount that in many instances a good farmer is eventually forced to leave the project. This same farmer, if required to pay his irrigation taxes each year before receiving water, would in most instances manage to do so and would finally succeed.

Trenching and Backfilling

(*Continued from Page 19*)

special 2½-ton capacity truck. This 800-gallon-per-minute pump is unique, in that it requires no suction hose, pipe or priming, it being only necessary to connect up the discharge hose, push the button and the pump does the rest. At the same time it generates enough current for a large number of ninety-candle-power lamps. This piece of equipment was designed and assembled in the Department machine shop.

All repair work and overhauling is done in the Department machine shop and there is not one unit of this trenching and pipe laying equipment that is not doing its bit toward furnishing the people of Los Angeles with the most necessary of all commodities—domestic water.

Avocado Growers Meet

Avocado growers of Orange County, California, met on November 28 at La Habra for their fourth annual field day. Experts in irrigation and other phases of the culture of avocadoes discussed problems affecting the growers. J. B. Brown, irrigation specialist of the University of California College of Agriculture, spoke on "Contouring and Terracing for Hillside Irrigation."

Irrigation Men Prominent in Road Show Attendance

Heavy Duty Equipment Displayed at All-Western Exhibit Interests Hydraulic "Prospects"

Although the All-Western Road Show, held in San Francisco November 9th to 14th, was primarily designed to interest the street and highway builders of the eleven western States, manufacturers of much of the equipment found a very interested portion of the daily attendance composed of irrigation and reclamation engineers, and officials of irrigation districts.

A number of these companies were able to report sales in a field not classed as road building, but nevertheless greatly interested in the same equipment that the purely road building specialist uses.

Several pieces of heavy equipment, notably draglines, cranes, shovels and scrapers were sold from under the big tents, to be put to work on irrigation tasks. Prospects for the larger types of concrete mixers to be used in hydro-electric projects were carefully listed by this group of manufacturers.

The show itself, the largest exhibition of excavating and ground working machinery ever held, assumed a total of almost three million dollars worth of equipment, housed under the five acres of spread canvas on the San Francisco Marina. Back of the project was the Western Construction Equipment Distributors Association, with P. H. Curtis, Tracy Harron, Charles A. Spears and Edward R. Bacon as the active leaders of the entire project.

Problems of Power and Water

(*Continued from Page 17*)

When the eventual development has been reached, there will be several dams and power plants on the river; and a comprehensive plan of operation of the plants on one system, or on interconnected systems, will make it possible to suit both power and irrigation requirements without waste, by proper regulation of the flow between the successive reservoirs. The reservoir at the lower end will be regulated to suit irrigation and flood control demands below it; and those above it will regulate mainly in the interest of power.

On This Month's Cover

The tint picture on this month's cover shows work in progress on the Exchequer Dam, on the Merced River, California—one of the great projects now going on in the west. Completion of the dam is expected early in February, 1926.

MODERN Irrigation

Have You a Delegate at This Meeting?

THE COMPETITIVE business world of today moves forward on two wheels. One of these is salesmanship proper and the other—*advertising*. Whether you realize it or not, business amounting to billions is now transacted annually through the advertising pages of magazines and industrial publications. It is *here* that the preliminary skirmish of competition takes place and many a silent victory is won, or nearly won, before the salesman calls.

The advertising pages of MODERN IRRIGATION are a market-place. Here, once each month, is held a sales convention on paper. Here representatives of the leading equipment manufacturers speak their messages to the great market that buys your products.

These "silent salesmen" are an indispensable part of the general campaign; as necessary in their way as is the personal representative who stands between you and your customers, and your prospective customers. Do not, like the fabled ostrich, hide your head in the sand and imagine otherwise. You may, by cultivating such an illusion, go on saving the cost of a monthly advertisement; but if that is your policy you are slowly and certainly losing prestige, business and good will—of a far greater value to you—and making it easy for the more astute competitor, who does not believe in such limitation of armaments, to penetrate your market, overcome advantages which you hold in fancied security, and eventually outflank you on this important sector.

At this moment, the pages of MODERN IRRIGATION are being examined, and examined carefully, by men whose yearly purchases in your line aggregate large sums of money. Long-pull advertising will help you to secure a larger percentage of this annual turn-over. The men who buy are reading and studying these advertisements—never doubt it. Consciously, or unconsciously, they are forming their opinions and narrowing down their ultimate choice of equipment. Many *actual decisions* are made months in advance of the order for the goods. None but the most backward companies in business today are not fully alive to this, while those of seasoned advertising experience are now, as never before, bringing up their advertising artillery for the big year's business ahead.

There will be no disarmament in the business world the coming year—no unpreparedness in the organizations of progressive business concerns. Competition will be keener than ever before. The personal skirmishes and "bouts" of your salesmen and distributors in the field will have their counterpart in the drive for business and prestige through the advertising pages. Laggards and sluggards will drop out, and fall by the wayside. Live, up-and-going companies will go forward on "both wheels."

Think the matter over. The monthly meeting on these pages will go right on, month after month, and the silent but efficient emissaries of the leading companies in your line will be present. Your own advertisement gives you representation according to your merits. Why not decide upon a campaign now, and let us talk the subject over with you?

We'll be glad to introduce your "Silent Delegate" at the next monthly meeting.

OVERHEAD IRRIGATION

A PACKING-HOUSE MANAGER COMMENDS 'OVERHEAD'

By HUGH CRANE

WE WERE sitting in the manager's office at the packing house of the Sierra Madre-Lamanda Park Citrus Association—Frank Weber, the manager of the packing house, and the writer, who had gone to him for some information on how a packing house manager regards overhead equipment for citrus growers.

A member of the association entered to discuss some matter of fumigation or spraying with the manager. Mr. Weber, hoping to get a new slant on the problem for me, asked him: "Jim, do you have overhead irrigation on your place?"

The reply from the grower seemed characteristic of the attitude shared by many of the citrus growers in southern California, especially in the territory served by this particular citrus association.

He answered: "Not yet."

"Not yet" is the feeling of a great many of those who are interested in overhead equipment. "Not yet" implies "I'm sure going to have it when I can." It also carries just a hint, perhaps, of: "I'll put it in as soon as some of the questions connected with it are answered to my entire satisfaction—questions which are still open because of the youth of the overhead idea." But it augurs well for the future of overhead.

ABOUT A DOZEN members of the Sierra Madre-Lamanda Park Assocation have their ranches equipped with overhead sprinklers The association includes about 1,600 acres in its membership and approximately one-tenth of this is overhead-equipped. Most of this acreage is in small ranches, usually about ten acres. Two twenty-acre orchards are overhead ranches.

While ten per cent of the association's acreage is not a large proportion, it is, at least, a fairly representative share, and it is for that reason that the writer sought Mr. Weber for his ideas on the merits of the overhead system.

I put the situation before him like this: "Mr. Weber, I am interested in the subject of overhead irrigation. I have heard from various sources that it is a wonderful thing. Men who are enthusiastic about it have told me that it has numerous advantages, for many purposes. They have said that it improves the quality of the fruit, that it increases the proportion of fancy grades, that it reduces evaporation, that it protects against damage from wind and heat, that it reduces frost danger, etc., etc. On the other hand there are the men who admit that it has certain of these advantages, but who are extremely skeptical about the others. What I should like to get is something definite, free from mere matter of opinion, estimates, guesses, individual judgment—something based on definite records that speak for themselves. What can you give me?"

MR. WEBER replied: "I'm sorry that I can't give you very much. While it is true that we have a comparatively large acreage of overhead in this association, and that this method of irrigation is apparently becoming more popular with our members, and I have some very definite ideas on it based on my observation of its results, I can't give you data of the kind you want. And this is the reason: In every case our growers who have the sprinklers have their entire holdings so equipped. In order to make a comparison between the fruit grown under overhead systems and that irrigated by the old furrow system, it would be necessary to make records of the performance of two parts of the same ranch, where the irigation was substantially the only difference in cultural methods. This has not been possible in this association because where a grower has installed the overhead equipment he has usually had only a small acreage and has put his entire ranch under the sprinklers. Comparisons between the yields of one grower practicing furrow irrigation and another who has the overhead equipment would be valueless, and therefore they have not been made.

"Neither overhead irrigation nor any other *one* thing will give good fruit and success in citrus growing if the general cultural methods are not right, and there are too many variable factors as between different soils, different stocks, different growers and their different methods of pruning, fumigating, spraying, cultivating, and other elements of culture, to make valid conclusions possible based on comparisons between them.

"I have formed some very definite conclusions, however, based on my observation of overhead irrigation in this association. It was first called forcibly to my attention several years ago when I noticed that a picking of fruit from a rancher in the La Canyada district was remarkably free from 'tree-ripe.' I inquired into this and found that he had overhead equipment.

"I watched his subsequent pickings, and found that they were consistently free from tree-ripe lemons. He ascribed this to the influence of overhead, and as I have found that it is generally true on all our overhead acreage, I have no doubt that overhead sprinkling does eliminate the objectionable tree-ripe fruit, and brings the lemons to the packing house showing a very desirable uniformity of color.

"I believe also that it improves the quality of fruit in other ways, giving a smoother, firmer texture, and giving the grower a measure of control over unforeseen difficulties that sometimes occur to reduce the proportion of high grade fruit in his crop.

"I am thoroughly convinced, also, of this—that it gives better results with less water on light, foothill soils, which are characteristic of much of the acreage in this association, than can be obtained under furrow irrigation.

"I am like some of the critics of whom you have spoken in questioning its value as to some of the claims that are made for it. I think that there is little doubt that its value for frost protection is negligible. It may be of some slight assistance in raising the temperature under conditions of a very light frost, but such a cold snap would not amount to anything, anyway. I also question its efficacy in the control of pests. But as for its usefulness for the growers in this district whose soils are of the light, foothill type, why, they are finding it a great success."

We make complete installation if desired

This new Sprinkler will practically last a lifetime. We guarantee it unconditionally for five years.

BOOKS *of* PRACTICAL VALUE *to the* WATER USER *and the* HYDRAULIC TECHNICAL MAN

IRRIGATION ENGINEERING

By ARTHUR POWELL DAVIS, D. SC.

Chief Engineer and General Manager, East Bay Municipal Utilities District; formerly President Am. Soc. C. E.; formerly Director and Chief Engineer, U. S. Reclamation Service.

AND

HERBERT M. WILSON, C. E.,

Mem. Am. Soc. C. E.; former Chief Engineer and Irrigation Engineer, U. S. Geological Survey.

Seventh Edition, Revised and Enlarged; Total Issue 12,000

THIS IS a rewritten and rearranged edition with much new material added. The principal difference introduced is the treatment of soils, plant food, operation and maintenance, and other lines of work where the duties of the irrigation engineer come in contact with the irrigator, such as in the preparation of land, the duty of water and its application to the land. A bibliography of standard works is given at the end of each chapter. 640 pages. 6 by 9. 249 figures and illustrations. Cloth, $4.50 net postpaid. Remittance must accompany the order. Allow from one to two weeks for transmittal of order and shipment from the publishers.

IRRIGATION PRACTICE *and* ENGINEERING

By B. A. ETCHEVERRY,

Professor of Irrigation Engineering, University of California.

In three volumes—the most comprehensive work in the field. A wealth of information of both practical and informative value for everyone interested in water development and conservation. Prices are net postpaid and remittances must accompany order. Allow from one to two weeks for transmittal of order and shipment from the publishers.

Vol. 1.—Uses of Irrigation Water and Irrigation Practice.....$2.50
Vol. 2.—Conveyance of Water..... 4.00
Vol. 3.—Irrigation Structures and Distribution System..... 4.50

Address all orders to

Oakland California

Finds Overhead Irrigation Reduces Wind Damage

W. W. Read, Orange County (Cal.) rancher, who owns a citrus orchard near Olive, is a strong believer in the overhead method of sprinkling. One of the big advantages of this method of irrigation, according to Mr. Read, is the protection which it affords against hot, dry winds which peridically afflict fruit growers in many parts of the southwest.

Mr. Read has been experimenting with his overhead system as a possible preventive of scorching of trees by electricity carried in the air when desert winds are blowing. His experiments so far have not been entirely successful, but results have been such that he has been convinced of the possibility of this method of irrigation being effective in preventing wind damage to trees.

He installed the system throughout his grove last spring, following an experiment with one tree the previous year. At the time of a heavy wind, on Oct. 10, 1924, Read singled out a tree in his orchard and kept a spray of water running on it during the storm. The tree was not damaged but others in the orchard were.

Desert storms this year have damaged his trees, Read admits, but he attributes this to his failure to get sprinklers in operation in time. He failed to start his sprinklers until the wind had been blowing two days. He will continue the experiment, and before making final decision as to efficiency of the plant in preventing scorching, will await the next storm, when he will start the sprinklers at the first indication of wind and keep them in operation throughout the period of the storm.

Regardless of what benefit it may be as a preventive of damage by wind, the sprinkler system is worth all it costs and more, declares Mr. Read. He says it offers more even distribution of water and at the same time effects a 25 per cent saving in water. The system cost this grower $300 an acre for installation and it costs him 1 cent an inch per hour for operating, the water being pumped under pressure to the system from an irrigating ditch near by.

Mr. Read is emphatic in his declaration that there is no justification for the claim that overhead sprinkling will eliminate red spiders or purple scale. He does maintain, however, that the pests can be kept in check.

Asserting that new growth on his trees this year is four times greater than that of trees in adjoining orchards where the usual irrigation methods are employed, Read attributed this fact to the better aeration of the ground resulting from sprinkling.

It's Not Concrete

The illustration which appears above was used in the November issue of MODERN IRRIGATION in connection with the article by Kenneth Q. Volk, chief engineer of the Vista Irrigation District, describing construction activities of that district. Under it appeared the erroneous caption: "Laying a concrete siphon over a precipitous incline."

The construction described by Mr. Volk included extensive use of both concrete and steel for the distribution of water, and illustrations were submitted showing typical examples of both. In some way the captions for the pictures were transposed, with the result that the installation shown above, which is obviously steel, was labelled concrete, and the picture of the installation of a concrete siphon, appearing on the cover, was referred to as steel.

The steel siphons installed on the Vista Irrigation system were supplied by the Western Pipe & Steel Company of California, and special apologies are due to that company for the error.—EDITOR.

PRICE PUMPS

We specialize in Centrifugal and Deep Well Turbine Pumps for Irrigation and Industrial Uses—
Our Double Suction Split Case Type illustrated herewith are carried in stock—
High in Efficiency.
Dependable in Performance.
And Low in Upkeep Costs.
Your inquiries are solicited.

G. W. Price Pump & Engine Co.
1350 Folsom St., San Francisco

SURVEY *of* IRRIGATION DEVELOPMENT

As Shown by Official Records of the Month -- Local, State, and Governmental

OFFICIAL RECORDS FORESHADOW BIG DEVELOPMENTS

AMONG the more important permits to appropriate water issued by the Department of Public Works, Division of Water Rights of California, during the month of October, 1925, were the following:

Permit No. 2260, Application No. 4410 (San Diego County). Issued to Walsh and Betsworth, Valley Center, Calif., October 1, 1925, for 0.37 cubic foot per second and 100 acre feet per annum from Woods Valley Creek in Section 14, T 11 S, Range 2 W for domestic and irrigation of 30 acres in Section 14. Estimated cost $2,000.

Permit No. 2267, Application No. 4421 (San Luis Obispo County). Issued to Duane R. Hall, Paso Robles, Calif., October 10, 1925, for 0.55 cubic foot per second from Salinas River, in Section 4, T 27 S, R 12 E, for irrigation of 44.35 acres in Section 4. Estimated cost $1250.

Permit No. 2268, Application No. 4635 (San Joaquin County). Issued to Alfred S. and Wm. C. Ferguson, Stockton, Calif., October 10, 1925, for 12.21 cubic feet second from Old River and Western Canal in Sections 20 and 29, T 1 S, R 4 E, for irrigation of 977.1 acres near point of diversion. Estimated cost $11,000.

Permit No. 2273, Application No. 4454 (San Joaquin County). Issued to J. A. Bennett, Walnut Creek, Calif., October 14, 1925, for 1.51 cubic feet per second, from Potato Slough in Section 24, T 3 N, R 4 E, for irrigation of 121.1 acres in Section 24. Estimated cost $1000.

Permit No. 2274, Application No. 4637 (San Joaquin County). Issued to Caroline Moran, Stockton, Calif., October 14, 1925, for 12.44 cubic feet per second from Middle River in Sections 12 and 23, T 1 S, R 5 E, for irrigation of 995.5 acres near point of diversion. Estimated cost $9,000.

Permit No. 2277, Application No. 4460 (San Joaquin County). Issued to River Junction Reclamation District No. 2064, care Harmon S. Bonte, Balfour Bldg., San Francisco, Calif., October 16, 1925, for 72.29 cubic feet per second, from Stanislaus River in Section 9, T 3 S, R 7 E, for irrigation of 5783 acres in said district. Estimated cost $7,500.

Permit No. 2281, Application No. 4662 (San Joaquin County). Issued to Mrs. Susie Moran, Stockton, Calif., October 17, 1925, for 1.24 cubic feet per second, from Grant Line Canal in Section 26, T 1 S, R 4 E, for irrigation of 99.2 acres near point of diversion. Estimated cost $1500.

Permit No. 2282, Application No. 4350 (Sacramento County). Issued to N. D. Hack, Sacramento, Calif., October 19, 1925, for 1.25 cubic feet per second, from Sacramento River in Section 24, T 7 N, R 4 E, for irrigation of 100 acres near point of diversion. Estimated cost $1,000.

Permit No. 2285, Application No. 4501 (Yolo County). Issued to John Kneppel, Clarksburg, Calif., October 21, 1925, for 0.45 cubic foot per second from Sacramento River in Section 21, T 7 N, R 4 E, for irrigation of 36 acres near point of diversion. Estimated cost $2000.

Permit No. 2290, Application No. 2195 (Plumas and Sierra County). Issued to Feather River Power Company, San Francisco, Calif., October 23, 1925, for 55,000 acre feet per annum from Bucks Creek in Sections 33 and 29, T 24 N, R 7 E, for power purposes in Section 30, T 24 N, R 7 E, and Section 29, T 24 N, R 6 E. 106,949 theoretical horsepower to be developed. Estimated cost $7,700,000.

Permit No. 2291, Application No. 3889 (Plumas County). Issued to Feather River Power Company, San Francisco, Calif., October 23, 1925, for 23,000 acre feet per annum from Bucks Creek, in Section 19, T 24 N, R 7 E, for power purposes in Section 30, T 24 N, R 7 E, and Section 29, T 24 N, R 6 E, 106,949 theoretical horsepower to be developed.

Permit No. 2292, Application No. 4441 (Plumas County). Issued to Feather River Power Company, San Francisco, Calif., October 23, 1925, for 40,000 acre feet per annum from Bucks Creek in Section 19, T 24 N, R 7 E, for power purposes in Section 30 T 24 N, R 27 E, and Section 29, T 24 N, R 6 E, 106.949 theoretical horsepower to be developed.

Permit No. 2293, Application No. 4453 (Plumas County). Issued to Feather River Power Company, San Francisco, Calif., October 23, 1925, for 35 cubic feet per second and 1,000 acre feet per annum from Milk Ranch Creek and 3 unnamed tributaries in Sections 1, 12 and 15, T 24 N, R 6 and 7 E., for power purposes in Section 30, T 24 N, R 7 E, and Section 29, T 24 N, R 6 E, 12,998 theoretical horsepower to be developed.

Permit No. 2294, Application No. 4491 (Plumas County). Issued to Feather River Power Company, San Francisco, Calif., October 23, 1925, for 175 cubic feet per second, from Bucks Creek and Grizzly Creek in Sections 29 and 19, T 24 N, R 7 E, Section 1, T 23 N, R 6 E, for power purposes in Section 30, T 24 N, 7 E, and Section 29, T 24 N, R 6 E, 62,759 theoretical horsepower to be developed.

Permit No. 2295, Application No. 4598 (Plumas County). Issued to Feather River Power Company, San Francisco, California, October 23, 1925, for 105 cubic feet per second from Grizzly Creek in Section 1, T 23 N, R 6 E, for power purposes in Section 29, T 24 N, R 6 E. 29,627 theoretical horsepower to be developed.

Permit No. 2296, Application No. 4599 (Plumas County). Issued to Feather River Power Company, San Francisco, Calif., October 23, 1925, for 40 cubic feet per second from Milk Ranch Creek and 3 unnamed tributaries in Sections 1 and 12, T 24 N, R 6 E, for power purposes in Section 30, T 24 N, R 7 E, and Section 29, T 24 N, R 6 E. 14,854 theoretical horsepower to be developed.

Permit No. 2298, Application No. 438 (San Bernardino County). Issued to Mojave River Irrigation District, Victorville, Calif., October 28, 1925, for 30,000 acre feet per annum from Deep Creek and West Fork Mojave River in Sections 17 and 18, T 3 N, R 3 W, for irrigation of 26,878.36 acres in said district. Estimated cost $1,700,000.

Applications Filed

Among the applications for permit to appropriate water filed with the State Department of Public Works, Division of Water Rights, (California) during the month of October were the following:

Application No. 4792 (Placer County). Lake Tahoe Company, care H. A. Kluegel, Balfour Building, San Francisco, Calif., for 12.5 cubic feet per second, 200 ac. ft. per annum from Ward Creek tributary to Lake Tahoe. To be diverted in Section 23, T 15 N, R 16 E, M.D.M. For generation of hydro-electric energy and domestic purposes.

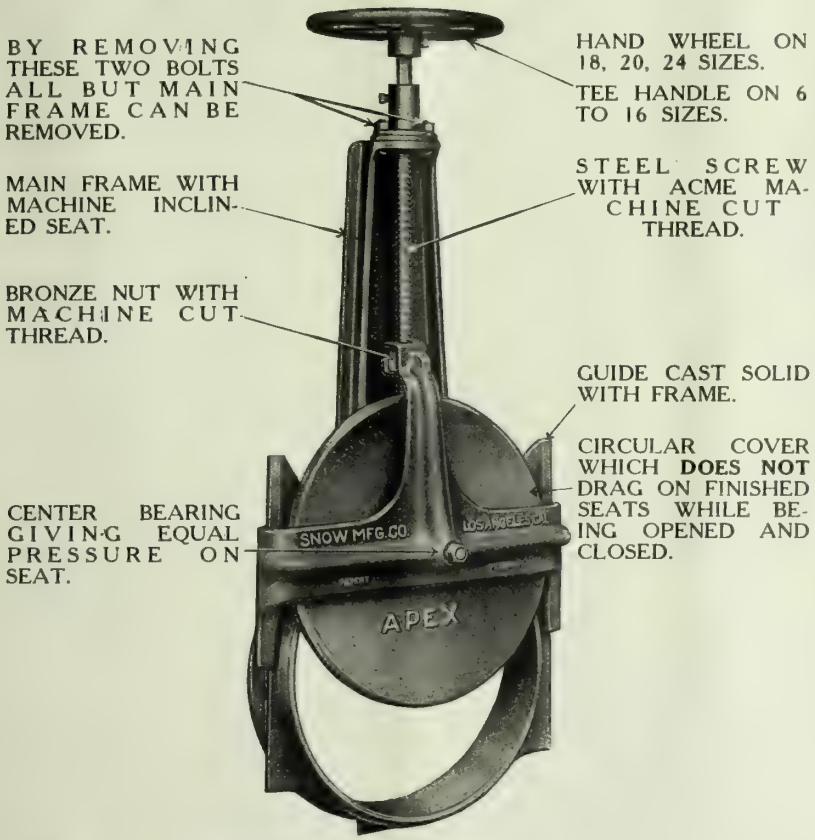
Application No. 4797 (Imperial County). Webster N. Kenyon, P. O. Box 22, Westmorland, Calif., for 1.87 cubic feet per second from underground water tributary to San Felipe Creek Watershed, to be diverted Tract 49, T 13 S, R 9 E, S. B. M. for irrigation on 160 acres in Tract 53, T 13 S, R 10 E, S.B.M.

Application No. 4799 (Placer County). Victor T. Mathews, Cisco, Calif., (1) 200 cubic feet per second, (2), (3), (4) and (5) 200,000 acre feet per annum from North Fork American River and Tributaries, Big Valley and Granite Creeks tributary to Sacramento River, to be diverted in (1) Section 2, T 15 N, R 11 E, M.D.M., (2) Section 30, T 16 N, R 13 E, M.D.M., (3) Section 19, T 16 N, R 13 E, M.D.M. (4) Section 15, T 16 N, R 13 E, M.D.M., and (5) Section 30, T 14 N, R 17 E, M.D.M. for irrigation of 30,000 acres in T 11, 12, 13 N, and R 4, 5 and 6 E, M.D.M.

Application No. 4800 (Siskiyou County). Thos. M. Park, care H. H. McPike, 332 Pine Street, San Francisco, Calif., for 3,000 cubic feet per second from Klamath River to be diverted in Section 10, T 46 N, R 12 W, M.D.M. for generation of hydro-electric energy in Section 18, T 46 N, R 12 W, M.D.M. 54,545 T.H.P. to be developed. Estimated cost $6,000,000.

Application No. 4801 (Siskiyou County) Thos. M. Park, care of H. H. McPike, 332 Pine street, San Francisco, Calif., for 3,000 cubic feet per second from Klamath River, to be diverted in Section 5, T 16 N, R 8 E, H. M. For generation of hydro-electric energy in Section 6, T 11 N, R 8 E, H. M.,

·SNOW·
IRRIGATION APPLIANCES



BY REMOVING THESE TWO BOLTS ALL BUT MAIN FRAME CAN BE REMOVED.
MAIN FRAME WITH MACHINE INCLINED SEAT.
BRONZE NUT WITH MACHINE CUT THREAD.
CENTER BEARING GIVING EQUAL PRESSURE ON SEAT.
HAND WHEEL ON 18, 20, 24 SIZES.
TEE HANDLE ON 6 TO 16 SIZES.
STEEL SCREW WITH ACME MACHINE CUT THREAD.
GUIDE CAST SOLID WITH FRAME.
CIRCULAR COVER WHICH DOES NOT DRAG ON FINISHED SEATS WHILE BEING OPENED AND CLOSED.
SNOW MFG.CO.
LOS ANGELES CAL.
APEX

SNOW APEX WEDGE SEAT GATES are constructed to work equally well and hold tight under considerable and varying water pressures, regardless of the direction of the flow.

The gate is opened and closed by a non-rising machine cut screw working through a bronze nut, the pressure bearing evenly on the center of a sliding lid which closes over a wedge shaped seat. The face of the lid and seat being closely ground, give an absolutely water tight joint without the use of packing or gaskets.

For ordinary purposes an iron to iron seat is found satisfactory, but where water conditions are bad, the brass seat is preferable and can be furnished.

Made in sizes six-inch to twenty-four-inch diameter openings.

CONCRETE MACHINERY & SUPPLY COMPANY

EXCLUSIVE DISTRIBUTOR

2014 Santa Fe Avenue -:- Los Angeles, Calif.

For Detailed Listings, Telephone Numbers, Etc., See the Buyers' First Aid—Page 124

T. H. P. to be developed 34,091. Estimated cost $4,000,000.

Application No. 4805 (Placer County) Victor T. Mathews, Cisco, Calif., for 200 cubic feet per second and 200,000 acre feet per annum from North Fork of American River and tributaries, tributary to Sacramento River, to be diverted in Sections 30, 19 and 15, T 16 N, R 13 E, M. D. M. and Section 30, T 14 N, R 17 E, M. D. M., for generation of hydro-electric energy in Section 2, T 15 N, R 11 E, M. D. M., 18,182 T. H. P. to be developed. Estimated cost $3,000,000.

Application No. 4807 (San Bernardino County) Water Conservation Association, Riverside, Calif., for 250,000 acre feet per annum from Santa Ana River and (or) tributaries, tributary to Pacific Ocean to be diverted in Sections 9, 10, 11 and 12 T 1 S, R 3 W, S. B. M., Sections 4, 7, 8 and 9, T 1 S, R 2 W, S. B. M., Sections 13, 22, 23, 24, 25, 26, 27, 34, T 1 N, R 2 W, S. B. M. and Sections 8, 17 and 18, T 2 N, R 1 W, S. B. M., for agricultural purposes on 52,640 acres.

Application Number 4811 (Sacramento County) Fair Oaks Irrigation District, Fair Oaks, Sacramento County, Calif., for 7 cubic feet per second from American River tributary to Sacramento River to be diverted in Section 18, T 9 N, R 7 E, M. D. M., for irrigation of 3800 acres. Estimated cost $30,000.

Application No. 4812 (Mariposa County) James I. East, care of Ohm and Raab, 517 E. Market street, Stockton, Calif., for 3 cubic feet per second and 500 acre feet per annum from Mariposa Creek tributary to San Joaquin River, to be diverted in Section 1, T 8 S, R 16 E, M. D. M., for agricultural purposes on 350 acres in Section 1 and 2, T 8 S, R 16 E, M. D. M.

Application No. 4817 (Placer County) Fred Dewhirst, care of F. Emerson Hoar Co., 955 Market street, San Francisco, Calif., for 300 cubic feet per second and 100,000 acre feet per annum from Bear River tributary to Feather River to be diverted in Section 2, T 13 N, R 8 E, M. D. M. For agricultural and domestic purposes on 60,000 acres.

Application Number 4818 (Placer County) Edward F. Walker, Glendale, Calif., for 15 cubic feet per second and 200 acre feet per annum from Ward Creek tributary to Lake Tahoe to be diverted in Section 22, T 15 N, R 16 E, M. D. M., for power purposes, 852 T. H. P. to be developed.

Application No. 4820 (San Joaquin County) Walter A. Perry, Stockton, Calif., 2.53 cubic feet per second from Old River tributary to San Joaquin River, to be diverted in Section 29, T 1 S, R 6 E, M. D. M., for irrigation purposes on 203 acres. Estimated cost $4000.

OREGON

The following list includes the more important applications as filed in the office of Rhea Luper, State Engineer of Oregon, for the last month for which records are available:

Calvin Puderbaugh of Fruita, covering the appropriation of water from Mahogany Creek for irrigation of 20 acres, and domestic purposes in Wallowa County.

H. W. Vogel of Oretown, covering the appropriation of water from Commons Creek for development of power in Tillamook County.

George E. Frost of Portland, covering the appropriation of water from Spruce Spring for domestic purposes in Lincoln County, at a cost of $2,200.

Shoemaker Brothers of Mitchell, covering the appropriation of water from Mill Creek for supplemental irrigation of 139.67 acres in Wheeler County.

L. A. Whitley of Trail, covering the appropriation of water from Elk Creek for irrigation of 13 acres in Jackson County.

Duhaime Brothers of Burns, covering the appropriation of water from Poison Slough and Foley Slough for irrigation of 160 acres in Harney County.

George D. Williams of Ashland, covering the appropriation of water from Jenny Creek for irrigation of 59.7 acres in Jackson County, at a cost of $500.

T. J. Duhaime of Burns, covering the appropriation of water from Poison and Foley Sloughs for irrigation of 160 acres in Harney County.

Frank Obenchain of Bly, covering the appropriation of water from Merrill Creek for irrigation of 74.4 acres in Klamath County.

Jettie Bolos of Chico, California, covering the appropriation of water from Kelly Creek for irrigation of 27 acres in Josephine County, Oregon.

Henry L. Corbett of Portland, covering the appropriation of water from Jack Creek for development of 20.9 theoretical horsepower in Jefferson County, at a cost of $1,000.

M. J. Lee, Trustee, of Canby, covering the appropriation of water from Molalla River for irrigation and power purposes in Clackamas County.

C. T. Darley of Klamath Falls, covering the appropriation of water from Pearl Spring for irrigation of 160 acres and domestic purposes in Klamath County.

Edward E. Heslin of Fairview, covering the appropriation of water from an unnamed stream for irrigation of 19.72 acres in Multnomah County.

George A. and Violet C. Fuller of Perry, covering the appropriation of water from Gordon Creek for irrigation of 80 acres in Union County.

City of Wallowa, covering the appropriation of waste and seepage water from C. W. Moore Ranch for supplemental irrigation of 132 acres in Wallowa County.

George R. McKimens of Mohler, covering the appropriation of water from South Fork of Kebbe Creek for domestic and irrigation purposes in Tillamook County.

Mac-A-Wauna Company of Mosier, covering the appropriation of water from Mosier Creek for irrigation of 16.4 acres in Wasco County, at a cost of approximately $4,000.

City of Baker, covering the appropriation of water from Pine Creek and South Prong of Pine Creek for storage of 1380 acre feet in Pine Creek Reservoir; and the appropriation of water from Pine Creek and its tributaries, together with the stored water for municipal purposes, at a cost of $60,000.

Frank Waldon of Prairie City, covering the appropriation of water from John Day River for irrigation of 25 acres in Grant County.

R. W. Cary of Portland, covering the appropriation of water from Bagsby Hot Springs, and Hot Springs Fork, including Nohorn and Whetstone Creeks for development of power and summer resort purposes.

A. C. Gienger of Chiloquin, covering the appropriation of water from Williamson River and Spring Creek for domestic purposes in Klamath County, at a cost of $10,000.

Joseph R. Keep of Portland, covering the appropriation of water from White River, and from Frog Lake Creek, Clear Creek, and water stored in reservoirs for power, irrigation and domestic purposes in Hood River and Wasco Counties respectively.

Fred Haines of Burns, covering the appropriation of water from Poison Slough for irrigation of 160 acres in Harney County.

Fred Train of Copco, California, covering the appropriation of water from Spring and Falls Creek for domestic and irrigation of 80 acres in Jackson County.

Power Developments

Twenty-four applications for permit or license under the Federal water power act were filed with the Federal Power Commission during the ten weeks period ended November 7, 1925. The following are the applications affecting power developments in the west:

No. 646. The Red River Lumber Company has applied for a preliminary permit for a power development in Hat Creek, within the Lassen National Forest, in Shasta County, California. The company plans to construct a dam of sufficient height to divert 200 second feet of water from the creek through a flume to a power house which, with other appurtenant structures, will be built about 3.4 miles from the dam site. The developed power will be used for manufacturing purposes.

No. 647. The City of Los Angeles has made application for a preliminary permit covering an extensive proposed development on the Colorado River, in San Bernardino County, California, and Yuma and Mohave Counties, Arizona, comprising a reservoir, dams, waterways, and power plants, designed to develop 108,000 horsepower of electric energy. It is proposed that construction work be carried on in conjunction with any plans which the Bureau of Reclamation may adopt for irrigating and reclaiming lands adjacent to the Colorado River. The City proposes to operate this project in conjunction with a project at Boulder Canyon for which application is now pending before the Commission. The developed power would be used for public-utility purposes. Action on this application has been suspended under the Commission's order of October 28, 1925, relating to all projects affecting the Colorado River.

No. 648. Messrs. Jas. B. Knight, Fred M. Kay, J. L. Stone, W. H. Haw, Frank Breeden, and David Wilson, have applied for a preliminary permit for a power development in New River, in Trinity County, California. A 50-ft. dam, having a crest of 250 ft. in length would divert water from the river through a conduit about 12 miles in length to a power house to be built near the mouth of the river and to have an installed capacity of 5,000 horsepower. The developed power would be used in lumbering and mining operations.

No. 652. The Southern Sierras Power Co. has applied for a license for a 110-kilowatt transmission line about a mile and a half in length in the Inyo National Forest, Mono County, California, to connect a switch structure on the Owens River Gorge with the company's main transmission system.

No. 653. The Liberty Montana Mines Co. has applied for a license covering a power project in South Boulder Creek in Madison County, Montana, proposing to develop 300 horsepower for use in mining operations. The installation would include a 15-foot

dam creating a small reservoir, a conduit about 4-5 mile in length, a power house, and a transmission line leading to the company's mill.

No. 660. Mr. Fred T. Colter, claiming to act on behalf of the State of Arizona, has applied for a preliminary permit for power and irrigation development on Colorado River, in Coconino and Mohave Counties, Arizona. A storage dam, to impound approximately 52,000,000 acre-feet of water, is proposed at Glen Canyon dam site. A power, storage, and diversion dam is proposed at Bridge Canyon dam site, to be used to supply water for irrigation by gravity. Action on this application is suspended under the Commission's order of October 28, 1925, relating to all Colorado River cases.

No. 661. The Board of Directors of State Institutions of the State of Arizona has applied for a preliminary permit for a development in Mohave County, Arizona, at Bridge Canyon dam site, in the Colorado River. It is said that the State proposes to construct a dam which can be raised to an approximate height of 1,000 feet, for the purpose of impounding water for irrigation, and for reducing flood danger. The power developed would be utilized for irrigation pumping. Action on this application is suspended under the Commission's order of October 28, 1925, relating to all projects affecting the Colorado River.

No. 662. The Best Flume & Power Company has applied for a license for a development on Pine Creek, in Sublette County, Wyoming, to be used in supplying the town of Pinedale, Wyo., with power.

No. 665. The Utah Power & Light Company has applied for a license for a constructed project in Utah County, Utah, on Santaquin Creek. The developed power is used for public utility purposes.

No. 666. Mr. Thomas M. Park has applied for a preliminary permit for a power development in Siskiyou County, California, five miles east of Happy Camp. Three thousand second feet of water would be diverted from Klamath River without use of dam or obstruction, for the generation of power for the operation of mining camps, and would be returned to the river farther downstream.

No. 668. The Southern California Edison Company has applied for a preliminary permit for a power development project in Colorado River, near Topock, Arizona, proposing to build a concrete dam in Mohave Canyon approximately 168 ft. in height, at which power would be developed for use in public-utility purposes.

Addison Smith on Reclamation

(*Continued from Page 15*)

ly five hundred thousand people are now living on these lands. Many of them have acquired competency, and they purchase annually more than $500,000,000 worth of manufactured goods, mostly from other states.

Some projects were undertaken which were unfeasible from an engineering standpoint, which made the cost excessive. Others were in localities where soil and climatic conditions were not favorable. But for these mistakes, we would not now be confronted with the failures that have embarrassed those advocating the federal reclamation policy.

Yet on many of the projects this year the gross value of average production per acre will exceed $100. On some projects, specializing in the growing of fruit and potatoes, the gross value of the crop per acre will exceed $1000.

We have assurance that the failures of the past will not be repeated. Under the law based on the Fact Finders' report, a careful selection of settlers is required, based on their experience and their financial ability to equip an irrigated farm unit. It is also required that no project shall be undertaken until a careful survey has been made by the Department of Agriculture with reference to the character of the soil.

INCREASE in population is not the only factor that demands consideration from the people of America and emphasizes the need for serious thought on the matter of going further than we have yet gone, and extending land reclamation.

The shrinkage and abandonment of approximately 1,000,000 acres of eastern crop lands annually is one of these factors.

The fact that we produce only about one-fifth of the sugar consumed by our vast and increasing population should still further convince us of the wisdom of opening up to settlement greater areas of western arid lands admirably adapted to the cultivation of the sugar beet.

There should go hand in hand with the extension of reclamation the wider application of co-operative marketing. By this combination we should have the wisest undertaking that has ever been devised in the interest of farming and allied industries.

Reduction of cost of production, standardization of commodities, orderly distribution, properly regulated plantings and other methods of efficient co-operative marketing management are but a few of the profit sharing benefits that would accrue.

It is an established fact that land reclamation and co-operative marketing are rather closely allied. The expansion of one automatically extends the usefulness and service of the other.

In their messages and public utterances on the subject the President and the Secretary of Agriculture have shown themselves to be earnest champions of the benefits to be derived by the farmer through co-operative organization. The present Division of Co-operation, in the Department of Agriculture, has been and is rendering invaluable service to co-operatives and to farmers contemplating such organizations.

The expansion and enlargement of this division, now in charge of such well-known experts as Lloyd S. Tenny, C. L. Christenson, and A. W. McKay, will probably be effected during the present session of Congress.

KIMBALL
DIRECT FLOW TURBINE
PUMPS

For any well from 7 inches up. Gives 400% more clearance than centrifugal pumps. In replacing pit pumps the Kimball can be hung over present pit.

Editorial Jottings About Current and Forthcoming Feature Articles, Dealing With Practical Problems of Hydraulics, and the Men Who Have Written Them

EXPERIENCE in many different parts of the world, and contact with the irrigation activities of all continents, have given THOMAS H. MEANS a perspective which he utilizes to good advantage in his article in this issue on "Irrigation in the Four Quarters of the Earth."

France, Algiers, Tunis and many parts of Egypt were visited by Mr. Means early in his engineering experience. He spent nine years in the United States Department of Agriculture, in the establishment of soil surveys, the investigation of irrigation and drainage lands, and making reports on the agricultural possibilities of special regions. It was during this service for the Department that he went to Europe and northern Africa and made a study of land reclamation as practiced there.

Six years were invested in the U. S. Reclamation service, part of which time Mr. Means spent in the general examination of all projects. He was later in charge of operation on the first reclamation project that delivered water—the Truckee-Carson project.

For the latter half of his thirty years of professional experience, Mr. Means has been in San Francisco in private practice. During this period he has become well known for his engineering judgment in constructing and advising capacities. He has built a number of public and private irrigation projects, and at the present time his work consists largely of investigations and construction work for irrigation and reclamation districts.

EVERETT N. BRYAN, chief deputy in the office of Edward Hyatt, Jr., chief of the Division of Water Rights of the California Bureau of Public Works, this month contributes the first of a series of articles that will come from California irrigation officials discussing aspects of state control and development of water. Mr. Bryan writes on "The Importance of the Orderly Establishment of Water Titles." Other experts in the office of the Division of Water Rights are to contribute future articles dealing with various important and interesting phases of the work of the California state office in aiding and directing water use.

Mr. Bryan was brought up in California, and was graduated from the University of California in 1907. Since 1909 he has been engaged continuously in irrigation and hydroelectric work. Positions which he has held in the irrigation industry include: assistant engineer, Turlock irrigation district; superintendent, Modesto irrigation district; chief engineer for T. K. Beard, constructor of highways, reservoirs and irrigation systems; chief engineer, Waterford irrigation district. He has also spent considerable time in private practice, doing valuation work and making water supply and irrigation studies. He entered the office of the California Division of Water Rights as hydraulic engineer, was subsequently made office engineer, and is now Deputy Chief of the Division.

ADDISON T. SMITH is a representative in Congress from Idaho, his home being at Twin Falls in that state. He was born in Ohio, and educated in Washington, D. C., where he took his law degrees and was admitted to the bar. He served in the senate as a committee clerk for several years, removed to Idaho in 1900, was admitted to the bar there, and returned to Washington as secretary to Senator Shoup of Idaho and his successor, Senator Heyburn. In 1906 he was appointed by President Roosevelt as register of the land office at Boise, Idaho, and

EVERETT N. BRYAN

in 1913 was chosen a member of Congress, serving in every Congress from the 63rd to the 69th, which is now in session. His interest in irrigation and reclamation was aroused by his early contacts with the land and water problems of the west, and after he returned as a law-maker to the scenes which were so familiar to him as a young man, he exerted his efforts in the direction of wise irrigation legislation. He is co-author with Senator McNary of the co-operative reclamation measure introduced before the last congress, and known as the Smith-McNary bill. Since 1923, he has been chairman of the house committee on irrigation and reclamation.

IRVING C. HARRIS is a Los Angeles consulting engineer, associated with William S. Cone in the partnership of Cone & Harris. He was graduated in electrical engineering, in 1900, from what is now the California Institute of Technology. For five years Mr. Harris was Engineer in Charge of the power division of the Salt River Project of the Reclamation Service, during which time he had charge of the construction and operation of the power plant at the Roosevelt Dam and other power plants, sub-stations, transmission lines and pumping plants on the projects. Leaving the Salt River Project in 1904, he spent nearly three years traveling in the East on a special assignment for the Service, as Engineer in Charge of Inspection. This work involved the inspection of water and power structures manufactured for use by the service. His present work includes examination, reporting, designing and supervision of power development and irrigation works.

CARLETON M. JOY, who has written the brief account of the visit of the senate committee on irrigation and reclamation on the Lower Colorado River, is connected with the Imperial Irrigation District. Thomas Brooks is in charge of domestic service and supply for the Los Angeles Bureau of Water Works and Supply. Charles P. Williams is a consulting engineer who is well acquainted with the conditions and problems of the Lower Rio Grande Valley. George C. Jewett is president of the Federal Farm Loan Bank at Spokane, Washington. Hugh Crane is a staff contributor whose name is regularly seen in these columns.

THE JANUARY issue will be full of interesting articles dealing in a practical way with hydraulic developments in many parts of the west. While it is not a sectional journal, MODERN IRRIGATION'S interest in the allied water development industries makes it primarily a publication of the western half of the United States. It is fast coming to have a wide acceptance over all of this great territory, and the character of the contents of the January number will testify as to the variety of its editorial interest from the standpoint of geography.

Idaho, Nebraska, Texas, Oregon, and California will be represented by articles in the first number in 1926. The Idaho article will deal with developments at American Falls; and the Texas feature will describe what is being done by the Hidalgo County Water Improvement District No. 4, on the lower Rio Grande. This feature will be especially interesting in view of the discussion appearing in this issue in which Mr. Williams describes the peculiar problems of drainage which confront water companies on the Lower Rio Grande Valley.

B. J. Seger, of Scottsbluff, Nebraska, whose article in this issue introduces the subject of credit for irrigation districts, will conclude the series in the January number. Another article will deal with developments in the Imperial Valley of California, and a feature prepared by Arthur P. Davis, internationally known engineer, will describe the work undertaken by the East Bay Municipal Utility District on the great Mokelumne River project. Oregon will be represented by a discussion of "Irrigation and Power," by Franklin J. Griffith, of Portland.

An Organized Voice for the Forces of Agriculture and Industry Which are Primarily Dependent Upon Irrigation

A ROMANCE of SALVAGED SOIL

THE soil in the Las Pomas Valley of California has ever been rich in possibilities, but very poor in the one element necessary to make it productive—WATER.

Ample irrigation—the one lacking essential for a profitable golden harvest, has long been the dream of the growers of this region.

And now, through a highly developed irrigation system, their dream has come true. Six deep wells have been successfully sunk and, by the application of Westinghouse motor-driven turbine pumps, enough water is available to irrigate 4300 acres of this dormant soil and convert it into a veritable oasis of fertility and productivity.

How this irrigation project was developed and a potential soil salvaged for profitable growing will be told in a number of subsequent issues of Modern Irrigation. It is truly "a romance of salvaged soil."

The cornerstone *of* California's three and a half billion *of* farm wealth

The development of water is making California truly an empire within itself. A census of the Golden State's agricultural wealth shows that today it is in excess of three and a half billions of dollars and still countless acres await development and settlers.

Fifty years ago the Byron Jackson Pump Manufacturing Company pioneered this irrigation development. The pumps of this company now dot California's fields from the Sierra to the sea.

Only a product honestly and efficiently made and backed by modern field service could maintain this leadership in the face of world competition.

Fairbanks-Morse Diesel driving a 24-inch F-M centrifugal pump on Ben Sheffield Ranch near Miles City, Montana. Below, F-M vertical motor direct-connected to turbine pump, with F-M motors driving F-M centrifugals in the background, Fillmore, Calif.

Water at what cost?

Getting an adequate supply of water is only part of the problem. The supply must be obtained at a cost that will not dwarf your profits.

Pumping experts of long experience, Fairbanks-Morse engineers have analyzed hundreds of pump applications from the cost standpoint, and have installed hundreds of profit - making systems.

Fairbanks-Morse sturdy, rugged, ball bearing motors direct-connected to F-M Centrifugal Pumps are giving notably efficient operation. In many localities, Fairbanks-Morse Diesel Engines, burning low grade oils at a remarkable saving, have proved the ideal power unit for irrigation systems. For driving deep well pumps, F-M Vertical Motors have an established record.

Whatever type of layout you need to give a low-cost water supply, Fairbanks-Morse is prepared to furnish it.

One of our engineers will show you how we "make the layout justify the outlay."

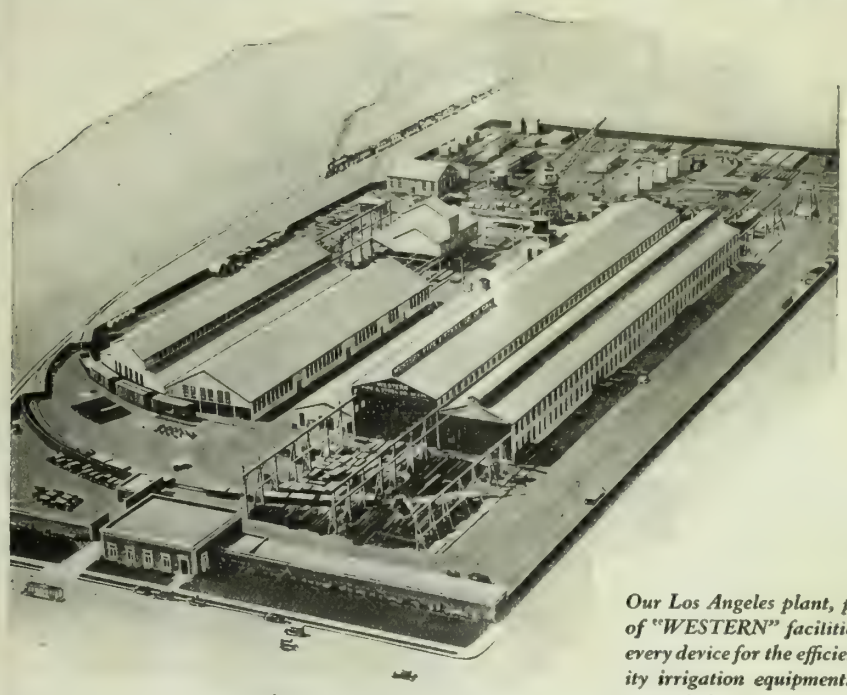
IN THE WEST • IT'S "WESTERN"



As the largest company of its kind in the Western United States, we have been identified with the manufacture of irrigation equipment for hundreds of installations, including a majority of the major projects of the West. A recent "WESTERN" installation, rapidly nearing completion, is that for the Puente Irrigation District, California. Handled complete, including ditching and laying of pipe.

Our Los Angeles plant, pictured here, is typical of "WESTERN" facilities. It is equipped with every device for the efficient manufacture of quality irrigation equipment. Prompt delivery is assured. Your inspection is invited.

IRRIGATION EQUIPMENT SPECIALISTS

Ever since the founding of this company, a large portion of our effort has been devoted to the manufacture of quality irrigation equipment, such as well casing, water pipe, etc. Naturally, we have gained much valuable experience in that time and pass this on to the user of "WESTERN" Equipment in the form of products which satisfactorily meet every demand of the irrigator. Regardless of whether you plan an immediate installation or not, and without obligation of any kind, we would be glad to have you bring your irrigation problems to us for solution.

New Era of Water Development is Predicted

M. E. Layne Gives Reasons for Active Western Irrigation Development. Bonus for Employees Distributed

THAT 1925 has shown greater progress in the development of well irrigation than in any previous year, excepting the peak war period and that 1926 is destined to eclipse 1925 both in volume of orders and introducing of pump improvements, is the assertion of M. E. Layne, President of Layne & Bowler Corporation of Los Angeles, manufacturers of Layne & Bowler Turbine Pumps.

It is his opinion that irrigators —recognizing the fact that they are liable to have a water shortage—will no longer delay the installation of additional plants and that the irrigation season will this year begin at least eight weeks before the normal commencement time.

When asked to state the fundamental reasons for the particularly impressive growth of his organization during the past year, Mr. Layne stated:

"The general impression is that our growth is wonderful. But this growth is easily understood when you consider the fact that all of our earnings have remained in the business, and out of the forty-two years of continuous growth of this business only three dividends have ever been declared. These three dividends were paid at the close of and following the war (1918, 9 per cent; 1919, 9½ percent; 1920, 10 percent), while during the slump period (1921-2-3) the factory was operated without profit—due mainly to the depreciation in value of material on hand, and inability to rapidly reduce and adjust the high salary overhead built up by the war demands. (The war price of common and skilled labor has not been reduced, but has slightly increased).

"Our overhead has been greatly reduced for the period of 1924 and 1925 by reason of increased volume of business—making it possible for us to sell our highly refined product at a greatly reduced price, and the further fact that we have not paid any dividends since 1920 has put us in a position to discount our bills,purchase our materials in larger quantities, give liberal terms to our customers, and to sell and install our plants at the lowest possible price.

"The net earning of our company for 1925 was approximately 9 per cent. The stockholders of the corporation are sharing this earning with their employees in the following way:—All employees drawing less than $200 per month have received a bonus of 6 per cent on their total 1925 salary; all employees earning from $200 up to and including $300 per month have received 5 per cent on their 1925 salary; and all employees earning over $300 per month have received a 4 per cent bonus on their 1925 salary. This leaves to the stockholders an earning on their investment of a smaller percentage than if they had placed their capital in real estate loans or other securities.

"The above bonus is given in order, first: to be fair to our employees; second, to retain them in the business, realizing that the corporation's growth and the customer's profits depended on long life and high efficiency of our product—which is only made possible through the efforts of skilled and experienced man-power.

"During our forty-two years of progressive operation we have never had a strike among our employees. This is conclusive evidence that they appreciate their relationship with us.

"Our corporation also protects each member of the entire force, regardless of age, with $8000.00 worth of individual insurance. Should their death be caused by accident, while on duty, the relatives of the deceased will receive $5000 covered by accident insurance, plus $3000 covered by straight life insurance. Should death occur from causes other than accident the relatives of the deceased will receive $3000. Each of our employees is protected by accident compensation insurance, all premiums being paid by the company without cost to the employee."

Mr. Layne was asked, what, in his belief, was the cause of his firm's reduction in overhead and if it was as low or lower than that of competing companies. He replied: "When considering our large volume of business, the percentage of overhead costs is less than one-half of the costs that prevailed during our developing and wartime period, which strikingly reflects the economy of quantity production. Our overhead is far below that of competing companies which are not favored with equal volume of business we are enjoying."

BOARD *Of* ADVISORS

EDITORIAL COUNSELLORS TO MODERN IRRIGATION

Representing Agriculture

CHAS. C. TEAGUE,

President California Fruit Growers' Exchange; President, California Walnut Growers' Association.

A. C. HARDISON,

President, California Farm Bureau Federation, and member of the Executive Committee, American Farm Bureau Assn.

J. V. MENDENHALL,

President, California Delta Farms, Inc.; President, Holland Land Co.; President, California Approved Land Settlement Assn.; President, California Delta Potato Growers' Assn., and formerly president, California Bean Growers' Assn.

Representing Engineering

ARTHUR P. DAVIS.

Chief Engineer and General Manager, East Bay Municipal Utilities District; formerly President, American Society of Civil Engineers; for many years Director and Chief Engineer, U. S. Bureau of Reclamation; co-author of "Irrigation Engineering."

LOUIS C. HILL.

Of Quinton, Code & Hill, Consulting Engineers; formerly Supervising Engineer, U. S. Bureau of Reclamation, and authority upon all phases of hydraulics.

CARL E. GRUNSKY,

President, American Engineering Corporation; formerly President, American Society of Civil Engineers; President, Pacific Division of American Assn. for the Advancement of Science.

W. F. McCLURE,

California State Engineer and Director of the California Bureau of Public Works.

EDWARD HYATT, JR.,

Chief, Division of Water Rights, California Bureau of Public Works.

A. L. SONDEREGGER

Consulting Hydraulic Engineer and a recognized authority on ground water problems.

R. V. MEIKLE,

Chief Engineer, Turlock Irrigation District; Chief Engineer, Merced Irrigation District, and of the Don Pedro project, Modesto Irrigation District.

Representing Irrigationists

WILLIAM DURBROW

President, Irrigation Districts Ass'n. of California; General Manager and formerly president, Glenn-Colusa Irrigation District.

GLENN D. SMITH,

President, California Mutual Water Companies Assn.

GEORGE L. SWENDSEN,

General Manager, Fresno Irrigation District.

Representing Land Settlement

J. V. MENDENHALL,

President, California Approved Land Settlement Assn.; President, California Delta Farms, Inc.; President, Holland Land Company.

GEORGE E. SPRINGER,

Vice-President, California Approved Land Settlement Assn.; Sec. and Gen. Manager, Alameda Farms Co., Alameda Sugar Co., and Union Commercial Co.

Representing Irrig. and Rec. Law

ALBERT E. CHANDLER

Of Haven, Athern, Chandler & Farmer; formerly President, California State Water Commission; Counsel for various irrigation projects; author of "Elements of Irrigation Law."

DAN HADSELL

Of Hadsell, Sweet & Ingalls; Counsel for many irrigation enterprises; authority on reclamation law.

Repr'g Investigations and Research

FRANK ADAMS

Professor of Irrigation Investigations and Practice, College of Agriculture, University of California.

B. A. ETCHEVERRY

Professor of Irrigation Engineering, University of California; author of several standard works on irrigation.

SAMUEL FORTIER

Senior Irrigation Engineer, Division of Agricultural Engineering, U. S. Dept. of Agriculture; Consulting Irrigation Engineer, University of California; formerly Irrigation Advisor to the Province of British Columbia; author of books and numerous publications on irrigation practice.

Representing Conservation

GEORGE C. PARDEE,

President, East Bay Municipal Utility District; formerly Governor of California and widely known for his activities on behalf of conservation measures.

FRANCIS CUTTLE,

President, Riverside Water Co.; President, Water Conservation Association; well known advocate of conservation measures and an authority on re-forestation.

PAUL G. REDINGTON,

District Forester, U. S. Forest Service, and Western Representative, Federal Power Commission.

M. B. PRATT,

California State Forester; an active worker for conservation in its application to irrigation and agriculture.

Representing Constructionists

ARTHUR S. BENT,

President, Bent Bros., general contractors, specializing in dam construction; formerly president Associated General Contractors of America; president Los Angeles Chamber of Commerce and director United States Chamber of Commerce.

C. C. THOMAS,

Vice-President and Western Representative, Dwight P. Robinson & Co.

MELVILLE DOZIER,

Manager, Construction Industries Joint Committee; formerly State Flood Control Engineer of California.

Representing Equipment

C. F. ZIMANSKY,

President, Western Irrigation Equipment Assn.

C. A. UTLEY,

Secretary, and formerly President, Western Irrigation Equipment Assn.

K. E. VAN KURAN,

District Manager, Westinghouse Electric & Mfg. Co.

WM. ANGUS,

President and Gen. Manager, Western Machinery Co.

S. F. FORBES,

Pacific Coast Manager, Fairbanks, Morse & Co.

N. B.—The Board, as here given, is subject to future enlargements in order to insure representation for every important branch of hydraulics, and in order that all sections may be represented according to the status of hydraulic development in such geographical divisions. Membership does not imply that each member is in accord with the divers views or policies of every other member; nor does it imply, necessarily, a unanimity of opinion upon every issue treated editorially in the magazine; but all such issues are clearly defined, and a definite policy evolved by group action, before the editorial attitude of the publication is expressed upon any major question, local or national, political or otherwise, affecting the conservation or the utilization of water.

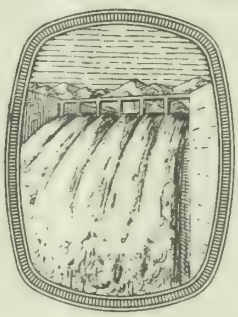
PETROLEUM WORLD 626 S. SPRING ST., LOS ANGELES, CALIF. MODERN IRRIGATION

GEORGE C. PARDEE

President of the East Bay Municipal Utility District, whose great project for increasing the water supply of the nine municipalities which it serves is described in this issue. Many men attain eminence in their chosen profession; Dr. Pardee is the unusual man who has established an enviable reputation in many fields of endeavor. He was a prominent surgical specialist before he was called to public service. As a leader in public life he became Governor of California. Today he is matching his record of success in these two lines with a career of achievement as a business executive.

MODERN Irrigation

The Magazine of Applied Hydraulics



Volume II JANUARY, 1926 Number 1

The Progress *of* Irrigation

POTENTIALLY the most significant action taken in irrigation on the American continent during December was the passage, by the Congress of the Republic of Mexico, of the Irrigation Bill. This bill was approved by the Chamber of Deputies on December 10th, and enacted unanimously by the Senate on December 24th.

The law declares that irrigation is a public utility, and creates a federal commission for carrying out extensive irrigation developments in all parts of the nation. In such a provision there lurk innumerable dangers. Applied to conditions in the United States it would be farcical, for in this country irrigation under local management moves forward two steps while the federal administration of water development is accomplishing one with considerable difficulty.

But it is possible that such a system may mean the advent of a lively period of irrigation progress in the Mexican republic. President Calles, for all his apparent phobia against foreigners, is evidently sincerely interested in the welfare of the agricultural classes, and cognizant of the need for appropriating foreign skill and experience. Mexico has a number of excellent agricultural schools in operation, and is building more in different parts of the country. The plan of the administration is eventually to have thirty of these schools, with an attendance of approximately 7500 students, who will complete their training by practical experience on irrigated projects in the United States and other countries, returning to their own country able to assume the leadership in irrigation development.

THE NEW Mexican law provides that the present owners of irrigable lands are given the first opportunity to carry out irrigation works and develop the lands themselves. If they do not do this, the federal irrigation commission is empowered to take over and irrigate the lands, irrespective of the owners' desires, and to compensate the owners by returning to them a smaller part of the lands thus made more valuable through irrigation.

Developments to be undertaken within the next three years, it is announced, will entail an expenditure of some sixty millions of pesos ($30,000,000). President Calles has outlined a plan for the development of approximately twenty large and important tracts of land. He has arranged with a well-known American engineering company to design and

supervise the construction of the major portion of this program. Preliminary work has already been started by the American company.

The Mexican president is desirous of developing Mexican nationals in all phases of irrigation work, both technical and otherwise, and has stipulated that the American company must form a Mexican corporation for the purpose of carrying out these enterprises, and that at least four-fifths of the engineers and practically all of the non-technical labor must be Mexicans.

The American engineering firm, commenting on the magnitude and significance of the contemplated program, remarks: "It is regarded as the most important forward stride ever taken by the Republic of Mexico for its fundamental advancement."

ANOTHER important step in the advance of irrigation was taken when Secretary Work, on December 19, signed on behalf of the United States the contract which authorizes the commencement of construction work on the Kittitas project, in Washington. This step was epochal not simply because it sets in motion a great new reclamation project, estimated to cost some ten million dollars for completion, but has a significance that will extend far beyond the confines of the lands affected and even beyond the state of Washington, ushering in a new principle of reclamation development.

For the contract which was executed at the capital had already been signed by Governor Hartley of Washington, and involves a co-operative venture between the national and state governments, in which the state assumes the duty and responsibility of promoting the development and settlement of the Kittitas project after its completion. The work contemplated by the contract is to be done, it provides, in close co-operation between the Secretary of the Interior and the officials of the state.

The Kittitas project is itself a considerable undertaking, and one to which the people of Washington have been for a long time looking forward. It will develop the Kittitas division of the Yakima reclamation project, including about 70,000 acres of lands. Before it is completed it will cost, according to estimates, about $11,000,000. In newspaper comments from Washington, with few exceptions, there is evident a great spirit of rejoicing and optimism as a result of this decision to prosecute the undertaking without delay.

But the precedent set by the agreement between the state and the federal government will have a more momentous importance, either for weal or woe, far beyond the direct effects of the single project. The heads of the reclamation bureau have been advocating for a long time that the settlement of the reclamation projects was a matter for local supervision, for which the state government, as the agency most directly concerned and best able to assume control, ought to be responsible. That the state ought to have some such measure of responsibility has been urged, also, by many informed observers of the difficulties of reclamation.

That there is opposition to such a plan, from eminent sources, is true. Rhea Luper, state engineer of Oregon, attending a national conference on land settlement policies at Washington in December, stated the case for the opponents of the state-federal co-operation policy when he emphatically declared that the branch of the government that undertakes a project ought to be responsible for carrying it through to completion. Speaking for his state, he told the conference that Oregon does not believe the state should assume the obligation of financing settlers; that reclamation of large areas is a work for federal, rather than state, agencies, and that inasmuch as the reclamation fund is received directly from the states in which the projects lie, taxation for the purpose of extending state financial aid to settlers would be unreasonable.

There would seem to be little doubt, however, that there is a decided opinion in favor of trying out this new scheme of solving the most perplexing of reclamation's many problems, and the attention and interest of all reclamation interests will therefore be centered on the future career of the Kittitas project.

JUST AS this issue goes to press, the complexion of affairs with regard to the Colorado River is materially changed by the announcement that Hubert Work, Secretary of the Interior, has submitted to the senate committee on irrigation and reclamation a report in which he recommends a plan of development identical in essential details with that proposed in the Swing-Johnson bill. This turn of affairs should bring new and significant factors into the interplay of political considerations which surround the Colorado River and the various plans for its development. It is hailed by the advocates of the Swing-Johnson bill as a victory second only to the one which they expect soon to crown their efforts in the enactment of the measure as a law. With the bill as an administration measure, the position of the Swing-Johnsonites is appreciably strengthened. Secretary Work's endorsement was unexpected, and should prove the more valuable on that account. Proponents of the bill, few of whom were sincerely hopeful of its passage in the present session of Congress, are now jubilantly confident that legislative action will soon be taken.

Conserving and Controlling Western Waters

1-Underlying Principles of Water Conservation*

By FRANK ADAMS

Professor of Irrigation Investigations and Practice, College of Agriculture, University of California.

IT CAN safely be said that the time has gone by when, in the minds of the people, conservation means *non-use*, or merely saving for the future. Certainly there can be no conservation of water except through use, and, just as certainly, the water supplies at hand during one generation can not be held over for a generation to follow.

Our water resources are fixed. We can not increase them, we can not decrease them; it is not fully proved that we can permanently jeopardize them. But we can fail to use them and we can waste them; we can permit uneconomic uses to grow up and rights that are adverse to the general good to become vested that will entail a heavy burden on future generations to correct.

Conservation of water, however, means more than merely its use without waste. Through lack of adequate legal control and of proper coordination of the different economic uses of water, we can fail to obtain the greatest advantage from them—the largest material wealth to the West and to the Nation, the largest sum of human satisfaction.

IN THE aggregate, Nature has been bountiful to the West in the matter of water supply. But she has left us gigantic tasks in physically controlling it and making it available when and where needed.

She has given us basins in which to store it, head through which to drop it for the generation of power, land on which to use it for the production of food and many of the raw materials of industry, and for the establishment of rural homes. But it has been left to us and to those who come after to devise and set up the institutions under which it can be controlled in the interest both of individuals and of society, and under which we shall organize to build and operate the works required to use it.

When we think of conservation and control of water, therefore, we comprehend not only its best use for our present needs, together with all of the engineering and agricultural and institutional factors that govern that use, but also its use and control in such fashion that the largest permanent values shall be created. We think of it as a public trust, to be administered under proper and adequate public authority, and in such manner as shall fully satisfy our present wants, and still carry over to the future a capacity to produce wealth unimpaired by our mistakes.

VIEWING conservation of water in the broad way just described we can set out a number of very definite steps that have been taken in furtherance of the principles the term signifies. It seems well to have these steps in mind before considering possible or desirable changes in, or additions to, present procedure.

Long before the term conservation was applied to the efficient and economical handling of our natural resources, it was recognized in the western states that however worthy some individual, private use of the public waters might be, such use might very easily be adverse to the interests of others, or to those of the public at large. Accordingly, under the leadership of Wyoming and Colorado, the western states early set about establishing such administrative control of the public waters as would encourage and safeguard use, stabilize rights, eliminate conflicts, reduce or prevent waste, and protect the interest of those to follow.

Of the sixteen western states all but one now have State administrative agencies that are effectively functioning, in a greater or less degree, along the lines indicated. Their authority is not adequate in all of the states—in three for instance, the State Engineer or similar official has no authority to refuse a permit to appropriate water if considered against the public interest—but generally speaking, accomplishments under the State water codes have been outstanding. Certainly their enactment was the first essential step in water conservation.

ONE of the first principles of water conservation set up in the statutes of the western states was that beneficial use should be the "basis, the measure and the limit" of the right to appropriate the public waters in the West.

In line with the theory of this doctrine, both the state administrative authorities and the courts have constantly sought to reduce or eliminate waste, and in numerous cases with very great success, even to the point of accomplishing "economic" rather than merely "beneficial" use. In ten of the sixteen states there is either specific statutory limitation on the amount of water an appropriator may take, or else there is authority for approving applications for less than

**This is the first of two articles which* MODERN IRRIGATION *will present from Professor Adams' address before the recent meeting of the Western Division of the Chamber of Commerce of the United States on the subject of "Conservation and Control of Water in the Western United States." The second installment, which will deal with the relationship between conservation and reclamation, will appear in an early issue.*—EDITOR.

the amount asked for, if there exists any substantial reason therefor. When authority is not adequate, and such is the case in several of the states, sensible administration has accomplished what under the law could not be compelled.

Under the ever-increasing demands of irrigation, and following almost complete utilization of the supplies available for direct diversion, development of storage is going forward rapidly in practically all of the western states.

Colorado was the leader in irrigation storage as far back as prior to the passage of the National Reclamation Act. The system of exchanges between stored water and direct flow worked out in that State to overcome topographic handicaps was recognized as an achievement at least twenty-five years ago. A sufficient number of irrigation reservoirs had likewise been built in several of the other states, particularly Utah, to establish their high utility, but conservation for irrigation on a large scale through storage received its first great impetus under the Reclamation Act. A second impetus was given by the necessities of hydro-electric generation. Henceforth these two uses will be so inseparably linked together as the basis of storage in the West that storage for one of them alone will be the exception.

THIS brings us to one of the most important of underlying western water conservation problems—preference rights to water and coordination of uses. Obviously, this problem has been precipitated by the rapidly increasing water demands of power development.

In nine of the sixteen western states domestic use is definitely given a preferred status, and presumably the same rule would hold in the others. One-half of these states give irrigation the second place and agricultural interests strongly hold out for this.

As between irrigation and domestic uses, jurisdiction has remained almost entirely with the states. The control of water *per se* is admittedly exclusively a function of the state. However, because of its control over navigable streams and of rights of way over Government lands and reservations, jurisdiction by the Federal Government enters in connection with coordination as between other uses and power.

While navigation plays some part in Federal control of western waters as against other conflicting uses, it is a decreasing obstacle because of the generally greater importance in the West of irrigation. Indirect Federal control of waters by virtue of Federal jurisdiction over rights of ways across Government lands and reservations, on the other hand, enters in a very vital way and involves, at least potentially, a direct conflict with state authority. Even recently some feeling has arisen between Federal and State interests in connection with the granting of certain irrigation rights adverse to power, and in these matters some believe the states should govern.

With Federal control in these matters now almost exclusively exercised under the Federal Water Power Act, however, and with an apparent recognition by the Federal Power Commission that where full utilization of resources can be accomplished under State laws, Federal jurisdiction should not interfere, there

FRANK ADAMS

Author of the accompanying article, and a member of the Investigations Group of the Advisory Board of MODERN IRRIGATION, *which is introduced on Page 13.*

seems to be no immediate issue of great importance as between these two sovereign authorities. In what has just been said there has been no reference to any suggested assertion by the Federal Govrnment that it holds ownership and control of the unappropriated waters of interstate streams, a subject on which at least one Western state has some very definite opinions.

ALTHOUGH the Federal Water Power Act is first of all a power measure—the jurisdiction of the Federal Power Commission is limited to projects designed to produce water power only—we can not overlook the fact that every effort was made when the Act was drawn to safeguard the water needs of irrigation.

The Act specifically holds that, in issuing permits and licenses, the Federal Power Commission shall give preference to irrigation districts, along with other municipalities and the states, provided their plans are equally well adapted to conserve and utilize in the public interest the available water resources. Furthermore, each approved power project must be the one that is best adapted to the comprehensive utilization of the available waters for other beneficial public uses as well as for power.

While the maintenance of their own prerogatives demands that the States assert what they conceive to be their own best interests in the matter of the proper coordination of uses of their waters, still it is indeed fortunate that we have in the Federal Water Power Act an instrument of control that conceives the problem broadly. There is no phase of the conservation of our water supplies more in need of being considered from the standpoint of the larger social values involved. The first step in maintaining these larger social values is a thorough knowledge of the facts for each of the streams on which action is to be taken by either State or Federal authority. Happily this has been recognized by both the state and the Federal agencies concerned, as evidenced by the thorough physical investigations that have been made of the Deschutes, the Columbia, the American, and the Colorado.

These and other considerations of coordination as between power and other uses have begun to establish certain principles that underly the problem. Among these the following can be enumerated:

(a) That the basic western industry is agriculture, and that this industry in increasing measure needs power and must rely very largely on the revenue from concurrent hydro-electric developments for making the important irrigation developments of the future financially feasible.

(b) That to a very essential degree successful agriculture is dependent on the other industries that hydro-electric power makes possible.

(c) That if the largest possible public interest is to be served, neither irrigation nor power can be given a permanently irrevocable preference over the other without a very clear showing of economic justification after a long-time view and balancing of the public benefits to accrue.

(d) And finally, if this can be considered a principle, that very nearly, and sometimes complete, economic equalizing of flow for irrigation can be accomplished by storage close to the point of irrigation use without jeopardizing the interest of power, the converse of this also being true.

Other principles than these will become clear as we carry our development farther and learn from our added experience. If, in the meantime, in dealing with this question of coordination, we can but adhere to the broad principles of conservation that have already been defined so fully, we can look forward to the future with a satisfactory feeling of safety.

Fortier, Adams and Etcheverry Constitute Important Group on Advisory Board

Nationally Known Figures in Investigation and Research Activities of Industry Serve as Counsellors to Magazine

IN THE introductory issues of this magazine, the majority of the members of its Board of Editorial Advisors, who serve with their suggestions and counsel in all matters affecting fundamental editorial policies, were introduced by word and picture to our readers. Several groups of this board, however, remain to be presented.

B. A. ETCHEVERRY

One of these is the group of three prominent California authorities representing "Investigations and Research", formed as a most important division of the Board of Advisors at the time of the magazine's establishment. This group is shortly to be enlarged considerably by the addition of representatives of investigations and research activities of the industry in Oregon, Arizona and Utah, and probably several other western states; but the charter members are California men who are, incidentally, widely known in all parts of the west and in irrigation circles throughout the nation.

Samuel Fortier

SAMUEL FORTIER, after completing his early engineering education, was engaged for years in the construction and operation of water works, irrigation systems and related hydraulic enterprises in Colorado and Utah. Later he became director and irrigation engineer of the Montana Experiment Station, but resigned this position in 1903 to take charge of the State and National co-operative irrigation investigations in California. After spending six years in this work in California and other Pacific Coast states, he was promoted to Chief of Irrigation Investigations of the U. S. Department of Agriculture and called to Washington, D. C.

Dr. Fortier remained at the head of this Division for 18 years and during that time nearly every phase of applied irrigation was investigated and reported upon by his small force of trained engineers and scientists. This work which was carried on for the most part in co-operation with Western states and state institutions, has had a notably beneficial effect in defining and establishing the water rights of farmers throughout the Western states, in elucidating the principles on which the science and art of irrigation depend, and in greatly improving irrigation practice.

Dr. Fortier is the author of over thirty state and government publications dealing with irrigation and water supplies and his book on the *Use of Water in Irrigation* not only is a practical guide for the irrigation farmer but is used as a text-book in nearly all of the western colleges and universities.

In 1912 he was delegated to assist the ministry of British Columbia in formulating what is perhaps the best irrigation code and administrative system on this continent.

Dr. Fortier is universally known and admired by the entire irrigation industry, and is often referred to affectionately, as the "grand old man of irrigation."

Frank Adams

FRANK ADAMS is Professor of Irrigation Investigations and Practice, College of Agriculture, University of California.

Mr. Adams entered irrigation work on June 1, 1900, and with the exception of 4½ years has been in it continuously since that date. From June 1, 1900 to June 30, 1925, with the exception of the 4½ years noted, he was connected, first as irrigation assistant, next as irrigation engineer, and later as irrigation manager with the Irrigation Investigations of the United States Department of Agriculture. During this period he made field studies at one time or another in nearly all of the western states, but more particularly in California, Utah, Colorado, Wyoming and Nebraska.

From February, 1910, to June 30, 1925, he was in charge of the co-operative irrigation investigations conducted in California by the Federal Department of Agriculture, the California State Department of Engineering, and the College of Agriculture, University of California, this co-operation at various times including also the State Conservation Commission of California and the California State Water Commission, now the Division of Water Rights. Since July 1, 1916, he has been professor of Irrigation Investigations and Practice, University of California, the latter now also including the title of Irrigation Economist in the University of California Agricultural Experiment Station.

SAMUEL FORTIER

While necessarily dealing with the agricultural and, to a lesser degree, with the engineering phases of irrigation, Mr. Adams has always been interested in the public and institutional phases of the subject. In 1912, he organized the Conservation Section in the Commonwealth Club of California and was its chairman until the section was subdivided into a

Arthur P. Davis Describes Plan to Bring New Water Supply to East Bay Cities

Tells Engineering Features of Mokelumne River Project, Key Unit in East Bay Municipal Utility District's Program

By ARTHUR P. DAVIS

Former Director U. S. Reclamation Service; Chief Engineer and General Manager, East Bay Municipal Utility District.

ANYTHING written by Arthur P. Davis, internationally known authority on hydraulic development, is assured of an interested reading in the irrigation, water works and allied industries. When he describes, as he does in this article, one of the most significant developments now going forward in municipal water development in the West, the result is of two-fold value. The East Bay Municipal Utility District, serving nine municipalities with an aggregate population of almost half a million people, has had to face unusual problems, and in preparing to meet them has planned on a vast scale to bring water from high in the Sierra Nevada Mountains. The first unit of the district's program, as described here in detail, involves a cost estimated to require a bond issue of $39,000,000, and will deliver about 60,000,000 gallons per day to the district.

THE East Bay Municipal Utility District was organized May 22, 1923, comprising the cities of Oakland, Berkeley, Alameda, Piedmont, Richmond, San Leandro, Albany, Emeryville and El Cerrito. These cities are all contiguous and have a combined estimated population of about 450,000 people. They are all served with water by the system of the East Bay Water Company and the District was formed for the purpose of acquiring this system and for bringing in an additional water supply from a suitable distant source.

The District

The District organization was the result of a great many years' agitation, study and effort to bring to the East Bay region an adequate water supply. The District is now largely built up and is virtually one city. It contains nine municipalities which were formerly actually and, at present, legally are different cities. They were formerly served by not less than 12 different corporations. By various processes of consolidation, purchase, re-organization and so on, they have been fully merged into the present East Bay Water Company.

Water supply was originally drawn mainly from wells and a few springs. These were supplemented by the construction, in 1874, of Lake Chabot on Lower San Leandro Creek. Since that date, this reservoir has been an important water source of the system but a large portion of the present water supply is still obtained from wells. For more than twenty years it has been recognized that the system was inadequate, and the condition has been met from time to time by small additions, either of wells or of reservoirs, but never has any assured supply been adequate for any considerable growth or for unusual drouth. Serious shortage occurred in 1918, and one still more serious has been imminent for the past two years.

WHEN the spring of 1924 arrived without the usual winter rainfall, the East Bay Water Company, appreciating that its reservoirs were very low and that they could not be replenished for many months, increased its pumping facilities to a capacity of about 21 M. G. D. or more than two-thirds of the amount being delivered. The balance was drawn mainly from reservoirs on San Pablo and San Leandro Creeks.

The heavy draft on the wells, together with the depletion of the supply caused by the long, dry period has lowered the water plane of the pumping district to an alarming extent. In the Alvarado region, from which most of the pumped water comes, careful observations have been taken upon five wells which are typical of the position of the water plane. Prior to 1918, none of these wells had ever shown a stage below sea level. In that year, one of them went slightly below but soon returned above and all of them remained above sea level until 1920 when four out of the five were drawn below sea level dur-

Lancha Plana Damsite, (looking down stream). It is here that water will be impounded by a high dam, to be carried across the San Joaquin Valley through a great aqueduct, and delivered to nine East Bay municipalities, with a population of almost half a million.

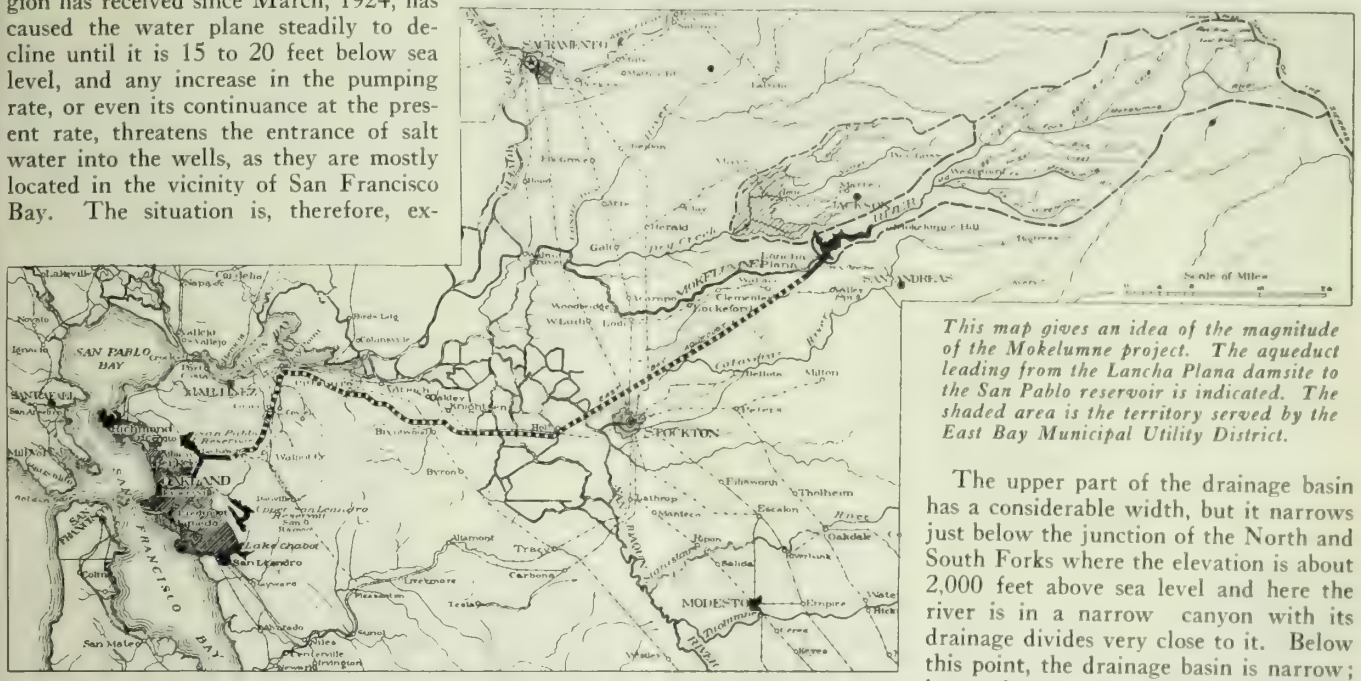
ing the dry season to the extent of about 7 feet. The water levels in these wells returned to a stage above sea level in the spring of 1921. The same thing occurred in 1922 but in 1923 the water level in four of these wells declined below sea level, and the winter of 1924 was so dry that the water level in all of them continued to decline under the gradually increased pumping demands.

The vigorous pumping that this region has received since March, 1924, has caused the water plane steadily to decline until it is 15 to 20 feet below sea level, and any increase in the pumping rate, or even its continuance at the present rate, threatens the entrance of salt water into the wells, as they are mostly located in the vicinity of San Francisco Bay. The situation is, therefore, extremely critical and, unless the present winter produces more rainfall than last winter, there wil be a severe and disastrous shortage of water in the East Bay District.

THE FIRST tax levy of the new district became available the first day of July, 1924, and a large force of engineers and surveyors were put to work immediately upon the selection and survey of the most promising of the water sources. A board of consulting engineers, consisting of General Geo. W. Goethals, William Mulholland and Arthur P. Davis, in September, 1924, after a comparison of the surveys and estimates of the various sources investigated, decided that the most promising and economical source, satisfactory for the purpose, was the use of the Mokelumne River with a high dam near Lancha Plana, where water would be stored and piped to the District through an aqueduct across the San Joaquin Valey.

This board recommended a bond issue of $39,000,000 as being adequate to bring in, without peradventure of failure, the first unit of this project to deliver about 60,000,000 gallons per day within the District, and to provide reservoir and tunnel capacity for a larger amount to be utilized by building additional pipe lines across the San Joaquin Valley, as the needs demand them.

Plans and specifications for the first unit were issued and bids invited in June, 1925, to be opened September 4 of the same year. These bids were remarkably favorable, showing keen competition between steel manufacturers and others for the work. The prices under which the contracts were let indicate that the work will be accomplished from 20 to 25 per cent under the liberal estimates that were made to cover all contingencies.



This map gives an idea of the magnitude of the Mokelumne project. The aqueduct leading from the Lancha Plana damsite to the San Pablo reservoir is indicated. The shaded area is the territory served by the East Bay Municipal Utility District.

The Project

Rising at the crest of the Sierra Nevada range of mountains, the Mokelumne River flows in a general direction a little south of west, and empties into the San Joaquin River near Central Landing. The drainage area of the river at Clements, where it emerges from the foothills, is 632 square miles. At this point, a station is maintained by the United States Geological Survey for measuring its discharge.

The river has three principal branches known as the North Fork, the Middle Fork and the South Fork. The areas drained by these tributaries are, respectively, 370 square miles, 70 square miles and 76 square miles. The North Fork is fed by the tributaries Antelope Creek, Mill Creek, Tiger Creek, Panther Creek, East Panther Creek, Bear Creek, Cold Creek, Summit Creek, Deer Creek, Blue Creek and Moore Creek.

As is evidenced by its greater drainage area, the North Fork is the main stream. It has more than two-thirds of the drainage area and more than three-fourths of the discharge. It is the only fork that heads at the summit of the Sierras where the precipitation is greatest.

The Middle Fork joins the South Fork before it reaches the main river. The drainage area above the junction of the North Fork and the South Fork is 523 square miles.

The upper part of the drainage basin has a considerable width, but it narrows just below the junction of the North and South Forks where the elevation is about 2,000 feet above sea level and here the river is in a narrow canyon with its drainage divides very close to it. Below this point, the drainage basin is narrow; hence the water supply comes from the higher mountains, mostly above 2,000 feet in elevation.

Only a small part of the water supply has been diverted but this includes all of the low water flow of normal seasons.

THE Pacific Gas and Electric Company has developed a power system in the basin of North Fork, the power house being located a few miles northeast of Mokelumne Hill at a point called Electra. This power system includes five small storage reservoirs, at Twin Lakes, Upper Blue Lake, Lower Blue Lake, Meadow Lake and Bear River. These reservoirs aggregate about 26,000 acre-feet in storage capacity. Their waters are released into the natural stream channels and flow to the headworks of two ditches on the North Fork, one having a capacity of 135 second-feet and the other 75 second-feet. These two ditches parallel each other along the north side of the river and each has a small forebay reservoir and penstock leading to the power house on the main river. The available head from the higher reservoir is 1466 feet and that from the lower, 1266 feet. The power house has an installed generator capacity of 20,000 K. V. A., and its water wheels have a ca-

A TYPICAL GRAPE-FRUIT GROVE IN THE LOWER RIO GRANDE VALLEY. THERE ARE 3,000,000 CITRUS TREES NOW GROWING IN THIS DISTRICT.

How a Rio Grande District is Reconstructing Its System

By W. L. ROCKWELL

Supervising Engineer, Hidalgo County (Texas) Water Improvement District No. 4

A PLAN of reconstruction which has been undertaken by the Hidalgo County Water Improvement District No. 4 in the lower Rio Grande Valley, Texas, is of more than local significance. It is the first step toward the union, into one system, of all the second bench irrigated interests of the valley (comprising more than 150,000 acres), which will mean conservation of water, cheaper rates and better service for all this territory. The reconstructed system, which will be completed and placed in service in May, 1926, is therefore one of the most interesting developments taking place in this important irrigated area.

The plan involves a change in the point of diversion of the district's water supply, and the rehabilitation of the entire distribution system. The benefits to be accomplished by it are manifold. It will provide a permanent and safe pumping site; the canal system will be placed entirely above overflow; the district will have but a single pumping plant to operate and maintain; $150,000 will be saved in installation cost; the pumping head will be reduced twenty-five per cent, and the cost of operation and maintenance thirty per cent.

A GENERAL understanding of some of the characteristics of the whole valley is essential to an appreciation of the reconstruction plan of Water Improvement District No. 4. The Lower Rio Grande Valley includes the delta of the lower river extending in an easterly direction from the town of Mission, Texas, to the Gulf of Mexico, a distance of about 80 miles. The valley lies in the form of an isosceles triangle with the apex near Mission, and the base the Gulf coast. The Rio Grande in its meanderings nearly bisects the triangle, the United States and Mexico sharing about equally in the area of agricultural land of the delta, aggregating, perhaps, 1,000,000 acres.

The banks of the river, like those of all delta streams, are higher than the ground surface to the north or south, the slope being down the river and away from the stream at a rate of about one foot per mile, producing a resultant toward the northeast of about 1½ foot per mile. This slope continues north for five to ten miles, to an abrupt rise of 20 to 30 feet, from which the slope continues eastward and finally merges into the Gulf coastal plain.

The topography of the first bench is quite level; that of the second bench slightly rolling, allowing sufficient slope to give good surface drainage. The Arroyo Colorado and its tributaries are the remnants of an old river channel and form the basis and outlet for an excellent drainage system for the first bench lands of the alley.

The climate of the valley is semi-tropical. The temperature is such that crops may be produced continuously throughout the entire year. A light frost occurs nearly every winter, but seldom is there one that is destructive to plant growth, even of tender vegetables. The annual precipitation in the lower valley varies from nearly 30 inches on the coast to 20 inches at Mission. Unfortunately the rainfall is very uncertain both in time, interval and quantity. There is no certainty in either time or volume in any given year; hence all agriculture is dependent on irrigation. The valley has as fertile a soil as can be found in this or any other country. This is verified by the wide variety and prolific yield of its products.

The source of the water supply of the valley is the Rio Grande. There are now under irrigation on the American side of the river upwards of 250,000 acres. At least 500,000 acres have acquired a permanent right to the use of water by reason of continuous development and beneficial use. A large quantity of the diverted supply is undoubtedly wasted, but this waste is being gradually reduced by the installation of meters, by the lining of canals, and by better methods of land preparation and water distribution.

EARLY settlers in this district turned their attention to the growing of vegetables for the winter and early spring markets. In some instances large returns were received, but, on account of poor transportation and marketing facilities, the larger number were unsuccessful.

Here and there a farmer planted a few orange, lemon and grape-fruit trees. In two years these began bearing an excellent quality of fruit which brought large returns. This created an interest in citrus production and the acreage increased, until at present the citrus expert of the U. S. Department of Agriculture estimates that there are 3,000,000 citrus trees growing in the valley.

Vegetables of excellent quality are being grown to supply the winter and early spring markets of the north and east, and transportation facilities are rapidly improving. Dairying is very profitable.

The climate and every other condition are conducive to cheap feeding of the dairy cow and to a large milk and butter-fat return. Long-staple upland cottons produce large yields, and under intensive work should produce 750 pounds of lint per acre.

THERE are thirteen independent irrigation projects operating in the valley, in addition to a number of small plants. Eleven of the projects are Water Improvement Districts, organized under state provision, and two are private corporations. They include 450,000 acres, a corporate investment of more than $20,000,000 and a farm value of $135,000,000. A very conservative valuation of the capital represented in these projects is $155,000,000, which does not include values in towns and other properties.

Hidalgo County Water Improvement District No. 4 is situated in the western portion of the delta. Its population is about 2,000. The town of Edinburg is situated within the district's boundaries, but is not a part of the district. The town of McAllen, with 4,000 population, is near the south end of the district, and Mission, with 5,000 population, is only three miles west.

The gross acreage of the district is about 40,000 acres, which, with roads, canal right-of-way, building sites, high and low lands deducted, leaves approximately 34,000 acres of irrigable, cultivable land. The project has no land on the first bench, hence no overflowed lands. The surface slopes toward the north and east at a rate of from one to five feet, permitting of fair gradients and reasonably cheap canal construction. The fields have fair slopes for the distribution of water for the disposal of excessive rainfall.

The area receiving water may be increased as much as 10,000 acres by supplying land which lies along the Penitas main, and which has asked for water by special contract.

IN the reconstruction undertaken by District No. 4, the point of diversion was moved up the river a distance of ten miles. The re-location is situated upon the north bank of the Rio Grande, about eight miles west of Mission, in the Mexican pueblo Penitas, and is upon a bank of heavy residual clay, the bottom of which has not been reached. The channel of the river is about 1,500 feet distant and is slowly moving toward the plant side. As far back as records have been kept, 1853, the channel has remained very close to its present location, old Mexican residents declaring that eighty years ago it flowed alongside the plant side.

East main headgates, Hidalgo County Water Improvement District Number Four. The district is now moving its diversion point up the river a distance of ten miles.

Briefly, the plans for the new work on the reconstruction of the system call for the excavation of a channel, nearly fifteen hundred feet long, extending from the river to the plant site, the bottom of this channel to be six feet below extreme low water, to be thirty feet wide upon the bottom, the side slopes to be two horizontal to one vertical, the levees to be carried well above extreme high water, and to have a ten-foot crown. A small canal will be placed along the top of these levees in which water (fed from the surge tank) will be run. Bermuda grass will be planted on the top and slopes of all levees.

The power house and intake bays will be monolithic reinforced concrete, the floor of the bays six feet below extreme low water. The building will be 48 feet by 101½ feet inside measurement, the walls reinforced by counterforts spaced eight feet apart and extending from floor to top of wall. The roof will be of corrugated iron, supported by steel trusses. The floor will be monolithic, six feet thick, and heavily reinforced.

THERE will be installed six pumping units of the same size, all parts interchangeable. The engines will be three hundred and sixty horse power, full-Diesel, and direct-connected to 30-inch horizontal, double suction, centrifugal pumps, of 30,000 gallons per minute capacity. The suction and discharge pipe will be 48 inches in diameter, the suction intake bell mouth, increasing to a diameter of five feet. The pumping units are to be set staggered in three lines, the suction and discharge pipe passing under and between the pump and engine of the units either side, permitting of a very compact installation. Lighting, priming, air starting, cooling, and fuel and lubricating oil cleaning units will be provided, and a five-ton crane will be installed.

Each pump will discharge through a 48-inch pipe to a 48-32 Venturi meter with recording device for second foot discharge and continuous record. From the meters the water passes through a surge tank to seven-foot square twin tubes of re-inforced concrete, 1154 feet

(Continued on Page 40)

Placing the steel for the tubes under the Shary Canal—one of the interesting tasks included in the reconstruction plans of Water Improvement District No. 4 described in the accompanying article by W. L. Rockwell. The district is taking the lead in a program in which all "second-bench" lands are expected eventually to join.

Making *Irrigation Credit* What it *Should* be

Some Considerations of District Finance That Will Conserve This Invaluable Asset

By B. J. SEGER

Secretary-Treasurer of the North Platte Valley Water Users Association and the Farmers Irrigation District, Scottsbluff, Nebraska.

LARGE IRRIGATION projects will, in times of emergency, such as a serious break in the canal, need to borrow large sums of money; greater than the local banks can loan, as a rule, because of the length of time the loan must run before being paid.

A trust company or some other large financial institution is the usual agency for large loans. At such times it is highly important that an irrigation project have its credit well established. A record of prompt payment of taxes by the landowners and the prompt payment of the obligations of the district will aid materially in establishing this necessary credit.

It is important that the officials of an irrigation district maintain the collection of irrigation taxes as near one hundred per cent as possible so that the district may be on a cash basis. If on a cash basis, there would be no warrants to issue and no interest or discounts to pay as far as operation and maintenance of the system are concerned—a tremendous saving over a period of years. Under large projects where the cost of building the project has been comparatively high, resulting in a rather heavy tax, it is found advantageous to provide that the landowner may pay his irrigation taxes in two installments. The laws of a number of the western states now provide that irrigation taxes, as well as other taxes, may be paid in this manner. In some states a discount of five per cent is allowed if taxes are paid when due. The discount features would encourage payment of taxes when due, and two payment dates would enable men of small means to pay, who might find it impossible to pay the entire tax at one time.

OFFICIALS of many irrigation projects make the mistake of not taking more interest in the individual farmer on the project. As mentioned in the first article in this series, there are many ways in which a district board can assist the individual farmer in addition to giving him good water service. Pests may threaten to ruin his crop. Prompt action on the part of the board in securing the necessary material and equipment to combat the pests may be the means of saving his crop. He may be short of labor at a critical time. The board can often assist materially in securing the needed help. Anything that the officers of a project can do to assist the farmer in time of need will mean more than the saving of crops. It will mean the friendship and good will of the farmers on the project. With successful, satisfied farmers and with proper management, the project will be a success and its securities will be rated first class.

If officers of an irrigation system give some consideration to the purchaser of the securities they may have to sell, such as making provision for the payment of interest on warrants which run longer than a year, also providing that coupons on bonds shall bear the same rate of interest as the bond if the interest is not paid when due, their securities will sell more readily and at a good price. Sometimes a type of bond is issued which is not salable. For instance, the rate of interest may not be in line with the condition of the bond market at the time the securities are offered for sale. Securities which, on account of type, are difficult to sell, must be sold at a greater discount. It is a good plan when considering the issuing of securities to consult several bond houses, to ascertain the condition of the bond market, and the type of bond which would sell most readily; also to follow carefully the instructions of a good bond attorney in the preparation of the bond history, etc.

AGAIN, if district officials would realize the importance of establishing a "seasoned bond"—a bond on which default has not been made in the payment of its interest coupons or principal for at least four years, they would never allow a default to be made. A district having a "seasoned bond" will have no difficulty in refunding if advantageous to do so, or in floating additional bonds or other evidences of indebtedness. Care in this matter would be of material help in maintaining the credit of the district.

As a rule, a serial bond is more desirable for both the district and the buyer. A serial bond issue which provides for the retirement of a definite number of bonds each year is the best for the project for the reason that it is reasonably certain that the debt will be paid during the life of the bond issue, and, further, that there will be a material saving in interest over the semi-serial type of bond. Usually a bond house prefers a serial bond for the reason that some of their customers desire short-time maturities, others, long-time maturities. This type of bond is better for the additional reason that as early maturities are paid the security back of the remaining unpaid bonds grows better each year.

An important factor in bringing irrigation securities to a higher plane, so that they will have the same rating and standing as any high-grade securties, is that laws be enacted whereby the state will provide for the careful inspection of every proposed irrigation project within the state. The state engineer should make report as to its feasibility, water supply and his estimate of the cost of building the project. Many irrigation projects have failed because a careful estimate of the cost was not made in the beginning.

In addition to the report by the state engineer, there also should be a report made by the director of the State Geological Survey. He should make exhaustive tests of the soil, as to its productivity. He should also make thorough examination as to the texture of the soil, so that he will be in position to report as to the probability of seepage. The state's attorney-general should then pass on the legal phases. It would also be well to consult an expert on irrigation finance and secure a report as to the best method of financing the proposed project. Finally, the land should be classified into at least four classes and classification maps prepared.

IN SOME states, a commission is formed consisting of the above named officers for the purpose of passing on all proposed irrigation projects. In states where such a commission has been in operation for a number of years the plan has been found quite satisfactory. Projects organized with the approval of such commissions have had no difficulty in selling their securities at a good price.

(*Continued on Page 33*)

This article by Mr. Seger is the second and concluding installment of a series of two which he has written for MODERN IRRIGATION, *on the general subject of "Credit for Irrigation Projects — How to Establish and Maintain It." The first article appeared in the December issue.*—EDITOR.

When Progress Came to the Peaceful *Valley* of *Content*

How a Small Dam, Skilfully Planned, Brought Water for Irrigation and Domestic Use to the Willits Valley

By CRISTEL HASTINGS

FOR UNNUMBERED years the peaceful Willits Valley lay dreaming in the sun, a typical valley of content, whose good people appreciated above all else the serene peace of the hazy, oak-clad hills sloping down the skylines all about, and who absorbed of this peace until life had become a most tranquil thing, indeed.

They dreamed, too—these people in the Mendocino valley lands — of the great things that Progress eventually would bring them over the Redwood Highway, but to many of the contented ones there seemed no especial need for hurry. Irrigation was looked upon as an Herculean undertaking—quite beyond any immediate need. To the isolated farmer "expense" can assume the proportions of a most terrifying bugaboo, especially if it concerns a project of which he may have little or no knowledge.

True, the valley lands all about were intensely fertile, but much of the rich alluvial soil lay barren of crops, more or less, as irrigation was but a fitful thing that depended almost solely on the fickle generosity of Pluvius! Although life was a bit primitive in some sections —pump handles still had to be put into vigorous action morning and night, and lamp chimneys had to be polished daily —life on the valley farms largely followed the beaten trail of yesterday.

IT WAS inevitable, however, in spite of the charm of existence among these peaceful hills, that this rich region (one of the richest in California) should be discovered by engineers, who instantly appreciated the natural site for a lake that was to be; and into whose great basin the waters of James Creek now flow, where they are impounded for domestic and irrigation purposes. For engineers did come, in 1923, and their vision from a hill-top pictured a lake of flowing silver that could and would be converted into golden use for the good people of the valley and town only five miles to the northeast. The names of Edward Morris andC. E. Grunsky of the American Society of Civil Engineers, are marked indelibly into the newer chapters of Mendocino County's progressive history, and the name of the former has been given to the dam which he envisioned.

Recognizing the oboing, stump-strewn, manzanita-clad hollow among the hills as an ideal water-storage basin, and discovering, too, the fact that nature had already provided a narrow outlet at the lower end of this gently sloping depression flanked on both sides by towering walls of solid rock, the engineers found their problem relatively simple. How this natural and most ideal site, five miles southeast of an important and thriving community on the famous Redwood Highway, ever came to be overlooked all those idle years remains a mystery; but overlooked it was, until the splendid project that now insures the Willits Valley an adequate water and power supply became something more than a dream.

NOT ONLY was it possible to build a dam of unique construction at the mouth of this abrupt gorge, but the natural advantages of the lake site made for an economic saving in the building of the Morris Dam totaling many thousands of dollars. This proved particularly fortunate in that the introduction of any innovation, especially if it be a utility project, usually meets its most strenuous opposition because of the expense involved.

The presence of the narrow and very abrupt gorge at the lower end of the lake site saved many dollars. This gorge proved to be the solitary outlet, making it entirely practical, because of the walls of solid rock on both sides of this narrow cleft, to build a thin arch type of dam, of which there are but few in the West. Measuring 107 feet from end to end, this slender crescent of reinforced concrete and steel bars, with its 90-foot radius, stands 40 feet high—with a base width of 8½ feet, the latter gradually tapering to a 3-foot thickness at the top.

The Morris Dam, Willits, California, an interesting example of the thin-arch type of structure.

The Morris Dam was barely completed when it was called upon suddenly to prove its tensile strength of 350 pounds to each square inch of wall surface. While the concrete was still "green" and but a few days more than two weeks old, the dam was subjected to the ordeal of weathering a sudden storm that made of James Creek a swollen, vicious thing that filled the new dam to overflowing. But its builders had builded well, and when the peak was past, dawn found the gray wall still upright.

The wall is reinforced at 12-inch in-

VOL. II JANUARY, 1926 No. 1

Introducing Volume Two

WITH the beginning of 1926, MODERN IRRIGATION opens its second volume. The magazine was established in July, 1925, and has published six issues preceding the current number. As was expected, the first six months have been largely a matter of getting the journal's feet on solid ground. With the present issue, the magazine enters upon a new era in its career.

The service which any publication can render, presupposing that it is sincerely actuated by motives of service, depends primarily on the support accorded it by advertisers. So far, MODERN IRRIGATION has been most generously supported, but because it was established in the middle of the year, when many advertising appropriations were fully allotted or exhausted, it has, perhaps, not had quite as broadly representative a content in its advertising pages as will be brought about by the new year. In this issue, several new accounts are in evidence, and many others will be added during the next few months. Each of these enables the magazine to give more valuable service to its readers, and, accordingly, increases its worth to its advertising patrons. Nineteen-twenty-six should be a year of splendid growth; in fact, developments thus early justify the assertion that Volume II will make MODERN IRRIGATION a very materially larger and better magazine.

The Mexican Policy

THE WISDOM of a law depends not so much on what is written in the statute book as on the spirit of its enforcement and administration. For that reason it is still much too early to judge of the probable effects of the irrigation law passed late in December by the Mexican Congress. This law declares irrigation a public utility and creates a federal commission with the power to take over undeveloped lands with or without the approval of the owners in fact, and to develop their potential irrigation resources for the government, returning a part of the irrigated lands to the owners as compensation.

The law is directed against an acknowledged evil—the prevalent practice, on the part of large landowners, of holding huge acreages in an undeveloped state. It includes a wise provision, also, in that it gives the owner of the land the opportunity to undertake irrigation development without government interference if he will do so. Under the most fortunate circumstances, therefore, it may be productive of much good. The large land-owners, under the threat of government confiscation, may be moved to an activity which will be socially salutary for the Mexican nation.

On the other hand, there are many forceful examples of government control of irrigation development that should give pause to any such wholesale adoption of a policy of government ownership and operation (which it will amount to) in a country no further developed in the science of government than is Mexico. The United States' experience with reclamation under political control has not been sufficiently inspiring to justify optimistic hopes for the success of the new Mexican policy. And yet the United States is certainly more stable, politically and economically, than is the Land of Manana.

But there is opportunity in Mexico for practically unlimited agricultural expansion, if efficient methods of irrigation are brought to the assistance of the farming class, and the recent action of the Mexican Congress would indicate, at least, that these opportunities are to have recognition. President Calles has already made plans for a development program to involve the expenditure of ten million dollars a year for each remaining year of his term of office. If this money is economically and wisely spent, it may mean the introduction of a great new day for the southern republic.

An Interesting Situation

FACED with unique problems of irrigation, and somewhat separated from the more intensively irrigated areas of the far west, is an important province of the irrigation empire, located in the lower Rio Grande Valley. Here are approximately a million acres of ir-

POINT *Of* VIEW

rigable land, about 250,000 of which, situated on the American side of the river, an international boundary line, are under irrigation. In this issue an authority in the development of this section describes the reconstruction plans of a district which is taking the lead in improving the facilities for diverting and distributing the water supply of the whole section.

The lower Rio Grande has pressing problems in addition to the fiscal and engineering difficulties which it faces. The water supply of the Rio Grande has been practically fully appropriated. In order to extend irrigation, storage works are required. And in order to plan storage works on the river, the consent and approval of Mexico are necessary. Mexico, through its superior tactical location with respect to the source and course of the river, holds the whip-hand in negotiating for such developments, and is entirely cognizant of the fact. The situation, therefore, is one which will repay study by the entire irrigation country, for Mexico's interests and those of the United States are in conflict in more regions than one, and any factors which affect the situation, whether on the Pacific or on the Gulf Coast, will be important in the final determination of rights. Articles discussing various features of this interesting situation will have place from time to time in these columns.

"The Open Forum"

UNDER a department heading newly introduced in this issue, entitled "The Open Forum", C. W. Brockman, a director of the Imperial Irrigation District, expresses his version of the views of the minority element in the Imperial Valley, which opposes the policies of the four majority directors. It is the purpose of this magazine to give expression to both sides of controversial questions, in the interest of fairness and of informing the public as to the issues involved, and Mr. Brockman's statement is published at the request of himself and his friends in reply to an article in a recent issue by Earl C. Pound, president of the district, in which Mr. Pound gave an interesting interpretation of the re-organization policies which were recently undertaken there.

In the "Open Forum," from time to time, the magazine will present the variant views of informed men who are interested in one side or another of significant questions in the field of water development. The department will be conducted in conformity with the pronouncement of that great American who was always ready to recognize that his bitterest oponents were entitled to hold and to support their views, and whose principle for dealing with them was "malice toward none and charity toward all."

From the standpoint of interesting reading, this department should soon come to be the most lively and appealing of any in the entire magazine, but it is introduced with the hope that it may accomplish more than that—that it may, in some cases at least, point the way to the harmonizing of the conflicting views presented, in the interests of concord and progress for the industry as a whole. For this reason the editors have asked that contributors should avoid personalities, should make their criticisms constructive, should base their statements not on opinion but on fact, and should observe a temperate and courteous attitude toward those who may not be in agreement with their ideas.

Defining a District's Powers

LEGAL POWERS of an irrigation district, as constituted under the laws of California, do not include the right to expend the district's funds for the support of, or opposition to, pending legislation, it has been held by a court decision. The decision came as the result of an action directed at restraining the directors of the Imperial Irrigation District, in California, from spending more money in the interest of the Swing-Johnson bill. As a consequence of the opinion rendered by the court, the directors have gone formally on record ordering that no further moneys shall be spent for such purposes.

The decision is important, not so much for its effect on the destiny of the particular legislative proposal involved in this case, as for its general application in other districts and with regard to other measures in which the officials of an irrigation district may feel justified in spending the public money in order to influence the outcome.

Its effect on the fate of the Swing-Johnson bill will probably be negligible. The directors are admittedly strongly in favor of the plan of Colorado River development outlined in this measure, and they have spent considerable money, in one way or another, to further it before Congress. All of this, they point out, has been spent only on the advice of their attorneys, and not only of their present legal advisor, but of every attorney which the district has employed, all of whom have agreed in the opinion that such expenditures were strictly within the legal powers of the district. Now they have put a stop to these expenditures, but an un-official organization of the Imperial Valley, favoring the Swing-Johnson bill, has undertaken to assume the responsibility for continuing the representation of the bill's advocates at Washington.

This, it would seem, is as it should be. Regardless of the merits of the Swing-Johnson bill or any other proposed method of developing the Colorado River, it is indisputably a fact that there is a considerable element in the Imperial Valley that does not want to see the district's funds spent in lobbying in favor of the measure. Those who favor it are entitled to spend their money in its support, but those who do not should not be compelled to contribute for the purpose. The decision of the court which holds such appropriations to be outside the legal powers of an irrigation district is important in defining the functions which the officials of an irrigation district may properly exercise.

THE OPEN FORUM

INTRODUCING a new department in which our readers may present their views on significant questions of general interest to the whole field of water development. Contributors are requested to avoid personalities, to make criticisms constructive and temperate, and to base all statements on fact rather than opinion. The editors will reserve the right to abridge or reject contributions at their discretion.

A DISSENTING INTERPRETATION

By C. W. BROCKMAN

Minority Director, Imperial Irrigation District

THE IMPERIAL Irrigation District is located in the extreme southern part of California and comprises 603,000 acres of land, of which approximately 515,000 acres are irrigable.

The source of its water supply is the Colorado River and the water is conveyed through 137 miles of canal in Mexico, thence to the United States. The daily diversion varies from 2,000 second feet to 7,000 second feet and averages about 3,500,000 acre feet per annum.

The Imperial Irrigation District delivers water from its canals in Mexico to approximately 200,000 acres of Mexican land, for which it receives a revenue of from 500,000 to 600,000 dollars per annum.

DUTIES of the District may be defined as follows:

1st—To construct and maintain seventy-one miles of protective levees, of which thirty-two miles are along the Colorado River. Fifty miles of levee are protected with standard gauge railway and are heavily riveted with rock on the water side. These levees are located in Mexico and protect the Valley from the encroachment of the waters of the Colorado River.

2nd—To maintain diversion and headworks to assure an ample supply of water in the canals at all times.

3rd—To maintain one hundred thirty-seven miles of canals in Mexico, delivering water to users in Mexico and to various points in the United States.

4th—To operate and maintain one thousand six hundred sixty-nine miles of canals and laterals in the United States. with over four thousand six hundred delivery gates or turn-outs.

5th—To distribute water to five thousand users on less than twenty-four hours notice, any day of the year.

6th—To maintain five hundred six miles of surface waste ditches for removing waste water from a considerable portion of the District lands.

7th—To locate and construct drainage outlets for the entire District.

8th—To maintain one hundred six miles of drainage outlets and control the Alamo and New River channels.

EVERYONE concerned with irrigation is naturally interested in the affairs of the Imperial Irrigation District, in Southern California, probably the largest organization of its kind in the world. For that reason, when recent developments indicated that a wholesale re-organization of the big district was in progress, MODERN IRRIGATION *asked President Earl C. Pound for a statement. His story, headed "What the Board of Directors of the Imperial Irrigation District is Trying to Do," appeared in the September issue. Mr. C. W. Brockman, minority member of the Board, now comes forward to declare that Mr. Pound's story was only one side of a very two-sided question, and requests that, as a representative of the opposition, he be given opportunity to present his version of the somewhat involved situation.* MODERN IRRIGATION *is not, very obviously, the proper place for unlimited debate upon controversial questions; neither does it feel that it necessarily "started something" when it printed a straightforward explanation of an irrigation district's plans in the form of an official statement from its president; but since Mr. Brockman feels that he should have his day in court, his communication is given space. Having heard from both the affirmative and negative on this subject,* MODERN IRRIGATION *considers the matter closed and has no desire to continue the discussion.*—EDITOR.

TO PERFORM these duties, five directors, a treasurer and an assessor and collector are elected. All duly registered voters, living within the boundaries of the District, either on farms or in towns or cities, have the right to vote at all district elections.

The inventory value of the District System is approximately twenty-five million dollars. The average number of employees is twelve hundred and the annual expenditure for all purposes is between $3,000,000 and $3,500,000.

With a project of this magnitude, those who are interested in seeing the Imperial Irrigation District maintained as a successful, business like enterprise, are anxious that it should have the best trained and most experienced direction. They therefore, believe that the majority of the Board of Directors have acted very unwisely, and have been actuated by a desire for increased personal authority, in the recent limination of many of the district's most experienced employees, including its attorney, consulting engineer, esgineers and assistants, mechanics, bookkeeper, purchasing agent and costkeeper, some of whom had been connected with the affairs of the valley for sixteen years. The majority of the directorate have now taken over a large part of the authority asd responsibility formerly delegated to the eliminated employees, and have shifted the remainder to less experienced men.

DURING the latter part of 1924, three of the five directors planned to rearrange the boundaries of the district's directors' divisions, with the purpose of eliminating two members of the board who were not in harmony with their program, and in so doing, passed a resolution to remove the general offices from Calexico to Imperial. This removal involved an expense of more than $100,000, which might otherwise have been devoted to necessary work on the system.

This action resulted in the elimination of one of the two directors at whom it was presumably aimed, and the election of a new director. The election of this new director was attacked in the courts, and by Judge Burnell was held to be invalid. On an appeal of this decision, the director is now holding office pending the decision of the California Supreme Court.

These moves were made for the purpose of economy, the majority of directors assert, but the writer and other critics of the policies believe that they were actuated by a desire for political power on the part o fthe responsible directors.

The present writer is prepared to show that this "economy" program in 1925, to the beginning of September, resulted in the following: a larger expenditure on the payroll than during the same period in 1924; a lack of co-operation among employees; unfavorable publicity, detrimental to the best interests of the Valley; reduction of the capacity of

(Continued on Page 43)

Department Urges Upper Stream Appropriations on Western Waterways

All interests on the upper reaches of streams in the Western public land states have been urged to take advantage of local topographic conditions, secure their water rights and make early appropriations for storage and division of irrigation and power development in an official statement by the Interior Department. The statement declares:

"It is the policy of the Interior Department to encourage and even to urge the impounding of the water on the upper reaches of all streams in the arid and semi-arid regions of the United States. The precipitation of moisture in any region is fixed within approximate limits and can not be increased. Water must be used more than once to secure the greatest benefit from a given supply.

"The result of scientific meteorological observations and stream measurements demonstrate beyond argument that except for consumptive use in plant growth and by evaporation, no water is lost when used for irrigation and power development, but it later returns to the stream and may be repeatedly used before the final return flow reaches the stream at its outlet, but water first applied far down the stream is forever lost to use above the point of diversion. High diversions automaticaly simplify administration of water rights, which in the past have led to so many dissensions between neighbors, court-adjudication of rights, and litigations between States; interminable, costly, and delaying development of the West.

"If diverted first to the lower areas in the watershed its re-use will be curtailed and often lost forever for beneficial purposes. Irrigation in the upper reaches of a stream acts as ground storage, equates the seasonal run-off of the stream below, and can be again and again diverted or stored for irrigation or power purposes as far down as opportunities exist.

"The Department would urge *all interests in the upper reaches* of such streams to take advantage of topographic conditions, secure their rights, and make early appropriations for storage and diversion for irrigation or power development, to profit by the opportunities of the pioneer in time and place for their own advantage and ultimate benefit to those on the stream below them. While there is no Federal embargo on the use of streams in reclamation, the absence of agreements between States interested, operates as an economic embargo and prevents the preparation of adequate plans for development."

High Dam, All-American Canal, Have Support of Administration

SECRETARY Hubert Work has submitted to the senate committee on irrigation and reclamation a report in which he recommends a plan of development for the Colorado River similar in its essential phases to that contemplated by the Swing Johnson bill, now before Congress.

It is understood that the plan favored by Secretary Work is put forward after frequent conferences between President Coolidge, Secretary Hoover and other members of the cabinet, and that it therefore carries administration endorsement with it.

His report recommends that funds for the development should be provided by a bond issue by the United States, and should be sufficient to provide for the construction of a dam approximately 550 feet high, an adequate power plant, and an all-American canal. The total cost, which he estimates would be $125,000,000, would be divided as follows: construction of reservoir, $41,500,000; power plant, $31,000,000; all-American canal, $31,000,000; interest charges, $21,000,000.

Speaking of the Swing-Johnson proposal, which had been referred to him as Secretary of the Interior for study and report, he stated: "The general plan and purpose of this measure has my support, and I favor it being made a national undertaking, to be carried out and administered by the federal government."

TOUCHING the disposal of water and power by the government, the report says:

"The water so impounded should be sold to cities requiring it for domestic purposes and other municipal uses and to irrigation districts, like that of the Imperial Valley, desiring a complete or supplemental water supply under the provisions of the Warren Act, payment to be made for a definite volume of water each year.

"The electric energy generated should be sold to the highest bidders, with due regard to public interest, at the switchboard of the power plant. Contracts should not exceed 50 years in duration. Transmission of power and its distribution to be provided by the purchasers.

"Water supplied for domestic, industrial or irrigation uses should be delivered at the dam, at points along the river agreed upon and at the terminal of the All-American Canal.

"Prices for this water should be such as to at least repay all of the cost of operation and maintenance of the canals and an equitable part of the operating expenses of the dam. This with the revenue from power will, we believe, repay the entire investment in this development, with 4 per cent interest."

Referring to the All-American Canal feature, the Secretary believes that "the necessity for the All-American canal, and size and cost of this canal, depends largely on whether the existing concession under which water is now diverted from the Colorado River at Hanlon's Meading and carried through Mexico to irrigators in the Imperial Valley can be modified. If it can not be, then the All-American canal becomes an indispensable part of this development."

TWO important provisions are recommended by the Secretary's report bearing upon the relation of the proposed plan to the rights of the states under the Colorado River compact, as follows:

"Section 8, which provides for the distribution and use of all water for irrigation, power and otherwise, in accordance with the Colorado River compact, seems well conceived and is a necessary part of this legislation. This appears to afford ample protection and assurance to those states included in the upper division of the watershed against the creation of a priority of right through the building of these works, which would impair in any way their right to the volume of water guaranteed to that division in the compact. I suggest for consideration, amendment to the effect that the benefits to be derived from this development shall be available only to those states or the citizens of those states which have ratified the compact.

"I suggest the following proviso be inserted at the end of section 10 of the bill:

" 'Provided, however, that no work shall be begun and no monies expended on or in connection with the works or structures provided for in this act until the respective legislatures of at least six of the signatory mentioned in section 13 hereof, shall have approved the Colorado River compact mentioned in said section 13, and shall have consented to a waiver of the provision of the paragraph of article 11 of said compact, making the same binding and obligatory when it shall have been approved by the legislatures of each of the seven signatory states, and until the President, by public proclamation, shall have declared that the said compact has been approved by and become binding and obligatory upon at least six of the signatory states.' "

THE HYDRAULIC DIGEST

A Monthly Bulletin Board of Brief Facts and Events from Far and Near

Form New Idaho District

By a vote of well over the required two-thirds, voters of the lower Boise project lands in Idaho recently approved the proposal to form an irrigation district, to supplant the Payette-Boise Water Users' Association as the governing body for the Boise project. The vote was 906 to 310.

Vote to Dissolve District

By the margin of a single vote, the electors of the Salmon River (Idaho) Irrigation District have decided to dissolve the district. The district was formed two years ago for the purpose of issuing bonds to acquire the Salmon River project irrigation system, but nothing has been accomplished in this direction.

Vista System on Schedule

That the new irrigation system being constructed for the Vista Irrigation District, Southern California, will be completed on schedule time, and will be available for the 1926 irrigation season was reported to the directors at a recent meeting by Kenneth Q. Volk, chief engineer. The main canal is now more than ninety per cent complete.

Forming Montana District

Farmers in the vicinity of Hobson, Montana, are undertaking the formation of an irrigation district with the purpose of storing flood waters of the Judith River and Antelope Creek in the Acly lake region. The contemplated district would include 15,000 acres. Preliminary surveys have indicated that the plan is practical.

Power Development Urged

Engineers and executives of the Elephant Butte irrigation project are urging that a program for the development of power from stored waters of the project be undertaken and vigorously pushed. It is also proposed to construct a subsidiary storage dam at Las Palomas for the storage of water released by the big dam not needed for irrigation.

Purchases Melones Townsite

Twenty-seven acres on which the old historic town of Melones is built has been purchased by the Oakdale and South San Joaquin Irrigation districts. The town will be inundated when the Melones dam is completed. The directors of the two districts also jointly accepted the eight and one-half miles of railroad built by the Mathews Construction Company from the Sierra Railroad to the dam.

Reduce Service Charge

A flat charge of $1.00 to water users of the Imperial Irrigation District for each time water is ordered and delivered, established by the directors of the district as effective for 1926, has been reduced to a rate of twenty-five cents per day for the period during which water is run during the year. The change was made in the interest of small users who require only a limited amount of water, but at frequent intervals.

Drainage Congress Meets

The Fourteenth National Drainage Congress is meeting in January at Oklahoma City. A program of addresses and discussions by nationally prominent representatives of land reclamation, developing, financing, flood control, drainage and related problems will be enjoyed by several hundred delegates. Special attention will be given to the matter of land settlement. The congress will be in session for three days, beginning January 18.

District Plans Improvements

Improvements costing nearly $100,000 have been authorized by the Palo Verde (California) Irrigation District. The Union Iron Works of Los Angeles has received a contract providing for the erection of a steel shop building and warehouse for the district, and Caldwell & Richards have been given a contract for the renewal of a jog in the Colorado River at Ferry Bend. The district will spend $55,000 in widening and extending its canal system.

Reclamation Fund Grows

The federal Reclamation Fund was increased $180,217.32 through receipts from the sale of public lands including fees and commissions covering the third quarter of 1925. The largest receipts for the fund came from the State of Utah, the amount being $47,157.26. The second largest receipts were from Washington, with $23,113.75, while the third were from Wyoming, with $18,161.41.

Conservancy District Reduced

From more than a million acres, the area of the Middle Rio Grande Conservancy District will be reduced to about 400,000 acres, if a report submitted to its board of directors at the close of the year is accepted and acted upon. George M. Neel, state engineer of New Mexico, and two other prominent engineers of the state prepared the report recommending the exclusion of the largest part of the district as territory which they believed is non-reclaimable.

Complete Big Private Project

The American Beet Sugar Company, Oxnard, California, has completed its big private irrigation and drainage project in Ventura County. A year's work and an expenditure of half a million dollars are involved. Forty-five miles of drainage ditches, seventeen wells, varying from 350 to 1030 feet in depth, and other construction features in proportion, were includeded in the project, which will develop more than 2000 miner's inches to be used on the 7500 acres of A. B. S. holdings.

Final Step in Merced Work

Work has been begun on the final undertaking in the task which, completed, will bring water to 200,000 acres of the Merced (California) Irrigation District. Directors of the district have instructed their engineers to clean several miles of the main canal of the district and to provide for the enlargement of the tunnel, through which water from the Exchequer dam will be carried upon its completion. An expenditure of $200,000 has been authorized for this final step of the big job.

Washington Votes for State Aid In Settling Projects

Banker Bill Fails; Compromise Measure Opens Way for Approval of Kittitas Contract

After a vigorously contested fight in the Washington state legislature, during which the "Banker" bill (so-called from the name of its author) passed both houses but was vetoed by Governor Hartley, a compromise measure was enacted and received the governor's signature, paving the way for the execution of the contract between the state and federal government which insured the beginning of work on the Kittitas project.

The compromise law, which was passed as an emergency measure to take effect immediately, authorizes state co-operation in the settlement of projects, when the state is indemnified against loss by a contract with the individual irrigation district. As passed, the act is of a temporary nature, designed to secure immediate action on the Kittitas project. After June 1, 1926, special appropriations will be necessary for each district taking advantage of the bill.

The measure provides, in part:

"Section 1. That any irrigation district by and through its board of directors is hereby authorized and shall have the power to enter into a contract with the State of Washington whereby it shall agree to indemnify the State of Washington against any and all obligation and liabilities which may accrue against the State of Washington under any contract between the State of Washington and the United States relating to land settlement in said district.

"Sec. 2. Any such irigation district which shall have entered into any such contract of indemnity with the State of Washington is hereby empowered and shall be required to levy assessments against all the property within said district from time to time and in such amount as shall enable it to reasonably anticipate and promptly comply with its said contract with the State of Washington. Such assessments shall be levied and be payable at the time and in the manner that its regular assessments are made and shall have the same validity, force and effect as assessments for any other purposes. Such assessments shall be levied for and shall be paid into a fund, to be known as 'The Indemnity Fund, and such fund shall not be used for any purpose other than to fulfill its obligations under its indemnity contract with the State of Washington."

The bill makes it mandatory on the director of conservation and development to execute a contract on behalf of the state if agreed upon between the federal government and an irrigation district by June 30, 1926. After that date all reclamation contracts between the state and federal government must be approved by the legislature.

Mokelumne River Plan Under Fire From Manufacturers

The Mokelumne River project of the East Bay Municipal Utility District, (described in this issue by Arthur P. Davis) is being opposed by a faction in the East Bay region constituted as the Manufacturers Water Committee. The thirty-nine million dollar project was authorized by bonds voted more than a year ago, but the opponents of the plan are now urging a referendum. J. H. Millar is chairman of the Manufacturers' Committee.

Dr. George C. Pardee, president of the District, characterized as "laughable" the contentions of the faction opposing the carrying through of the scheme as outlined by Mr. Davis, whose consultants were such well-known engineers as George W. Goethals and William Mulholland.

"The East Bay Municipal Utility District directors are unanimously in favor of the Lancha Plana reservoir, and our confidence in the integrity and technical knowledge of the engineers who selected it is unbounded," declared Dr. Pardee.

Court Rules on Moot Point in Tulare District Case

Holds Judge Justified in Suspending Operation of Injunction Pending Appeal From Judgment

The Supreme Court of California recently decided an important point of irrigation law when it ruled, in deciding a point arising in the litigation between the Tulare Irrigation District and the Lindsay-Strathmore Irrigation District, that the Superior Court, in the exercise of sound discretion, is entitled to suspend the operation of an injunction to which it has determined that the plaintiff is entitled, pending an appeal from the judgment.

Superior Judge Albert Lee Stephens, before whom a re-trial of the case was heard, found for the plaintiffs, the Tulare Irrigation District, but, on motion of the defendants, suspended the operation of the injunction pending appeal. It was on this point that the case came to the Supreme Court, on an application for writ of prohibition, prayed for by the Tulare Irrigation District, to be directed against Judge Stephens and his court.

Action was commenced in July, 1916, by the Tulare District, which sought a permanent injunction against the defendant, restraining it from pumping water from a tract of land in Tulare County, to which the plaintiff claimed right. The trial of the case in the first instance resulted in a mis-trial, and on re-trial before Judge Stephens, the judge filed and signed his conclusions of law in favor of the plaintiffs, but before he entered his decree announced what his decision would be, and granted the motion of the defendant for a suspension of the operation of the decree pending appeal from judgment to the Supreme Court. The higher court concluded in its decision that the right of the judge in this case to supend the operation of the injunction was essential to the preservation of the right of appeal.

W. I. E. A. Meets in Los Angeles In Important Session

Two Business Meetings and Evening Banquet Included on Program for January 22

Beginning the new year with a meet that promises to be full of interest "from invocation to benediction," the Western Irrigation Equipment Association will hold its regular January meeting in Los Angeles, at the Hotel Alexandria, on January 22nd.

Two business sessions during the day, and a concluding banquet in the evening, are included on the program. The business sessions will be called to order, at the hotel, at 10:00 a. m., and 2:00 p. m. respectively, while the banquet will begin at 6:30. The morning meeting is for the executive committee only.

Some very important matters of business will come before the Association at this, the first meeting of the year, including consideration of the standard guarantee contract form, presented at the last meeting for the study of the organization and action at this session.

In a letter sent out by Secretary C. A. Utley, the entire membership is urged to set a new attendance standard at the January meeting by coming "one hundred per cent," with a knowledge of the matters before the association for action.

George W. Bigelow, of the Pacific Pump Works, Los Angeles, is chairman of the committee on arrangements for this meeting. B. A. Tucker, sales manager of the same company, will preside at the banquet as toastmaster. The principal speaker of the evening has not yet been announced, but will be a leader in irrigation development of the southwest, capable of speaking the language of the association, and will bring to the members a message of universal interest.

MANAGEMENT

WHAT ARE NEW MEXICO'S GREATEST IRRIGATION NEEDS?

By GEORGE M. NEEL*
State Engineer of New Mexico

MANY of the water uses of the State of New Mexico date back to the ancient Indian or early Spanish days. Naturally enough, these canals are simple diversions and were built with but one idea in mind, namely, to supply water to some one locality or settlement, and in no case was any attempt made to eliminate duplication of headings of canals.

The irrigation development in later years has, to a large extent from necessity, broken away from the earlier methods. These later developments are characterized by more expensive and more permanent construction, larger areas on which to saddle the cost of the works and an ever-increasing amount of storage to insure the water supplies.

Probably the greatest difference between the irrigation conditions in New Mexico and those of most other irrigation states is that here a large part of the normal low-water flow of its streams is covered by these simple and primitive canals, which seem almost sacred before our legislatures and our courts. Fundamentally they are entitled only to that water which they can use economically and beneficially. However, there is much room for accomplishment in the consolidation of duplicating features and a stricter administration in accordance with modern practice.

A CASE in point of what can be accomplished by reorganization and reconstruction is the Rio Grande Project of the Federal Government. Before its construction there existed in the valley now covered by it the old haphazard canals with no co-ordination and subject to the shortages of water in years of low run-off, while *now* all operations in the valley for one hundred and fifty miles are co-ordinated as one unit. As will be readily seen, these old canals have little value toward the reconstructed system except such water rights as they may have and the fact that the farms are to some degree going concerns and the settlement problem is partially eliminated.

The continued advancement of irrigation in New Mexico and gradual approach towards its limits because of the limited water supply, presents the increasing demand that future developments be based on comprehensive studies of stream systems as a whole. The science of irrigation has made notable strides in the last twenty-five years and seldom has the Irrigation Engineer with the present broadened conception, had the opportunity to plan the whole development of a stream system untouched by prior piecemeal development.

All new development must be approached from the broad and comprehensive viewpoint. Both capital and the success of a project now instituted demand that all the various phases be studied and alternative plans developed and final selections based on future as well as present conditions.

MOST of our larger streams are interstate in character and until the last few years development has proceeded on them with little thought of rights which are being initiated on the opposite side of a state line, and it has been the tendency to believe there was water available so long as there was an apparent surplus in the stream. We are awakening to the realization that what is taking place in our neighboring state on a stream which also furnishes us with water is our vital concern. From this has come the need of interstate understandings and recognitions.

Even the most ardent advocate of states rights in the matter of taking water which flows within its borders must admit there is a point, beyond which he cannot rightly go in appropriating to himself water which is the recognized supply of an old established community. In these matters a state's attitude may be unintentionally influenced by the fact that it is an upper or a lower user.

It is the writer's belief that New Mexico's greatest and most outstanding need for future ultimate and comprehensive development in irrigation can be stated under two heads:

First, a determination of all present rights, both inter and intra-state, and a fair allotment of any surplus waters on interstate streams as between the states involved.

Second, such changes in the state laws as will permit an individual user to expand his area irrigated without using a greater amount of water, thus encouraging a higher duty of water by giving to that individual the savings effected by himself.

** A paper presented to the December meeting of the Western Division of the Chamber of Commerce of the United States.*

Oregon Drainage Congress to Merge with Reclamationists

Two Organizations Join Forces for Advancement of Reclamation Activities of State.

The Oregon State Drainage Congress, meeting at Salem, Oregon, in December, voted to accept the invitation of the Oregon Reclamation Congress, extended at the time of the annual meeting of the latter organization, to merge with it and combine the identities and activities of the two bodies whose purposes are so closely allied.

Governor Pierce of Oregon was one of the principal speakers before the annual meeting. He emphasized the importance of drainage and irrigation as the future food producing factors of the nation, and discussed some of the major problems facing Oregon.

F. Lair Thompson, prominent Portland attorney, made a plea for the elimination of politics from irrigation development, and urged the appointment of a non-partisan committee to study the irrigation district problem of the state. He also advocated the expansion of the strictly agricultural activities of the Oregon Agricultural College.

21 PACIFIC PUMPS for CHOWCHILLA FARMS

THE United States Farm Lands Company of Chowchilla, California, has purchased twenty-one Pacific Pumps to be used in the irrigation of extensive ranch holdings in Madera County. Thorough and widespread investigation preceded this decision, and the order was given upon the unquestionably superior construction and efficiency of Pacific Pumps.

The Pacific Line embodies every factor found necessary in solving the pumping problems. Our organization of specialists will gladly give advice and assistance.

TWO FUNDAMENTALS—SEED BED AND SOIL MOISTURE

By HARDY W. CAMPBELL
Farm Advisor, Southern Pacific Company

THERE are two fundamentals in tillage that my thirty-five years of close observation and experiments have brought out as vital factors in the production of large crops of vegetables and grains—whether *with* irrigation or without.

Correct seed bed preparation is by far the most important problem in all successful crop growing today. In using the word "successful" I have in mind the production of a very material increase per acre over the present average yield, for it is the key to increased farm profits.

The careful preparation of the seed bed is the basis for bigger crops when correctly carried through; but it does not, as may be supposed, necessarily mean a material increase in cost of labor, because the kind of work done, time of doing the work, and soil moisture conditions, are of greater importance. It is a fact that much of the work and present methods are wrong and cannot produce the desired conditions for the big possible yields. Every farmer is proud of what he does well; consequently he will do twice as much with less fatigue. No farmer is proud of what he does not do well; therefore, he turns from it with disgust and imagines himself exceedingly tired. The work he has done comes to nothing for want of the real finish which may be only a little, but, if intelligently done, would not only have added faith, profit, courage and happiness to his farming efforts but would have lent an encouraging influence to his less hopeful neighbor.

AFTER the preparation of the seed-bed, the most vital factor is the ability to control and utilize the soil water to the highest degree of efficiency in the production of large yields. This depends very much upon the physical condition of the soil, brought about by the various acts of tillage. While conservation of soil water is important, remember its complete utilization is the big profit-maker. There is much evidence that there is a serious waste of soil water, both with and without irrigation, under the present more common practice. A thing that the average farmer does not understand is the immense value of timely tillage of the right kind.

It is the writer's candid opinion, supported by his more recent years of continued observation and experiments, both with and without irrigation, and over a wide scope of country, including a large variety of soils and climates, that the real condition of the seed-bed and the per cent of moisture it carries for several days prior to planting is the big governing factor. In other words, I am compelled to conclude that in all cultivated fields there is a certain important relation of the various soil particles, one to the other, from the very topmost down, that has been quite completely overlooked in the past. There is a certain precise arrangement of these particles that does regulate, very largely, that necessary combination of air and water in the soil. Certain soil conditions carrying (as they will where moisture is properly conserved) that high per cent of moisture with the desired low per cent of air lay the formation for the process—then, when the desired certain degree of warmth is added, there will follow in a very few days the development and growth of that most wonderful and valuable soil bacteria—nature's own fertilizer, or plant food—the real stimulating power behind the growth of all healthy plants. Therefore, the correct rearrangement, by timely tillage, of the soil parts will add to the soil's efficiency and increased producing power to a marvelous degree.

In short, as with the radio, the correct combination and adjustment of all parts brings the pleasing results.

HERE is the big point, to keep in mind, but expressed in a different way: If the seed-bed is put in a very fine, firm condition, early in the winter or as soon in the spring as frost and moisture conditions permit, and the soil just beneath carries the higher per cent of water, and a shallow dry mulch is quickly put and kept over the surface; then, as soon as the soil begins to warm up, nature's first and most important action in the growth of a big crop begins, in the way of increasing the available plant food. Not infrequently, quite early in the spring, although not perceptible to the naked eye, there will be millions of minute little plants growing in the upper or warmer part of the seed-bed, known as "soil bacteria." This is Nature's fertilizer, which does not have to be bought by the ton but is delivered, free of charge, if you proceed at the right time and in the correct manner in the preparation of the necessary favorable soil conditions for its development and growth. This procedure means much to garden and vegetable fields.

When Progress Came to the Peaceful Valley of Content

(*Continued from Page 19*)

tervals throughout by three-quarter inch steel rods, the apron walls being concreted over heavy wire meshing. During construction, ample provision was made—in anticipation of Willits' rapid growth—for raising the water line of the lake. This was done by extending the steel bars above the crest of the dam that proper bonding with the new and old levels of the reservoir could be accomplished.

ORIGINALLY designed on a 50-foot elevation basis, it has already become necessary to plan the addition of another 10 feet to this height, thus raising the water line, changing the contour of the lake and the topography of the surrounding watershed considerably. Various picturesque points and little peninsulas jutting out into the lake will become all or partially submerged, and there may be created even a miniature island or two.

Nor have the plans halted at the 10-foot addition contemplated for the immediate future. It has been estimated that the yearly run-off from the watershed surrounding the dam is in excess of 50,000 acre-feet. This fine surplus can and will be impounded for irrigation purposes for the valley and town of Willits, the dam being gradually raised to keep pace with the constant growth of supply and demand. If the dam eventually be raised to an ultimate 100-foot height, the storage capacity of the lake area will be more than 5,000 acre-feet; in other words, one and a half billion gallons of water will be available at all times.

Not only will the Mendocino valley derive water for irrigation from this structure, but the impounded waters of the Morris Dam insure a greatly improved fire protection, as well. This, in turn, reacts favorably on the reduction of insurance rates. A new 14-inch slip joint steel pipe line, with a capacity of 1,800 gallons per minute under 64 pounds pressure, connects the dam with its distribution mains. An ingenious

system of gates delivers water into the mains a little more than 100 feet from the main structure. All this is of cast iron pipe construction, and the reservoir drain and supply line feed are under gate control. Back-pressure gates in series take care of the flushing of the entire system whenever necessary. The main leads from the dam consist of 12-inch cast iron pipe, one located 10 feet from the bottom of the base wall, the other outlet being 15 feet from the top. These outlets lead to the gate house 108 feet from the dam, where control gates deliver water into the mains.

The construction of the Morris Dam has been notable for its economy—the natural lake setting, the narrow gorge at the lower end of the site, flanked by the ready-made walls of solid rock, the consistent slope of the land toward the mouth of the dam, and the fine sedimentary nature of the soil through which the pipes were laid from the dam to the town—all these features favoring the builders. Nor was this all—for they acquired franchise to give the right-of-way over roads, thus insuring even more economy in maintenance facilities, for the mains follow the road into Willits, and are thus always easy of access for repairs.

In carrying out the present design, less than 2,500 cubic yards of concrete will be required to raise the dam to 100 feet. This estimate is borne out by the fact that only 800 cubic yards of concrete were used in constructing the initial half-hundred feet, which, all in all, considering its huge storage capacity, makes the Morris Dam a distinctive achievement in water engineering in the West.

Imperial District Announces Budget Estimates for 1926

Estimated expenditures of the Imperial Irrigation District for 1926 will amount to $3,062,600, according to the budget announced by the general superintendent. The largest items are: water distribution, $1,237,350; bonded indebtedness, $1,042,000; real estate, building and equipment; $120,000; diversion, $238,000.

The superintendent's bulletin explains the plan for assessment in 1926 as follows: "Each acre of land pays an assessment at the rate of $5.00 per $100 valuation. For that assessment it receives all the water needed without any additional tolls, except the service charge. This service charge of 25 cents per gate per day water is delivered is required to pay for the zanjeros and hydrographers. It is levied on the theory that it costs the District just as much to operate the delivery boxes for a small flow of water as it does for a large flow."

You *Name the* Load
We *Make the* Pipe!

SINCE concrete pipe (as made by Bent) came into its own, engineers question no longer its striking advantages for a great variety of uses. *But*—a concrete pipe installation is either a mediocre or an eminently superior job of work, depending upon who fulfilled the contract.

Many trade names have become hall-marks of tradition, that serve as an unerring guide to discriminating buyers. Today the name "BENT" on a joint of Concrete Pipe marks it as a strictly finely made product. The same care and skill is exercised in its manufacture, and in the laying of the line, as though every future contract depended on *that* job meeting the fullest requirements of specifications—*and more.*

Let us give you a "concrete" demonstration of what we mean by "Bent" Service.

HYDRAULIC ENGINEERING

Dealing with the Practical Problems of the Operating and the Consulting Engineer

THE AGRICULTURAL ENGINEER'S PLACE IN RECLAMATION

By O. V. P. STOUT*

Division of Agricultural Engineering, Bureau of Public Roads, U. S. Department of Agriculture

I TAKE the term "Reclamation" to cover the process of bringing to a high grade of usefulness in crop production lands which at the inception of the undertaking are either in an unproductive state or are of inferior or limited capacity to produce.

This definition, if acceptable now, would have been equally so if proposed twenty-five years ago. The range covered by the definition would not, however, have been realized in the earlier period. The oprations now acknowledged to be embraced in reclamation are many more than were generally assigned to it at that time, and we have come to know that the process of reclamation does not terminate nor become assured of completion where and when we assumed that it did. We have had forced upon us the fact that it is not complete until the land has been subdued, in all that the term subdue implies, and brought to an advanced and complete state of cultivation and production; and not until there is on the land a full complement of adequate farm homes and well planned farmsteads, with the ownership on a secure financial and economic basis.

There are a multitude of different states or conditions in which land may be found or into which it may fall that offer a field for reclamation. It may be either permanently or at intervals or seasons too wet or too dry. It may be too strongly impregnated with mineral salts, or it may carry the refuse of industrial operations. It may lack elements of fertility which it is practicable to introduce and maintain. It may be covered with growths which impede or inhibit cultivation. The remedy in some cases calls for community or corporate action. In others there is opportunity for complete independent procedure within the scope of operations of the individual land owner. In nearly all instances, under all of them in this country, up to the present time, the ultimate steps to reclamation have depended on the owner or occupant of the land, acting in his individual capacity.

AGRICULTURAL engineering is the industrial branch of engineering which concerns itself with agricultural production. The economic purpose of reclamation is agricultural production. Therefore, we incline to assume at once that there is a field for the agricultural engineer and the American Society of Agricultural Engineers in reclamation. However, if we attempt to envisage their field as co-extensive with the engineering of reclamation we find some material overlaps, with some of the fundamental branches of engineering in position to assert claims of priority of occupation. The science and the art of the design, location and construction of works to water arid tracts of land have been developed almost entirely within civil engineering lines. Much of the progress in America has been accomplished within a comparatively recent period, so that whereas no longer than thirty years ago we had to turn to foreign countries for models of excellence and precedents of magnitude in irrigation engineering, we now find America able to show examples which are second to none. The record of these achievements and of the scientific considerations on which they are based and which have been developed in connection with them have been given attention in the papers and discussions at the meetings of the American Society of Civil Engineers and in publications.

Thus it seems that the case of priority of occupation of the field of irrigation works of magnitude is clearly established. If priority were all, however, and it could be shown that the agricultural engineers in sufficient number and with a training superior for the purpose would soon be available to render an even higher grade of service than that which has been noted, then the principle that "the first in time is the first in right" might not apply with sufficient force to prevent the agricultural engineers from moving to take over the field. There is nothing in the situation to give support to the idea of such a development, and I have to learn that it has been entertained. In the colleges the students n the professional agricultural engineering groups are given instruction in irrigation engineering, and there is no reason why with later experience of the right kind, some of them may not become engineers of large irrigation works.

But this is merely an aspect of the case as it applies to individuals. The group trained primarily as agricultural engineers is not that from which the supply of engineers for these larger works will be drawn, nor is the American Society of Agricultural Engineers the organization which, in the nature of things, is the logical one to assume the burden of future progress in the growth of the organized body of knowledge relating to the engineering of large works for reclamation by irrigation. Such being the case, it seems appropriate and desirable that any contributions which members of this Society may be able to make to this particular body of knowledge should be made through other channels, and that this Society should not invite nor encourage such contributions to its proceedings.

THE SITUATION in respect to other large works of reclamation, including drainage and flood control, is manifestly similar to that which obtains in connection with irrigation. That is to say: the province of the American Society of Agricultural Engineers does not extend to include the design and construction of the largest ways and structures. There is this, however, to be said, just as in irrigation, that in the decision as to capacity requirements of these larger works the qualified agricultural engineer will prove a most valuable consultant and in many cases the decision should rest with him. It fol-

lows therefore that the capacity requirements of reclamation works of whatever size or character is a subject within the field of this Society.

What, then, some may inquire, is left for agricultural engineering in reclamation? And is agricultural engineering to be awarded only the leavings and the smaller items of reclamation engineering? In a way this is the fact. But a little consideration will show that this fact gives neither the agricultural engineering profession nor the American Society of Agricultural Engineers the least occasion for despair nor to be ashamed. The main canals and distributaries, dams and diversion works, tunnels, flumes, U-tubes, wasteways, checks, regulators and all principal ways and structures will be of no avail in the accomplishment of the reclamation of the region or tract for which they have been constructed until the supplementary ways and structures have been provided, the unfavorable topographic features of the land surface to be irrigated have been altered to conform to the requirements for best results in the application of the water, and from amongst the multiplicity of existing and conceivable farm systems of irrigation one or another has been selected and installed on each farm or group of farms.

ALL OF THESE, together with the location and construction of community roads, farm water supply and farm sanitation, the layout of fields, farmsteads and centers, and the design of farm buildings, are matters calling for engineering service and direction in order that the best results from the standpoint of efficiency and economy may ensue in a finished project of reclamation by irrigation. Nevertheless, up to this time the mark of the engineer is missing from the most of them.

The tenor of present day discussion seems to warrant the expectation that there will be an immediate and continuing improvement in this respect. Such being the case, there opens up for the agricultural engineer and for his national society a field which, at the same time that it is largely made up of items which in comparison with items of the larger works may seem minor or petty, in the aggregate covers a range and forms a magnitude that can be expressed only in terms which are the complete antitheses of "minor" and "petty." Moreover, this field, due to neglect in the past to attach full importance to it as a theater of engineering endeavor, presents now, and for some time to come, more of an opportunity for the effective work of an engineering society than does the rounding out of the already advanced practice in large works.

Inasmuch as it has been shown to be important that the work of the agricultural engineer should attach to the finishing of an irrigation project, it follows that he should be on the ground at the inception of the project also, in order that he may assist in arriving at the judgment which should be formed at that time as to the practicability of completing, in due season, the entire process of reclamation. In this it will devolve on him to ascertain and interpret all of the facts and factors of the situation which have or may have a bearing on the feasibility of an economic agricultural utilization of the land. It becomes accordingly the part of the American Society of Agricultural Engineers to take the lead and direction in building up and making available an organized body of knowledge covering the subject of the agricultural feasibility of reclamation enterprises.

The operation and maintenance of an irrigation system presents problems equally as complicated and frequently approximating the same order of magnitude as those which attach to the planning and construction of the system in the first place. To a great extent they are of a nature which may with propriety be considered by the American Society of Agricultural Engineers and without danger of meeting resentment on the score of priority of another society in this detail of the field.

A consideration of the fields of reclamation by drainage and by flood control would develop a demarcation closely analogous to that which has been indicated for irrigation.

WHERE the primary operations of reclamation consist solely of those directed to the subduing of the land, and where this can be accomplished on adjacent small areas independently of each other, it does not appear that any priority of engineering occupation is encountered by the agricultural engineer or the American Society of Agricultural Engineers. The assignment of the engineering of reclamation of cut over lands, for instance, is therefore made without reservation to agricultural engineering.

Engineers have had a large part in the valuation of the properties of public utilities and the establishment of rates for service. Some of the most effective studies of these subjects have been made by engineers. Their analyses and conclusions appear in the publications of engineering societies, where it can be shown that many, in fact a considerable majority, of the principles which have become embodied in court decisions and in the rulings of regulatory bodies and which now govern in such matters were first conceived and formulated by engineers.

The assignment of the engineer to this work was at first due to his familiarity with its physical basis, but he has carried it forward to less tangible elements on the basis of his training and practice in analysis. There are already strong indications that engineers will play an equally important part in the development and formulation of the financial and economic principles which are to guide in the settlement of lands as a directed step in reclamation. As in the case of utility valuation, the proceedings of his national engineering society is the best place for the record and appraisal of his achievements in this line. The treatment of these financial and economic questions, together with a study and working out of appurtenant sociological problems, constitutes a field which, it seems, must be looked upon as wide open to any who can contribute anything of benefit, be they engineers of whatever branch or not engineers at all.

IN THE foregoing paragraphs the partition of the civil engineering phase of reclamation between civil and agricultural engineering has been foremost in mind, and the mechanical and electrical engineering phases have been passed over. The principal field of the largest pumps is in reclamation. The design of a pump as a whole, of whatever size or capacity, scarcely falls to the agricultural engineer, but the testing and study of these designs is within his province. There are features of design which agricultural engineers, on behalf of the users of pumps, are investigating and seeking to improve. The situation is much the same in regard to the farm tractor. It may be noted that although the tractor is by no means exclusively an instrument of reclamation it has extensive use in that connection and a leading type was first developed in connection with reclamation. The fact that the agricultural engineer is already identified with tractor development in general may have a bearing on this item. The construction and maintenance of small irrigation distributaries and drainage channels, farm ditches for both irrigation and drainage, and devices for the installation and maintenance of various types of farm irrigation and drainage systems call for specially designed machinery. It may well be that the agricultural engineer, as the user of these machines, is well qualified in many instances to originate or improve the design.

From these considerations it appears that the agricultural engineer is involved in the mechanical engineering phase of reclamation in such a way as to obligate this Society to keep open its proceedings to the treatment and discussion of me-

chanical engineering subjects such as these enumerated.

In connection with the electrical engineering phase of reclamation, the agricultural engineer will sèrve chiefly, although not exclusively, as a consultant to the consumer of electricity, advising him as to types and disposition of machines and distribution of load thereon, to the end of securing the maximum practicable efficiency in performance and the most economic adaptation to rate schedules. This justifies the Society in holding within its scope the comprehensive and detailed consideration of farm plants, and probably all but the largest plants using electric power for reclamation purposes.

Making Irrigation District Credit What It Ought to Be

(Continued from Page 18)

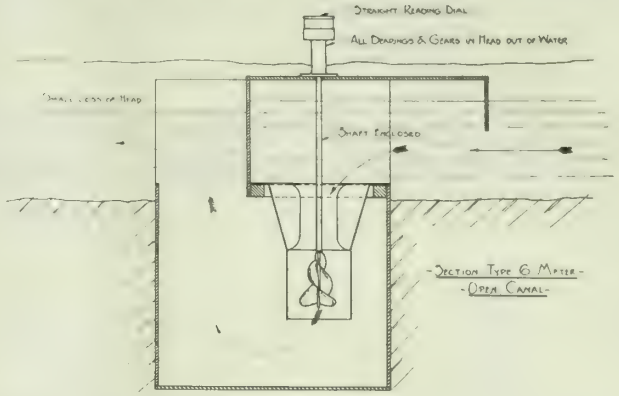
The state of Nebraska recently enacted a law which provides that an irrigation district may "fund" its warrants, notes or other indebtedness into a bond issue. This law also provides for refunding twenty-year bonds into bonds running not to exceed fifty years. It further provides that interest coupons shall automatically bear interest at the same rate as the bond, if not paid when due.

The funding feature is important for districts which have allowed a considerable amount of taxes to remain unpaid, resulting in warrants not being paid for two or three years. By adopting the funding plan the district is enabled to place itself on a cash basis, and if the savings in interest and discounts are taken into account it is certain that a greater effort would be made, on the part of irrigation district officials, to keep on a cash basis. However, if anything is to be gained by funding warrants and other indebtedness a definite system for the collection of taxes must be inaugurated. Otherwise the district may, in a few years, be again in arrears in the payment of its warrants.

It would be well for irrigation projects to adopt a slogan similar to the following: *This project has never defaulted in the payment of its obligations —no investor has ever lost by the purchase of our securities.* Such a slogan would become more valuable with the passing years. The securities of such project would become salable anywhere in the United States and would be on a par with other first-class securities.

There is no question but that such a condition can be realized if the landowners and officers of irrigation projects will definitely plan to establish and maintain credit for their projects.

THE **RELIANCE** METER



THE RELIANCE IRRIGATION METER has been the standard low pressure Meter for 10 years—thousands installed throughout the irrigated sections of the West. Built in various types and sizes to fit all deliveries on canal and pipe systems. Easy to install—easy to read. Straight reading cubic foot or acre foot dials. Simple in construction, few and slow moving parts—upkeep negligible. No bearings or gears under water—small loss of head. Unaffected by dirt and floating debris in water. There is a size and type to settle your measurement problem.

MARTIN
PORTABLE HYDRANT

The Martin Portable Hydrant is further example of products conceived and perfected by irrigation specialists. Thru its use with Martin Alfalfa Valves Type B and Type Q, four checks can easily be irrigated and the direction of flow controlled.

The spout of the hydrant can be turned in any direction. Two hydrants are generally used on one pipe line. While one is set and operating, the other can be moved to the next valve. Surface pipe can be attached to hydrant before the valve is opened. The valve is opened and closed by the wrench built into the hydrant.

We manufacture the original line of Irrigation Appliances Outlet Valves and Cut-off Gates for the definite division of water over the field from Concrete Pipe Lines

WITH THE WATER COMPANIES

Of Interest Expressly to Water Works Engineers, Superintendents and General Managers

HOW THE RAILROAD COMMISSION HANDLES COMPLAINTS

By M. R. MacKALL

Hydraulic Engineer of the California State Railroad Commission

PUBLIC UTILITY water companies come in contact with the Hydraulic Division of the Railroad Commission most often through its informal complaint department. This department was organized by the Commission as a result of its general policy to promote a better understanding between the individual companies and consumers and to promote a spirit of cooperation in the general relations of utilities with their customers. While, in general, the Commission must make a formal order before it can legally demand and require compliance with its suggestions and instructions, yet there are so many matters that can be as readily solved informally, without the delay and expense attendant upon formal proceedings, that the Commission endeavors whenever possible to settle all complaints in this manner by correspondence between the parties or by personal investigation when the facts demand it.

During the last fiscal year the Commission settled informally 784 complaints as compared with the rendering of decisions during the same period in 179 formal proceedings requiring public hearings. The informal complaint department has developed into a branch of great importance not only as to economy in saving time and money for both utility and consumer, but also by speeding up of final settlement of complaints which otherwise would require formal action and decision by the Commission.

OF THE complaints filed with the Commission approximately 40 per cent involve disputed bills, 30 per cent inadequate or interrupted service, 20 per cent service installations and extensions of existing mains for service. The remaining 10 per cent cover complaints against the reasonableness of the rates or the classification charged, refunds under deposits, unjust rules and regulations, and the multitude of other causes which only a water works man can believe possible, including many that he honestly believes impossible as well.

It is a pleasure to be able to state that the complaints coming to the Commission are changing very definitely in character. There is a decided lessening from year to year in the number of trival compaints coming to the attention of the Commission. Only the more involved and complicated matters are now being referred to the Commission for settlement. This simply means that the water companies have generally adopted the broadminded attitude that good business demands every effort to meet the public fairly and honestly, and that the establishment of a good feeling with the customer through an earnest effort to settle disputes and complaints pays more than one hundred per cent upon the investment, in spite of the monopolistic nature of the business.

As a matter of fact this is well illustrated by the fact that the Commission will receive more complaints against some utility serving a community of perhaps two to five thousand in population than it will receive against the companies serving cities of over half a million population. In most cases this is due to the personal element rather than to service matters. The reason, of course, is obvious; the larger the utility, the greater is the realization that special efforts devoted to its public relations result in removing friction and reducing operating costs. The larger utilities have all found that special departments organized for the handling of this phase of their business is an absolute necessity.

ONE OF the greatest causes of difficulty experienced by the Commission in dealing with complaints is that involving the class of water systems installed by real estate operators to make possible the sale of lots. It is almost the universal practice for these operators to use the cheapest type of materials, adopting quite novel theories of construction, with inadequate sized pipe and usually with little or no storage facilities.

The difficulty arises in such cases when the cream of the lots is disposed of and the water system becomes a burden. Usually the water supply is inadequate, the service is almost unbearable, and the rates, already insufficient to pay a fair return upon the investment, can not be increased, for in most cases the charges are already all that the traffic will bear. The consumers of a public utility are entitled to continuous and reasonable service at a just price. The utility is entitled to a rate which will yield a fair return upon its investment. The Commission can not force any utility to operate its water system at a loss; to do so violates the 14th amendment to the Federal Constitution, which forbids confiscation of private property without due process of the law. This is a problem that is not only not rare but is a common every-day occurrence.

The solution of this particular problem is apparent to me in only one way, and that is to require the proper type of installation at the outset. Under existing laws this cannot be done. The counties and cities may grant a franchise to a company to construct a water system in the public highways, after which the company applies to the Commission for a public utility certificate. The cities and counties have no authority to demand certain standards of installation and service facilities. As a matter of fact the entire necessity for the procurement of a franchise is easily avoided by installing the water system before the subdivision is accepted by the authorities and the streets dedicated to the public use.

As to the withholding of a certificate to operate by the Commission for improper standards of installation, no such authority is apparent in the Public Utilities Act. The Commission itself is, necessarily, the greatest offender in this regard, for a majority of those applying for certificates for the operation of a water system have already been supplying a considerable number of consumers, in some instances for several years. To deny the certificate under these circumstances means that the existing consumers in 99 cases out of a hundred will be left

entirely without water service from any source whatsoever.

MATTERS of grave concern to the Commission as well as the water companies are those arising out of demands for service from an existing utility which require the extension of mains or other facilities. This is most acute in cases involving real estate subdivisions. In cases of ordinary extensions to individual consumers the Commission generally requires a water system to extend its mains at its own expense 150 feet for each bona fide consumer, the excess cost to be paid by the applicant, which is to be refunded to him in various ways when new consumers come on the line within a certain definite time limit. The fairest method of extension would perhaps be to expend a certain definite amount of money for each consumer. However, the varying conditions and the complications arising from keeping track of the costs, make this impractical. The 150-foot rule is the most simple and satisfactory in the end. The time limit for refunds, by the way, is of great importance. A period of not to exceed ten years appears to be fair to all parties.

Fortier, Adams and Etcheverry Are Advisors to Magazine

(Continued from Page 13)

number of smaller groups, including an irrigation section, of which he was chairman for a number of years. He also has membership in the following scientific and technical organizations: American Association for the Advancement of Science, California Academy of Sciences, American Society of Civil Engineers, and American Society of Agricultural Engineers. He is at present chairman of the Pacific Coast Section of the last named society.

B. A. Etcheverry

B. A. ETCHEVERRY is equally well-known for his activities in both the academic and practical fields of irrigation. He has been identified with one or another state university in the West since 1902, first in the departments of civil engineering and physics, successively as assistant and associate professor of irrigation, and finally as professor of irrigation engineering, which position he now holds at the University of California.

As an irrigation expert he has conducted some very important investigations for various irrigation interests, including an investigation on canal and reservoir linings and the use of concrete in irrigation structures, for the United States Department of Agriculture in 1906-1909; a report on irrigation conditions in British Columbia for the provincial government, 1912; an investigation for the city attorney of San Francisco on the use of the water of the Tuolumne River by the Modesto and Turlock Irrigation Districts, 1914-1922; an investigation of the use of the water of the Kaweah River, for the Lindsay-Strathmore Irrigation District, 1921-1924; on the use of the water of the San Joaquin River, for the Madera Irrigation District, 1921-1922; and a large number of reports on proposed irrigation and drainage systems, design for diversion dams and irrigation structures, plans for distribution systems, and many other miscellaneous investigations and studies.

He has served as consulting and supervising engineer for the Kamloops Fruitlands Irrigation and Power Company, British Columbia; and in a consulting capacity for many irrigation organizations, including the Yolo Water and Power Company in the planning of improvements costing $350,000 and the appraisal of its irrigation system. In 1915 he was made chairman of the board of review for the adjustment of the construction charge of the Umatilla, Truckee-Carson, Klamath and Orland projects of the United States Reclamation Service. He has served as commissioner of assessments of several important western drainage and reclamation districts, and as member of a large number of official and semi-official bodies interested in the conservation and development of western water resources. He is author of a standard work, in three volumes, on "Irrigation Practice and Engineering."

Would Issue $700,000 Bonds

The Monterey County Water Works has applied to the California State Railroad Commission for permission to issue $700,000 of first mortgage 6 per cent bonds, at 94 per cent of face value, and to use the proceeds thereof to reimburse Del Monte Properties Company in the sum of $328,043 for the acquirement of said properties used by the water system and to provide itself with working capital and to reimburse its treasury for capital expenditures.

Big Crop Return on Rio Grande

The total gross yield of crops during the past year on the Rio Grande reclamation project in New Mexico and Texas including lands irrigated in the republic of Mexico totalled $12,605,000. The Elephant Butte and El Paso districts produced crops last year valued at $10,680,000. This is an increase of approximately $1,000,000 over crop returns of the previous year in spite of a $500,000 crop loss due to floods along the Rio Grande.

WHO'S *WHO* AND WHO'S *WHERE*

IN THE WORLD OF HYDRAULICS

Personal Notes and Impersonal Observations About Men You Know

John W. Scott, formerly connected with the U. S. Land Office in the Imperial Valley, has returned to the valley and will be employed in the office of the Imperial Irrigation District, at El Centro.

B. W. Oppenheim of Boise, Idaho, has been engaged by the directors of the Warmsprings (Oregon) Irrigation District for consultation in seeking a plan and directing the work of the district in adjusting its financial difficulties.

R. B. Coglon, County Agent in Yuma County, Arizona, has resigned to accept a position in the Missouri extension service. J. P. Sexton, Jr., has been appointed County Agent in Santa Cruz County, Arizona, succeeding Lee H. Gould, resigned.

Earl C. Pound and Charles L. Childers, president and attorney, respectively, of the Imperial Irrigation District, have returned from Washington, D. C., where they have been observing legislative developments in connection with the Swing-Johnson bill.

Professor H. A. Wadsworth, of the Division of Rural Institutions, College of Agriculture, University of California, was a visitor in Southern California during January, completing the extensive studies on which he has been engaged for the past several months on the subject of overhead irrigation.

Hardy W. Campbell, farm advisor for the Southern Pacific Railway, is making a tour of New Mexico and Arizona, delivering a series of lectures on the utility of water. Mr. Campbell is a specialist in soils culture who has spent a life-time in close contact with agriculture in all sections of the west.

D. R. Redman, resident engineer of the U. S. Indian Irrigation Service on the Wapato project, will undertake on February 15 a tour of California, Oregon and Arizona, in an effort to increase his familiarity with the latest type of hydro-electric developments on irrigation projects in these states. He will probably spend about six weeks en route.

H. P. Pratt, of Seattle, accompanied by several other northwesterners concerned in irrigation finance, recently inspected the Attalia (Washington) Irrigation Distrct, conferring with the board of directors on its financial outlook. The committee represented the bondholders of the district, who are interested in devising some method of relieving pressing financial problems.

Francis Cuttle, of Riverside, California, prominent in work for conservation and forest protection in the west, is in Washington, D. C., in the interest of pending forestry legislation. He testified before the senate agricultural committee that the conservation of water, which the passage of the pending forest bill would materially assist, was an issue of paramount importance to Southern California.

C. H. Pease, secretary of the Lower Rio Grande Water Users' Association, and editor of GRAVITY IRRIGATION NEWS, official publication of the association, is spending the winter in California, making a study of the irrigation situation in the far west. In January he was in conference with officials of the Imperial Irrigation District, discussing problems of international interests in the Colorado River. He is interested in this subject on account of the problems of the same sort which exist on the Rio Grande.

Arthur S. Bent, of Bent Brothers, nationally recognized leader in the construction industry, has been elected president of the Los Angeles Chamber of Commerce for 1926, succeeding R. W. Pridham. Mr. Bent's election adds another to the already impressive list of official positions which he has held in influential organizations. He is a past president of the Associated General Contractors of America, and was the first president of the Southern California chapter of that body. He is also a national director of the Chamber of Commerce of the United States.

Officials of four states and a representative of the federal government met in December at Seattle, Washington, for a conference on a possible plan for allocating waters of the Columbia River between the states. Those participating in the meeting included: R. K. Tiffany, state hydraulic supervisor of Washington; C. S. Heidle, state engineer of Montana; Rhea Luper, state engineer of Oregon; W. G. Swendsen, reclamation commissioner of Idaho; Col. W. J. Barden of Seattle; R. F. Coiner of Portland, and J. L. Lytel, project manager of the Yakima project of the Bureau of Reclamation.

District elections of directors of irrigation and drainage districts of Washington were held during December, resulting in the naming of the following in their respective districts:

Okanagan, R. C. Rasmussen; Alta Vista, Leonard Rich; West Okanagan Valley, F. E. Teas; Whitestone, William Forde, R. A. Nixon and H. M. Hall; Riverside, George Hasbrouck, Philip Pfarr and Thomas Bailey; Richland, William Hellinger.

Sunnyside Valley, E. C. Houston and R. J. Core; Snipes Mountain, A. B. Delp; Kennewick, J. W. Vickers; Columbia, James Johnston; Burley, Joseph Morgan and Haven Leigh; Attalia, J. J. Cummings; Terrace Heights, H. S. Hauses and W. W. Drake; Wenas, J. B. Fink, Guy Longmire, and R. C. Babbitt.

Naches-Selah, John Dollebacher; Selah-Moxee, J. D. MacAuley; Moxee Drainage District, Edward Regimbal; Greater Wenatchee, Fred W. Hoffman; Wenatchee Reclamation District, William Greig; Millerdale, V. L. Garner, Marvin Chase, J. B. Daugherty.

Horse Heaven, Claude Young; Broadway, George Grist; Fruitvale Drainage District, J. Howard Wright; District No. 42, George L. Hunt; Lewiston Orchards, W. S. Thornber, P. E. Bishop.

Paul S. Redington Becomes Assistant Forester

Promoted to Washington Post After Score of Years in California Forestry.

Paul G. Redington, chief of the California district, United States Forest Service, has been promoted to assistant forester with headquarters in Washington, D. C. Mr. Redington will be head of the branch of public relations of the Forest Service which includes all co-operative work carried on under the terms of the Clarke-McNary Act, passed by Congress last year, providing for co-operation with states in fire protection, reforestation, a study of taxation and other important national forestry problems. Twenty-nine states are already co-operating with the Federal Forest Service in this work.

Mr. Redington, who is a graduate of Dartmouth and the Yale Forest School, first entered Federal forestry work in California in 1903. From 1911 to 1916 he was supervisor of the Sierra National Forest from which position he was promoted to district forester of the Southwestern District with headquarters at Albuquerque, New Mexico. In 1919 he returned to California as chief of the 18 national forests of that state, which position he has held to date.

He is vice-president of the Society of American Foresters; president of the San Francisco Departmental Club of the United States Department of Agriculture; chairman of the forestry and wild life section of the Commonwealth Club; an advisory member of the Southern California Conservation Association; the American Reforestation Association, the forest policy committee of the California Development Association, and the Commercial Club of San Francisco.

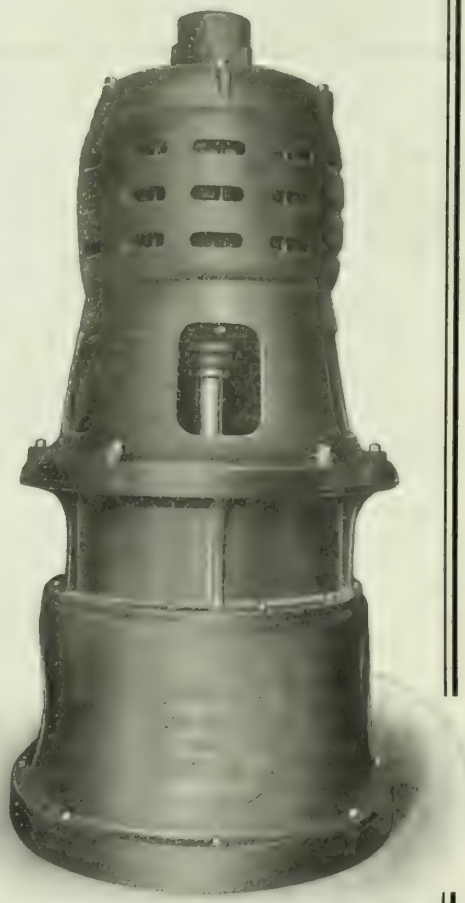
Mr. Redington will leave in the near future to assume his new duties. His successor in the California district has not yet been named.

Yolo Company in Straits

Unsatisfactory financial conditions of the Yolo Water and Power Company, as revealed in the hearing of a suit to foreclose a mortgage lien against it, resulted in December in the appointment of a receiver to take charge of the company's affairs. Suit was brought by the Oakland Bank to foreclose a mortgage lien against the company based on $9,900,000 in bonds and more than three million dollars in unpaid interest. G. H. Hoppin was named receiver to operate the business of the company pending its sale to the highest bidder on the open market. Judge M. S. Sayre, sitting in the Superior Court at Lakeport, heard the case and named the receiver.

ABILITY

ABILITY to perform faultlessly under all conditions--ability to deliver satisfaction--ability to withstand the rigors of years of hard usage. You find all these qualities in PEERLESS PUMPS, efficiently serving the small rancher as well as municipalities, at the least possible maintenance.



Made for 7-in. wells or larger. Capacity 180 to 3000 gallons per minute. Peerless advisory service is at your command. Write for our latest catalog.

Peerless Pump Company

1916 E. Sixty-Seventh St DElaware 0986 Los Angeles, California

DIGGING—CLEANING CANALS
AT LOW COST

THE NEW RUTH WITH ITS CONTINUOUS FLOW OF DIRT will dig or clean canals and trenches at a minimum cost per cubic yard or lineal foot heretofore considered impossible. The Ruth cuts continuous, even banks and smooth bottoms. Working successfully in marshy or dry ground, or canals full of water. The Ruth positively cleans the canal of all muck, sand, small willows, tules and water grasses.

Send for Bulletin No. 8—it illustrates the New Ruth Dredger; type and size of canals it will dig or clean; gives specifications, operating costs and maximum capacities.

RECLAMATION

NATIONAL MAGAZINE ANALYZES RECLAMATION TROUBLES*

AT THE ROOT of the reclamation difficulties which have assumed the proportions of a national problem is the traditional acceptance of Uncle Sam as a beneficent Santa Claus, believes French Strother, Associate Editor of WORLD'S WORK, writing in the January issue of that magazine under the heading: "The End of Uncle Sam as Santa Claus: Why Secretary Work is in Trouble with the West Over Reclamation."

Recapitulating the history of the development of the American continent, Strother points out that the role played by the federal government, from its inception to the present day, has been that of a generous and open-handed giver of free lands and other emoluments; and that the west has been the recipient of most of these benefits. It was not strange, therefore, that the policies of national reclamation should have been at first mistaken by their beneficiaries as another indication of federal munificence. But, avers this writer, reclamation was not intended merely as a channel for outpouring money in the interests of whomsoever might desire it, and when the rude but inevitable awakening occurred, the trouble began.

Mr. Strother briefly reviews the history of reclamation, as follows:

"IN 1902, Congress passed the Reclamation Act, popularly known at the time as the Newlands Act, from the name of the Nevada Senator who wrote it. Theodore Roosevelt was President, and the West was much in the public mind as a result of his vigorous advocacy of conservation. The reclamation of arid lands appealed to the popular imagination as a truly American conception, of wresting from nature another of her guarded treasures and, by enterprise, engineering skill, and vast expenditure, to make the desert blossom as the rose. The traditional land buyer of westward pioneering America also lent a sentimental interest to the plan. 'Free land' was becoming scarce, and the government at Washington (ever the giver of gifts) was about to make more free land to order.

"With characteristic American speed, four projects were authorized within a year after the passage of the act, seven more the following year, and nine the year after—so that, within three years, work was under way on twenty projects, involving an expenditure of $150,000,000. This gigantic enterprise was undertaken with no previous experience to guide the government. The work was regarded as chiefly an engineering enterprise, and no doubts were entertained regarding the skill of American engineers. This confidence was justified, for the immense dams of concrete that impound the irrigation waters of these projects are among the most monumental of the works of man, and promise to endure as the pyramids, and to the greater glory of their creators.

"But (it soon became apparent) engineering was the least of the problems involved in reclamation. The physical works were only magnified examples of the application of known formulas and practices. The reclamation idea assumed that an equally simple formula could be applied to the settlement and development of the projects. This formula was, that 'land *plus* water *plus* settlers *equals* a successful reclamation project.' This formula—so time has proved—is not correct. It can be made correct only by adding numerous qualifying adjectives to the nouns—thus:

" 'Good land, cleared, leveled, broken up, artificially drained, and planted to the right crops, *plus* water *plus* settlers with adequate capital, previous practical farming experience, high character, good brains, exceptional energy, and a knack for co-operation with their neighbors *equals* a successful reclamation project.'

"Twenty-three years of experience with reclamation has taught the Federal Government how rarely this combination of elements can be got together. Only three of the twenty-seven projects now completed are satisfactorily successful in all respects.

"The rosy side of the reclamation picture can be briefly painted, as it is in a government report, as follows: 'The twenty-five irrigation projects, the development of which has advanced to the stage of *producing crops*, comprise some 34,000 farms and a cropped area of approximately 1,175,000 acres, and produce annually crops having a gross value of more than $50,000,000. This is practically equivalent to the agricultural situation in the State of Massachusetts'—both as to number of farms and as to value of crops. The reclamation enterprise may truthfully be said, therefore, to have 'added another state to the Union.' "

"THE darker side of the reclamation picture is more extensive," says the writer, and he goes on to enumerate the unexpected problems which have proved so troublesome on the reclamation projects, and with which most irrigationists have become only too familiar.

The first cloud on the projects was the unduly optimistic publicity broadcasted regarding the project lands. It was wrongly assumed by the whole country, says Mr. Strother, that all the land on all the projects was first class land, ready for the plow and the seed. When disillusionment came, with results well known to irrigationists, the result was "that many settlers were defeated before they started, and have ever since nursed a natural resentment against the government for what they feel was a fraudulent misrepresentation of the lands they bought."

THE need for drainage, the price of land, which, with construction costs added, was much more expensive than had been believed by the settlers that had rushed to take it; the erroneous impression that all the project land was government land, when much of it was not; all these added to the grief of the service and the troubles of the settlers.

"The settlers early came to Congress with their troubles. The Reclamation Act, as originally passed, provided that every settler should pay his share of the construction cost of the irrigation works in ten annual installments. For the reasons given above, thousands of the settlers had spent more than they had expected to spend, and had no money to pay the installments. So general was this situation, and so numerous were the just claims of settlers to consideration, that Congress doubled the period of payment, extending it to twenty years. This, the so-called Extension Act, was passed in 1914. It was more than an extension agreement—it was a refunding operation as well. Settlers not only got more time to pay their per-acre share of the cost of the permanent irrigation works, but they were allowed to add their arrears on the yearly charges for water-service to this capital account, spreading the whole over a long period and without any interest charges.

"This was the first of the 'relief' measures for the benefit of the settlers. Twice since that time, Congress has been appealed to for further relief, and granted it—in 1922 and 1923—in the form of acts permitting the Secretary of the Interior to defer collection of payments then due.

"The theory of abstract justice underlying these leniency measures was that the government had made a mistake in its original plan of payment, when it assumed that all settlers could pay out in the same number of years. This assumption presupposed another, name-

*Quotations from material copyrighted by the publishers of WORLD'S WORK are made by special permission of the magazine.

Many County Commissions are Northwest users. Their speed and versatility make them an ideal machine for all classes of work.

Greater capacity—Greater speed!

A 1-YARD bucket on a 45 foot boom gives the Northwest a reach and capacity unequalled by any other machine of its size. Add to this the "feather-touch" clutch control and three-lever-operation, freedom from many hard operating levers and pedals. Consider that through the "feather-touch" clutch control the power of the engine shifts the clutches, yet retains the feel of the bucket and you have the big reasons why Northwests are the choice of the big drainage and irrigation contractors.

—and due to the Northwest patented crawler base, it's the most mobile dragline on the market.

ly, that all the lands they bought were equally good—which, of course, was not true. To that extent, and for a good many other reasons suggested above, justice favored the settlers as a whole.

"RECENT investigation, however, has shown that justice cannot be administered wholesale. Some settlers on some projects have kept up their payments punctually, through good seasons and bad, and often at severe sacrifice of comfort and future prospects. On the other hand, other settlers on the same projects, with better land and more financial resources, have purposely let their payments go by, trusting to just such blanket 'relief' from a tender Congress to give them years longer to pay. . . . . .

"The 'leniency laws' offered no permanent solution of these complex problems. They simply postponed them. Demands for further 'relief' being pressing, the Secretary of the Interior, Dr. Work, two years ago appointed a Fact Finding Committee to investigate the whole reclamation situation and to recommend a permanent solution. In April, 1924, the committee reported. Congress enacted some of its recommendations. Recognizing that wholesale relief was inequitable, Congress authorized the Secretary of the Interior to decide each individual case on its merits, to extend the time of payment where justice required, and to demand immediate payment where the settler was able to pay.

"Then the trouble began. In the spring of 1925, Director Mead, with the backing of the Secretary, 'notified settlers that hereafter relief, when extended, would be to individuals; and to them only after a showing that the delinquency was due to obstacles they were unable to overcome. That notice has caused the bureau to lead a strenuous life. Applications for individual relief came in this year by the thousands. They had to be examined and reported on in the field, and then scrutinized in the Washington office. . . ,

"The uproar attendant upon this unfamiliar process of collecting money due the government filled the newspapers of the country last spring and summer with the anguished cries of Western settlers and Western Senators. Demands were made that President Coolidge should dismiss Secretary Work from his Cabinet, and other violent gestures of protest were numerous. The issue is now up to Congress, and much oratory, some execration, and probably further 'relief' will be the result."

ALL THIS that Mr. Strother recites, so far as it is a matter of record, is familiar to readers of MODERN IRRIGATION, but to see a magazine of the type of WORLD'S WORK taking up the reclamation problem for discussion as a leading national issue is encouraging to those who are interested in rehabilitating and extending reclamation activities in general. As Mr. Strother points out, there are lessons implicit in the reclamation situation more important than the persons and funds directly involved:

"In itself, it is a matter of the trials of perhaps 200,000 citizens among 100,000,000—the concerns of two tenths of 1 per cent of the population of the country. It is likewise a matter of perhaps $200,000,000 of government money, which sooner or later, and more or less, is to be returned to the Treasury—an item of small moment by comparison with many others. But, viewed as an experiment in government, how important the issues involved!"

Among the lessons which the experience of federal reclamation teaches, the writer finds, are: that the government should go slow in committing itself to new projects; that the states in which projects are located ought to be compelled to take over the financial burden and the administrative control of their own projects; that, by some means, land speculation must be eliminated; that levelling and draining project lands are as essential as constructing irrigation works; that settlers must be carefully selected and lands properly classified. In many of these conclusions Mr. Strother is in accord with the practically unanimous opinion of all students of the situation; in a few of them he will be questioned by those who can not find justification for the conclusion in the premises.

Summarizing the whole situation the writer declares: "The only way permanently to correct the mistake is to change the whole underlying basis of the operation. The government can lend its credit to the states for these operations; the government can supply engineering skill and agricultural advice; but it cannot supply individual credit or local business management. It is folly to try. The states must assume these burdens."

How One Texas District Is Leading in Reconstruction

(Continued from Page 17)

long, which carry the water up through control gates to the main canal and settling basin. The tubes pass under the track of the Missouri Pacific Railway. Two contraction and expansion joints will be provided.

AT THE lower end of the settling basin, two miles from the pumping plant, the main headgates will be located. For six miles from the pumping plant the canal is located in a normal cutting of about four feet. The present construction calls for a canal twenty feet wide on the bottom, two to one side slopes, eight feet height of levee, and six-foot width of crown. On the lower or south side of the canal the levee will be placed outward sixteen feet, leaving a berm of that width. The grade of this section will be nine inches in 5,000 feet, giving for a seven-foot water depth a velocity of two feet per second, and a discharge of 480 second feet. This berm removed, the grade lowered one foot, and the material used to raise the levee one foot, a canal with capacity to serve all the second bench land in the valley will be produced.

About four and one-half miles from the main head works the canal enters deeper cutting, this varying from four to eighteen feet. There is about four and one-half miles of this section, the grade of which is one in 5,000. The

last section is two miles in length, the bottom grade of which is level. Hydraulic gradient is obtained by a change of the water depth, the depth in the Penitas main being seven feet, and that in the North main of the distribution system five feet. The cross-section of the canal in this section conforms to the required capacity and grade.

The canals of District No. 4 distribution system are designed and constructed using uniform cross-sections and grade. The side slopes are everywhere two horizontal to one vertical. The grade of the North main canal is one in 5,000, and that of the East main one and one-half in 5,000. The grade of the laterals ranges from one to two in 5,000. The area of the district is laid out in four sections of nearly equal area, and a canal is constructed with full capacity to each of these sections. The system is planned for a twenty-day rotation, five days being allowed for delivery to each section. The main laterals are built with a capacity of one second foot for each thirty acres served.

THE STRUCTURES in the main canals and main laterals are built of re-inforced concrete, the aggregate used being in the proportion of one-two-four. The steel used is cold square twisted. The outlet gates from main canals and main laterals are constructed of re-inforced concrete, but the farm outlets from laterals are constructed of creosoted lumber, 12 pounds of creosote per cubic foot of lumber. A farm outlet is provided by the district to each forty-acre tract, this outlet being located on the commanding ground for that tract. Steel outlet gates are being used in all outlets from main canals and main laterals. As far as is possible all structures have been standardized.

Provision for the disposal of seepage and excess rainfall is being made by connecting borrow pits to low points, and there installing crude oil engines directly connected to horizontal centrifugal pumps and pumping the water into the canal for use below.

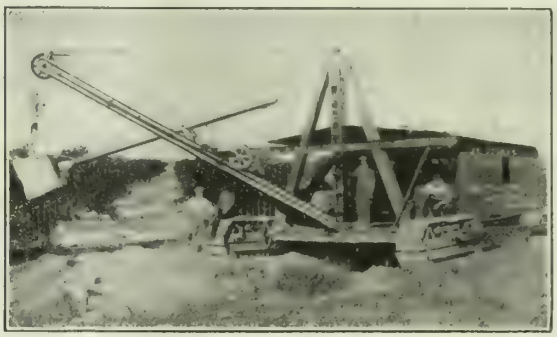
Along the canals at intervals of about one mile gauging stations have been installed for the measurement of the discharge. These gaugings will locate points of large seepage, rendering it possible to repair weak places and prevent excessive losses.

Arrangements are being made to install meters at all farm outlets, and the system placed upon a metering basis. This will reduce waste, excessive use, seepage and the water-logging of thousands of acres of land, and will prove a saving to the individual farmer and to the district as a whole.

For Cleanout -- Maintenance -- New Ditches

There's a Bay City for Every Job

BAY CITY Land Dredges span the ditch, can dig any desired slope, and dump waste on both banks. BAY CITIES leave clean, wide berms, and can work up or down streams. One trip over the ditch is enough. The Shovel Type Dipper handles hard material in which other types of buckets cannot make a good showing.



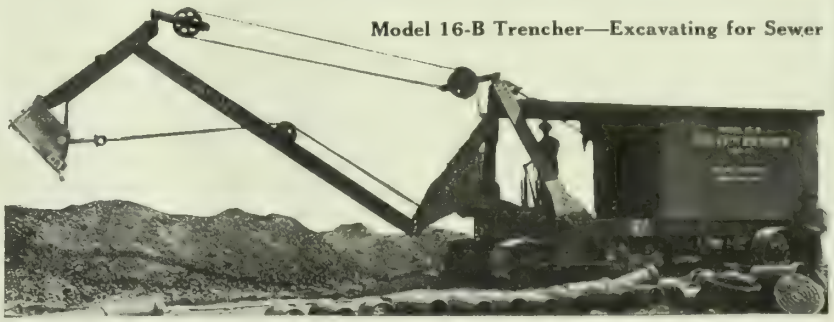
At left—One yard BAY CITY Dredge digging and cleaning ditches in Florida Citrus Groves.

BAY CITY Land Dipper Dredges are built to fit the job. Walking, Crawler, Track or Floating mounting. Easily dismantled, transported and assembled. Capacities ½ to 1½ cubic yards. Oil engine or electric operation.

FOR SMALLER DITCHES — OR PIPE LINE TRENCHES

The BAY CITY 16-B convertible Excavator will handle a wide range of work. Operates Dragline, Trench Shovel, Clamshell or Skimmer. All steel. Shipped assembled. Digs any width or depth up to 20 feet.

Model 16-B Trencher—Excavating for Sewer



or—Model 4 Excavator

BAY CITY Model 4 is a small low-priced convertible, one-man operated Excavator. Fills the gap between hand labor and high priced equipment. Capacity 20 to 40 cubic yards per hour. Gasoline or electric power. A Real Digger economically designed for the small job. Also operates shovel, and clamshell.

IRRIGATION FINANCE

WHEN THE STATE GUARANTEES THE INTEREST

By RHEA LUPER

State Engineer of Oregon

OREGON'S irrigation district law, in its present form, was enacted in 1917, and the constitutional amendment providing for the State guarantee of interest for the first five years on irrigation or drainage district bonds was passed by the people on June 3, 1919. These two laws, the constitutional amendment and the irrigation district code, form the basis upon which irrigation development in Oregon has proceeded thus far.

During the past eight years Oregon has built, under the irrigation district plan, twenty-three projects. Within these projects, when organized, there were 49,400 acres of irrigable land, and today that area has been increased to 120,500 acres, leaving more than 100,000 acres yet to be irrigated.

Under the terms of the law, any irrigation district may borrow money if it can, and may sell its bonds without first obtaining the consent of the State Securities Commission. There is no legal prohibition, but the provision allowing the certification of a certain class of bonds was placed in the law, and now no district can hope to find a market for bonds which have not been certified; therefore, primarily the law had the effect of dividing irrigation districts into two classes, those which were speculative and those which were not.

SPECULATIVE projects were those which we ordinarily term raw projects and which were dependent entirely on values to be created by the construction of the project. They could not meet the requirements of certification.

In the other class are those projects having established values in their lands, not dependent upon the construction of the works entirely for the creation of such values. They were largely colonized and the lands were either being dry-farmed or they included lands which were improved and irrigated, but had an insufficient water supply.

The law provides that before the bonds may be certified the commission must make an investigation and find that the irrigation system is feasible and that the aggregate amount of bonds under consideration, and any other outstanding bonds of said district, does not exceed fifty per cent of the aggregate market value of the lands within the district, and of the water rights and all irrigation works owned or to be acquired or constructed with the proceeds of said bonds.

UNDER the law's application it is evidently intended that a project, to meet the requirements of certification, must not only be feasible, but must have values when completed more than double the amount of its indebtedness. With conservative appraisals it would seem that there could be no loss either to the creditors, to the State, or to the settlers. Where the law has been strictly applied, where appraisals have been conservative, there will be no loss. But on those projects where appraisals were based on inflated values, where the indebtedness created was the maximum allowed under the law, and where, added to that, the districts were loaned additional money by the State with which to pay interest on their bonds, we will have trouble.

Two of Oregon's largest districts are in default on their bonds, and several of the small ones are making no progress. The Slide Irrigation District, on the bench across from Weiser, has a $100,000 pumping plant which was idle this season.

The Warmsprings Irrigation District, containing 27,000 acres of irrigable land, is marking time waiting for action by the Reclamation Service which will give it some relief, but it is in such a condition that no progress in settlement or colonization of its lands can likely be made until there has been a re-adjustment.

The Ocohoco District contains something over 17,000 acres of irrigable land and it, too, is in a very uncertain condition. The settlers feel dazed and do not know which way to turn.

The Silver Lake District was constructed in 1918, yet the area in cultivation and the population of the district has not increased. It is also in default.

I have mentioned these districts by name because I do not wish my remarks to be construed as applying to other successful districts. I do wish to show, however, that after confidence has once been lost it is almost impossible to re-establish it.

The bond underwriters insisted that irrigation district bonds must be general obligations of the entire district. Perhaps they are right, but it seems to me that the general obligation has been a two-edged sword, for when confidence in the success of the district begins to wane it is the thing that causes the settler to lose his credit, regardless of the value of his holdings within the district.

UNDER the law the bonds must be paid from taxes levied by the board of directors of the district as other taxes are levied and collected, and it is mandatory perhaps that the board levy sufficient taxes to meet the estimated expenses of the district. But it is one thing to levy the tax and another to collect it.

The bondholder does not hold a mortgage in the sense we understand on the lands in the district that can be foreclosed. He cannot take possession of the entire area except that indirectly he may, by paying the taxes on particular tracts, secure a tax certificate which may be foreclosed. In that manner he can acquirely title ultimately to those tracts on which taxes have not been paid; but that is a long and tedious process, and before it could be completed the system might fall to decay and the entire project be abandoned. It is not a practical way for the bondholders to be paid.

It is true that he has other recourse, but that also seems impracticable. He may take possession of the irrigation system and have it operated through a re-

ceiver appointed by the court. The law does not define the duties of a receiver in this particular instance. Under those circumstances, it is doubtful if a receiver could get the support of the community. With the projects only partially settled there would be no possible source of revenue from which sufficient funds could be obtained to satisfy the district's creditors, unless he were authorized to treat with each settler individually, and he is not so authorized under the statute. He could not hope to induce any settlers to come on the project and the condition would be worse than it is at the present time.

The law does not contemplate failures, and does not provide a way of meeting such a contingency, and therefore I feel that there is now no law in the state under which we can be assured that our unsuccessful projects can be reorganized.

Niland Bonds Sold

A bond issue of $140,000, voted by the Niland (California) Water District early in December, has been sold at par to Freeman, Smith & Camp, of San Francisco; and R. E. Campbell Company of Los Angeles. Although the acreage covered by the bond issue is within the Imperial Irrigation District, its development is under the Niland Water District because the irrigation district's funds for new construction are exhausted.

Citizens Take Over System

Ten citizens of Pismo Beach have purchased the water system of the community as the climax to protracted litigation directed at improving the quality of service rendered and will operate it with the idea of insuring efficient and inexpensive service, they have announced. The appraised value of the system is $23,000.

Bonds Bring Record Sum

The best price ever obtained for Nampa & Meridian bonds was received when the Nampa (Idaho) State Bank recently purchased $48,500 worth of the district's issue at par and accrued interest.

A Dissenting Interpretation

(Continued from Page 22)

laterals, making it difficult to deliver water as required; and increased flood menace, due to lack of continued experienced investigations and study. It also resulted in the district's having more than $250,000 of registered warrants, with a certainty of more than twice this amount before the first of 1926 unless 1926 taxes are used for 1925 operations. It has, of course, also improved the political organization favored by the majority directors.

All this plainly shows the detrimental effects of the efforts of four directors who are attempting to manage without adequate assistance the details of maintenance, operations, improvements and protection of a project of great magnitude. They must do this, also, in time taken from their regular business, as their compensation is fixed by law at $150 per month.

Unless a radical change is made in the policy, by centralizing authority in trained and experienced hands, I fear that the morale of the district's employees will become very low, and the physical condition of the river control and canal system will deteriorate; and considerable time, with large expenditure of money, will be required to re-establish conditions as they were before.

Preparatory Work Rushed as Kittitas Contract Signed

Preparatory work for the construction of the Kittitas division of the Yakima project in the State of Washington is being rapidly pushed by the Interior Department, following the execution of the contract between the State of Washington and the federal government under which the state assumes responsibility for settlement.

The Bureau of Reclamation has authorized its local representatives to secure at the earliest possible moment the necessary right of ways for canals, laterals, and other irrigation works. According to the plan adopted, these right of ways will be secured through the Kittitas Reclamation District organization and the title subsequently transferred to the United States. Other agreements now being negotiated by the Reclamation Bureau are purchasing of flowage rights above the proposed diversion dam and contracts for building irrigation structures across the tracks of the Northern Pacific Railroad.

Elwood Mead, Commissioner of Reclamation, has also announced that engineers will soon be transferred to duty either from the Denver office of the Bureau or other projects to take charge of the actual construction work on the Kittitas project. An appraisal board already on the division has commenced the appraisal of the lands to be purchased by the Government.

Construction on the Kittitas division of the Yakima project was ordered in December by the Secretary of the Interior after the State of Washington had executed a contract to assume the cost of the settlement and development.

The Mokelumne River Project

(*Continued from Page 15*)

pacity of 30,000 horse power. The water from this power development is all returned to the river and therefore it does not interfere materially with irrigation uses, but has a regulating effect that is beneficial.

There are two other small ditches which divert water from tributaries of the North Fork for mining purposes. These are known as the Jackson and Volcano ditches and have capacities of 20 and 35 cubic-feet per second, respectively. They have largely fallen into disuse.

The Clark ditch diverts a small amount of water from the upper portion of the South Fork for mining purposes, but has not been in service recently. Further down, the Mokelumne ditch diverts a small quantity of water from the South Fork, which is carried to the town of Mokelumne Hill and territory to the southwest, terminating near the town of Wallace. The portion below the town of Mokelumne Hill has been abandoned and the upper portion is used only to a small capacity.

A PRIVATELY owned reservoir site, known as Railroad Flat, has been surveyed and a little construction work done on the foundation of a dam located just below the junction of the Licking Fork with the South Fork about two miles north of the town of Railroad Flat. The project proposing to use this reservoir site involves the construction of a small reservoir on the Middle Fork about two miles northeast of the Railroad Flat Reservoir and the diversion of the storage of the small reservoir by means of a canal and small tunnel into a branch of Licking Fork, whence it will run into the reservoir above described near Railroad Flat. The ultimate feasible capacity of this reservoir with a dam about 325 feet high is said to be in the neighborhood of 60,000 acre-feet, exclusive of the small proposed reservoir on Middle Fork.

The Mokelumne water-shed is distinctly a mountain source of supply, the total drainage area and the elevation of the several parts thereof, being as follows:

Above Lancha Plana Reservoir	568 sq. mi.
Above 2,000 ft. elevation	527 sq. mi.
Above 3,000 ft. elevation	478 sq. mi.
Above 4,000 ft. elevation	409 sq. mi.
Above 5,000 ft. elevation	320 sq. mi.
Above 6,000 ft. elevation	235 sq. mi.
Above 7,000 ft. elevation	174 sq. mi.
Above 8,000 ft. elevation	87 sq. mi.
Above 9,000 ft. elevation	8 sq. mi.

The upper part of the drainage basin is about timber line and is largely of rock, which is either bare or sparsely covered with soil, upon which some grass and alpine shrubs occur. Farther down, forests begin and over two-thirds of the basin is in Forest Reserves.

Agriculture has never gotten a start in this region and the possibility of any considerable development is very remote. The mining industry was important at one time in this basin, but there is now no mining activity.

Practically nothing is being done with the splendid body of timber which stands on the land within this basin. When cutting begins, it would be under the supervision of the United States Forest Service, so far as it is on public land.

The stock raising industry is confined mainly to summer pasturage upon the Forest Reserves, which is strictly limited in amount and becomes negligible in winter.

The only other industry in this basin is the hydro-electric operations of the Pacific Gas and Electric Company, which have been mentioned.

The Mokelumne Basin contains no swamp or marshy areas or other tendency to discoloration of the water and it is distinctly not a sediment producing basin. The water ranks high along with other Sierra sources as pure and soft, and if any treatment is required, it will be slight and inexpensive. Such organic pollutions as creep into the water from this mountain area will be held in storage in a large reservoir which will have a gross capacity of over 200,000 acre-feet.

THE MOKELUMNE project, as adapted to the needs of the East Bay Municipal Utility District, proposes a dam across the Mokelumne River at a point about five miles nearly due north of Valley Springs and about four miles northeast of the old mining camp of Lancha Plana. This dam would be built to a height of about 350 feet above its foundation and raise the water surface to 562 feet above sea level, forming a gross storage capacity of 222,000 acre-feet. It is proposed to draw these waters through a tunnel at elevation about 400 feet above sea level, above which would be an available storage capacity of about 198,000 acre-feet.

Two gaps occur in the perimeter of the basin, one on the north side of the river and one on the south side, both lower than the proposed flow line of the reservoir. The gap on the south side is slightly lower than the one on the north, and discharges its water into Spanish

(*Concluded on Page 48*)

A Many Million Dollared Market

THE REPUBLIC of Mexico will expend $30,000,000 on reclamation projects. As told elsewhere in this issue, an American engineering firm has been placed in charge of this undertaking.

Since America (the United States) leads in the manufacture of the most modern irrigation appliances, and auxiliary equipment of every description, it goes without saying that aside from labor costs the major percentage of these 30 millions will be spent within the boundaries of the United States.

American-made drag-lines, dredges, and other excavating machinery; trucks, tractors and automobiles; cement, cement re-inforcing and other materials; pipe and pipe fittings; gates and valves; motors and motor controls; meters and other odds and ends that go to make up a fully equipped irrigation project—these will have to be provided for, and the United States is the logical source of supply.

The advertising columns of MODERN IRRIGATION are the logical source of current information regarding such equipment. Engineers and other executives, who do ordering or specifying, will find these columns during 1926 a reliable "Who's Who" of manufacturers selling the hydraulic field. Here the leading, most progressive concerns in every line will be represented.

At this moment, the pages of MODERN IRRIGATION are being examined, and examined carefully, by men whose yearly purchases in *your* line aggregate large sums of money. Long-pull advertising will help you to secure a larger percentage of this annual turn-over. The men who buy are reading and studying these advertisements—never doubt it. Consciously, or unconsciously, they are forming their opinions and narrowing down their ultimate choice of equipment. Many actual decisions are made months in advance of the order for the goods. None but the most backward companies in business today are not fully alive to this, while those of seasoned advertising experience are now, as never before, bringing up their advertising artillery for the big year's business ahead.

Mexico's reclamation project is but one of the countless many under contemplation—or actual construction—at this time. Nineteen-twenty-six will be a great year in the irrigation and allied hydraulic industries. Millions will be spent for replacements and other millions for new equipment. Are YOU making your proper bid for a share of this business? Are you represented, as an advertiser, in the columns of MODERN IRRIGATION?

If not, phone, wire or write immediately for rates and complete information. Just say: "We wish to sell more equipment this year to the hydraulic field. How can MODERN IRRIGATION help us do it? Rush full particulars."

OVERHEAD IRRIGATION

WHAT IS YOUR EXPERIENCE?—*AN EDITORIAL*

OVERHEAD irrigation is admittedly a subject of great interest among a large group of irrigators, especially that considerable proportion of the agriculturists of the southwest who raise such crops as oranges, lemons, grapefruit, avocadoes and other fruits that require meticulous cultural care and yield proportionately lucrative returns.

At the time of the establishment of this magazine, the subject was considered of sufficient interest to justify the establishment of a special department to be devoted to the presentation of material of specific interest to those who are using overhead sprinkler equipment in irrigation, or who are considering the possibility of installing such equipment. It was planned that, under this heading, there should be offered the experiences of overhead users, the studies of investigators who were concerned with overhead sprinkling from a scientific aspect, and the contributions of irrigationists who have a specialized knowledge on the use of sprinklers and who are willing to share this knowledge for the benefit of others.

THIS department was not established as a means of propaganda, with the object of selling "overhead" to the irrigation industry. The editors have no axe to grind in this or any other department of the magazine.

If there are irrigators who have given overhead equipment a thorough and adequate trial, and have been convinced that its principle is not adapted to the solution of the particular problems with which they must deal, and that their failure has not been due to collateral factors such as improperly planned equipment, neglected tillage, or any other element in the culture of the crop than the principle of overhead irrigation applied in its most efficient form, those experiences are valuable, and as much a part of the literature on the subject as the story of its successes.

On the other hand, irrigators who have tried out this method of supplying artificially the moisture needed by the growing crop and have found that it succeeds, have an opportunity to help other irrigators, if they will, by telling of the particular principles and practices which they have proved to be effective.

CONTRIBUTORS who have discussed, under this heading, various aspects of overhead practice have emphasized, already, a difficulty early encountered by the editor. That is, that overhead is such a new thing, relatively speaking, that there is a very meagre body of scientific knowledge on the subject. Many advantages are claimed for it by its advocates, but, as pointed out, these enthusiasts are not always in agreement as to the advantages claimed. The man who is most convincing in upholding the superior control of soil moisture which the sprinklers afford, scornfully repudiates the idea that it has any marked effect on the quality of the fruit. The advocate who points jubilantly to the improved quality of fruit possible under "the gentle rain from heaven" that overhead affords, may believe there is little, if any, justification for the assertion that it aids in frost protection. The grower who has found that turning on the sprinklers will hold up the temperature when his neighbors are lighting the smudge-pots, may be inclined to doubt the claims that it will resist wind damage. And the man who has found it most effective in minimizing the injuries wrought by hot, dry winds, possibly considers that it is negligible as a better method of controlling soil moisture than the customary furrow system with which it competes.

Some, of course, have found that overhead lives up to its most optimistic claims in two, or three, or more of these ways; and others collate the testimonials of all of the above and conclude that the advantages claimed in each case have been clearly demonstrated, meanwhile discounting the doubts reflected by the less enthusiastic. Among the more scientific investigators there is likewise marked difference in the importance attached to the various claims. One eminent student of agriculture in Southern California not long ago expressed the conviction that in ten years every citrus grower in the state will be using overhead equipment. The same day another authority, head of a state university department which deals with just such questions, in a conversation with the present writer, pooh-poohed such an assertion and expressed his doubt as to whether anyone could say that overhead systems would still be in use after that period of time.

BUT, in spite of the fact that overhead irrigation is relatively new, those who are daily using it have their own convictions, which are probably better founded than that of any office observer, as to its advantages, its adaptability to various conditions, and its future. MODERN IRRIGATION invites these users to write to this department and tell what they have learned of overhead and its use. You, who have installed overhead equipment and are using it in the growing of crops, will you not contribute for the benefit of others the results of your experience?

We want your personal, informal letters, telling what you think of overhead, but, more especially, why you think as you do. These letters will be published in forthcoming issues of the magazine.

If you have recently installed an overhead system, a description of its principal features, a statement of costs, a sketch of the plan showing the size of pipe used in its different elements, and a discussion of the cultural problems that induced you to decide to install overhead equipment would be very helpful to the readers of this department.

If you have been for some time a user of overhead, summarize the lessons which you have learned about its operation and usefulness, and give the results attained in the current year—what superiorities, (or lack of them) it has manifested, and how your crops compares in quality and quantity with that of your neighbors who do not have overhead.

We make complete installation if desired

4360 WORTH ST. Ph: ANgelus 7146 LOS ANGELES

Be definite, be practical, give figures, if possible let us have a photograph of your installation. Your story will not prove or disprove the merit of the overhead idea, but it will be interesting and helpful to those who may be facing the same problems that you are daily encountering.

NOT LONG ago a gentleman who is professionally interested in the problems of irrigated agriculture, and who is an authority on many aspects thereof, was talking with the editor. "I do not think," he said, "that some of your articles on overhead irrigation are worthy of a scientific journal." He was right; but there is no body of scientific knowledge on this subject available for use. He will not be satisfied, probably, that the letters from users of overhead equipment constitute a contribution to the literature of the subject from a scientific standpoint. But the best thing—the only thing—that we can do is to attempt to work this thing out together, by exchanging our experiences, limited and isolated as they may be, and by deriving mutual profit from the interchange of thoughts on the subject.

Meanwhile the magazine will be alert for contributions on the subject from men who can speak from broad observation, who can generalize from their contact with a multitude of overhead systems, who have learned its secrets, or are learning them, by laboratory and field experiments, and we will present the opinions of such contributors whenever they are available. But the individual farmer, whether he has two acres or a hundred under the sprinklers, has something that he can contribute, and his cooperation is respectfully requested.

Davis Describes Big Mokelumne River Project

(*Continued from Page 44*)

Springs Gulch, which will lead them back into the Mokelumne River about one-quarter of a mile below the dam site. It will be necessary to build an embankment across this gap about 20 feet high to secure the desired storage height in the reservoir.

The gap on the north side would discharge waters into Jackson Creek, whence they would flow into Dry Creek and be available for storage in any reservoir provided at or below that point.

A large reservoir site on Dry Creek is not available for development under present circumstances, because the flow of water in Dry Creek is so meager and uncertain that its storage would be expensive and results very small and precarious. The provision of a high dam

on the Mokelumne sufficient to throw all the surplus waters to the northward makes available about two-thirds of the flow of the Mokelumne River, or an average of over 500,000 acre-feet per annum. The provision of this high dam, therefore, without expense to the irrigation interests, is a great and positive benefit to irrigation development, and it is hoped that this contribution by the District will lead to the early development of the Mokelumne Basin with a completeness and economy not possible on most other streams in California.

Tacoma Plans Million Dollar Water Improvement Program

Main Unit Is Construction of Twenty-five Million Gallon Reservoir for the City

Tacoma, Washington, has a program of water improvement for 1926 that will involve the expenditure of a million dollars, for which six per cent serial bonds have been issued. Ira S. Davisson, commissioner of Light and Water, recently outlined the improvements planned under this program.

The principal development will be the construction of a reservoir of 25,000,000 gallon capacity. This reservoir will be constructed near the site of the present reservoir of the Tacoma Water Supply Company, and will have facilities to serve the entire North End of the city. The reservoir will match the approximate capacity of the entire city system now.

Adjacent to the new reservoir will be constructed a 1,000,000-gallon standpipe, with a pumping station capable of handling 10,000,000 gallons of water a day.

The money received from the sale of the bonds will also be used for the construction of a spillway from the reservoir to Puget Sound, through which surplus water can be wasted.

The second item in connection with the bond issue has to do with the acquisition of the Tacoma Water Supply Company, which now serves approximately 2,600 customers in the North End of Tacoma and in Ruston. It is now planned to acquire the system by purchase, but should a deal now pending fail to materialize, it is stipulated that condemnation proceedings be started.

Prosser Now Owns System

The city of Prosser, Washington, has purchased from the Pacific Light & Power Company the municipal water system for a consideration of $10,000.

SURVEY *of* HYDRAULIC DEVELOPMENT

As Shown by Official Records of the Month -- Local, State, and Governmental

PERMITS AND APPLICATIONS SHOW INCREASING ACTIVITY

AMONG the more important permits to appropriate water issued by the Department of Public Works, Division of Water Rights of California, during the month of November, 1925, were the following:

Permit No. 2299, Application No. 4275 (San Joaquin County). Issued to Mrs. Annie Fabian, et al, Tracy, Calif., November 2, 1925, for 17.5 cubic feet per second from Old River in Section 3, T 2 S, R 4 E, M. D. M., for irrigation of 1422.3 acres near point of diversion. Estimated cost $15,000.

Permit No. 2300, Application No. 4276 (San Joaquin County). Issued to A. Grunauer, et al, Tracy, Calif., November 2, 1925, for 29.87 cubic feet per second from Old River in Section 3, T 2 S, R 4 E, M. D. M., for irrigation of 2514.8 acres near point of diversion. Estimated cost $25,000.

Permit No. 2301, Application No. 4500 (Riverside County). Issued to Luz S. Guirado, Whittier, Calif., November 3, 1925, for 0.27 cubic feet per second from an unnamed spring in Section 24, T 5 S, R 6 W, for domestic and irrigation of 60 acres near point of diversion. Estimated cost $1740.

Permit No. 2302, Application No. 4517 (Butte County). Issued to F. D. Popejoy and Jackson Mullings. Enterprise, Calif., November 3, 1925, for 1.25 cubic feet per second from Big Frey, Little Frey and Grubbs Creeks in Sections 30 and 31, T 21 N, R 7 E, M. D. M., Section 36, T 21 N, R 6 E, M. D. M., for domestic and irrigation of 100 acres near point of diversion. Estimated cost $1500.

Permit No. 2306, Application No. 4019 (Alpine County). Issued to Richard Heimsoth, et al, Woodfords, Calif., November 5, 1925, for 750 acre feet per annum from 3 unnamed gulches in Section 12, T 9 N, R 18 E, Section 1, T 9 N, R 18 E, Section 7, T 9 N, R 19 E, for irrigation of 929.6 acres near point of diversion.

Permit No. 2307, Application No. 992 (Modoc County). Issued to Royal A. Payne and Gertrude Payne French, Alturas, Calif., November 6, 1925, for 837 acre feet per annum from Flood and surplus waters of Fitzhugh Creek in Section 15, T 41 N, R 13 E, for irrigation of 251 acres near point of diversion.

Permit No. 2308, Application No. 993 (Modoc County). Issued to Royal A. Payne, Alturas, Calif., November 6, 1925, for 457 acre feet per anum from flood and surplus waters of Fitzhugh Creek in Section 23, T 41 N, R 13 E, for irrigation of 140 acres near point of diversion. Estimated cost $10,000.

Permit No. 2309, Application No. 994 (Modoc County). Issued to Gertrude Payne French, Alturas, Calif., November 6, 1925, for 157 acre feet per annum from flood and surplus water of Fitzhugh Creek in Section 23, T 41 N, R 13 E, for irrigation of 120 acres in Section 12. Estimated cost $1500.

Permit No. 2314, Application No. 4192 (Ventura County). Issued to Thomas O'Brien, Lebec, Calif., November 10, 1925, for 0.13 cubic feet per second from Sam Young Spring in Section 6, T 8 N, R 19 W, for domestic, stockwatering and irrigation of 151.24 acres in Section 6. Estimated cost $1700.

Permit No. 2324, Application No. 4537 (San Joaquin County). Issue to J. J. Hickey and Amuda Hickey, Stockton, Calif., November 17, 1925, for 2.75 cubic feet per second from Burns Cutoff in Section 12, T 1 N, R 5 E, for irrigation of 220 acres near point of diversion.

Permit No. 2325, Application No. 4018 (Eldorado County). Issued to Rose V. Jones, Vallejo, Calif., November 17, 1925, for 0.15 cubic feet per second from Little Iowa Creek in Section 33, T 11 N, R 12 E, for domestic use and irrigation of 138.6 acres near point of diversion.

Permit No. 2326, Application 92 (Butte County). Issued to Paradise Irrigation District, Paradise, Calif., November 18, 1925, for 4148 acre feet per annum from Little Butte Creek in Section 18, T 23 N, R 4 E, for irrigation of 11,100 acres in said district. Estimated cost $125,000.

Permit No. 2327, Application No. 2894 (Butte County). Issued to Paradise Irrigation District, Paradise, Calif., November 18, 1925, for 3000 acre feet per annum from West Branch of Feather River in Section 28, T 25 N, R 4 E, Section 18, T 23 N, R 4 E, Section 25, T 23 N, R 3 E and Section 19, T 24 N, R 4 E, for irrigation of 11,100 acres in said district. Estimated cost $325,000.

Permit No. 2328, Application No. 3437 (Butte County). Issued to Paradise Irrigation District, Paradise, Calif., November 18, 1925, for 50 cubic feet per second and 5000 acre feet per annum from West Branch of Feather River in Section 28, T 25 N, R 4 E, Section 18, T 23 N, R 4 E, Section 25, T 23 N, R 3 E, and Section 19, T 24 N, R 4 E, for irrigation of 11,100 acres in said district. Estimated cost $325,000.

Permit No. 2329, Application No. 3405 (Eldorado County). Issued to E. T. Larsen, Placerville, Calif., November 19, 1925, for 1.25 cubic feet per second and 60 acre feet per annum from Brush Canyon in Section 31, T 11 N, R 12 E, for domestic and irrigation of 100 acres in Section 35. Estimated cost $5,000.

Permit No. 2330, Application No. 4502 (Eldorado County). Issued to Phillip E. Hartwick, Camino, Calif., November 19, 1925, for 80 acre feet per annum from Brush Canyon in Section 32, T 11 N, R 12 E, for domestic and irrigation of 120 acres in Section 32. Estimated cost $2500.

Permit No. 2331, Application No. 4480 (Napa County). Issued to C. Skrable, Monticello, Calif., November 17, 1925, for 1.25 cubic feet per second from Putank Creek in Section 5, T 8 N, R 3 W, for irrigation of 100 acres near point of diversion. Estimated cost $4000.

Permit No. 2335, Application No. 4487 (Humboldt County). Issued to Peacock Mining Company, Oakland, Calif., November 24, 1925, for 16 cubic feet per second from Camp Creek in Section 23, T 11 N, R 5 E, for power purposes in Section 23. 96 T. H. P. to be developed. Estimated cost $3600.

Applications Filed

Among the applications for permit to appropriate water filed with the State Department of Public Works, Division of Water Rights, (California) during the month of November were the following:

Application No. 4824 (Shasta County) Red River Lumber Co., Westwood, Calif., for 10 cubic feet per second from Hat Creek tributary to Pit River to be diverted in Section 28, T 33 N, R 5 E, M. D. M. for power purposes in N E ¼ S W ¼ Section 8, T 33 N, R 5 E, M.D.M. 676 T. H. P. to be developed. Estimated cost $630,000.

Application No. 4825 (Los Angeles County) San Gabriel Water Co., care J. B. Lippincott, 543 Petroleum Sec. Bldg., Los Angeles, Calif., for 6 cubic feet per second from San Gabriel River tributary to Pacific Ocean to be diverted in Section 13, T 1 N, R 10 W, S. B. M. for municipal purposes in San Marino, portions of Pasadena, San Gabriel, Roseweed, Lamanda Park.

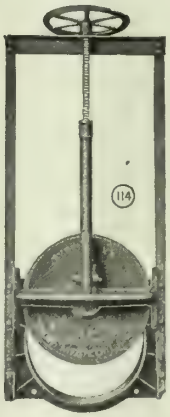
Application No. 4827 (San Diego County) Webster N. Kenyon, Box 22, Westmoreland, Calif., for 2 cubic feet per second from White Mountain Creek tributary to San Felipe Creek to be diverted in Section 11, T 13 S, R 8 E, S. B. M. for agricultural and domestic purposes on 160 acres. Estimated cost $4000.

Application No. 4828 (San Diego County) Webster N. Kenyon, Box 22, Westmoreland, Calif., for 3.5 cubic feet per second from Holly Creek (Underground Water tributary, San Felipe Watershed to be diverted in Section 13, T 13 S, R 8 E, S. B. M. for agricultural and domestic purposes on 280 acres.

Application No. 4830 (Tulare County) Myers Land Co., 6329 Pasadena Avenue, Los Angeles, Calif., for 0.05 cubic foot per second from Unnamed Springs (47) tributary to Capenero Creek to be diverted in Sections 4, 8 and 9, T 24 S, R 31 E, M. D. M. for domestic purposes in Sections 4 and 5, T 24 S, R 31 E, and Sections 32 and 33, T 23 S, R 31 E, M. D. M. Estimated cost $2000.

Application No. 4832 (Mendocino County) Agnes C. Thomas, care of Cunningham and Thomas, Ukiah, Calif., for 0.99 cubic foot per second from Russian River tributary to Pacific Ocean to be diverted in Section 16 T 15 N, R 12 W, M. D. M. for agricultural

·SNOW·
IRRIGATION APPLIANCES



SNOW STANDARD HEAD GATE, a heavy duty gate, rigid, substantial, extra strong, is adapted for use in all kinds of pipe, flumes, reservoirs, etc.

The gate and gate frame proper are of cast semi-steel; the frame extension is of structural steel, this extension and the screw can be furnished in any desired length to conform to the height of the wall.

The Standard Head Gate is made with either round or square openings and with either iron seat or brass seat in sizes six inch to forty-eight inch.

The non-rising steel screw with Acme machine cut threads operates through a bronze nut in the yoke; pressure from this yoke is exerted on the center of the gate lid, thereby giving an equal bearing around the entire circumference as the lid slides into place on the wedge shaped seat. Both lid and seat are accurately machined, making unnecessary the use of packing or gasket.

THE WEDGE SEAT

Easy to install and easy to operate, closing positively, accurately and water tight, without dragging on the seat.

A rising screw can be furnished, if preferred.

purposes on 79.24 acres in Sections 16 and 21, T 15 N, R 12 W, M. D. M.

Application No. 4834 (Plumas and Butte Counties) Oroville Wyandotte Irrigation District, care of R. A. Leonard, Atty., First Nat'l. Bank Bldg., Oroville, Calif., for 2,080 cubic feet per second and 300,262 acre feet per annum from South Fork Feather, Lost Creek, Dry Creek, New York Flat Creek tributary to Middle Fork Feather River to be diverted in Section 31, T 22 N, R 9 E, Section 21, T 21 N, R 8 E, Section 24, T 20 N, R 7 E Section 18, T 19 N, R 7 E, Section 1, T 20 N, R 8 E, Section 26, T 19 N, R 6 E, Section 20, T 20 N, R 8 E, Section 25, T 19 N, R 6 E, M. D. M., for power purposes. 75,028 T. H. P. to be developed. Estimated cost $4,000,000.

Application No. 4835 (Placer County) Fred Dewhirst, care of Emerson Hoar Co., 995 Market St., San Francisco, Calif., for 300 cubic feet per second, 100,000 acre feet per annum from Bear River tributary to Feather River to be diverted in Section 2, T 13 N, R 8 E, M. D. M. for power (Hydro-electric) purposes. 33,000 T. H. P. to be developed.

Application No. 4838 (Riverside County) James Kincheloe, Star Route, Corona, Calif., for 3.06 cubic feet per second from Bedford Canyon tributary to Temescal, Wash., to be diverted in Section 25, T 4 S, R 7 W, S. B. M., for agricultural and domestic purposes on 245 A in Sections 19, 20 and 30, T 4 S, R 6 W, S. B. M. Estimated cost $18,000.

Application No. 4840 (Los Angeles County) City of Long Beach Water Department, 607 City Hall, Long Beach, Calif., for 70 cubic feet per second and 65,000 acre feet per annum from San Gabriel River tributary to Pacific Ocean to be diverted in Section 13, T 1 N, R 10 W, S. B. M., for municipal purposes to supply city of Long Beach.

Application No. 4841 (Yolo County). Mrs. P. J. Brown, Grafton, Calif., for 7.45 cubic feet per second from Sacramento River tributary to Suisun Bay. To be diverted in Section 32, T 10 N, R 3 E, M. D. M., for agricultural purposes on 298 acres Section 32, T 10 N, R 3 E, M. D. M.

Application No. 4842 (Santa Cruz County). Forest Lakes Mutual Water Company, care of Geo. H. Hoyt, Secretary, Berkeley Bank Bldg., Berkeley, Calif., for 0.6 cubic foot per second and 100 acre feet per annum from Gold Gulch tributary to San Lorenzo River to be diverted in Section 27 (projected) T 10 S, R 2 W, M. D. M., for domestic purposes in projected Sections 27 and 28, T 10 S, R 2 W, M. D. M. Estimated cost $10,000.

Application No. 4843 (El Dorado County). Chas. F. Bradford, 2907 Fillmore street, San Francisco, Calif., for 75 cubic feet per second and 20,000 acre feet per annum from North Fork Cosumnes tributary to Cosumnes River to be diverted in Section 10, T 9 N, R 14 E, M. D. M., for power (hydro-electric) purposes in Section 35, T 10 N, R 13 E, M. D. M. 12,784 T. H. P. to be developed.

Application No. 4844 (Amador and El Dorado Counties). Chas. F. Bradford, 2907 Fillmore street, San Francisco, Calif., for 30,000 acre feet per annum from Middle Fork Cosumnes River, Sapidgo Creek, So. Fork South Fork Cosumnes tributary to Cosumnes River to be diverted in Section 9, T 8 N, R 14 E, M. D. M., Section 12, T 8 N, R 13 E, M. D. M. and Section 33, T 8 N, R 13 E, M. D. M. for power (hydro-electric) purposes in Section 6, T 7 N, R 13 E, M. D. M. 6,318 T. H. P. to be developed.

Application No. 4845 (El Dorado County). Chas. F. Bradford, 2907 Fillmore St., San Francisco, Calif., for 130 cubic feet per second and 36,500 acre feet per anum from Middle Fork Cosumnes River tributary to Cosumnes River to be diverted in Section 19, T 9 N, R 12 E, M. D. M. for power (hydro-electric) purposes in Section 19, T 9 N, R 11 E, M. D. M. 9,955 T. H. P. to be developed.

Application No. 4846 (El Dorado County). Chas. F. Bradford, 2907 Fillmore St., San Francisco, Calif., for 100 cubic feet per second and 20,000 acre feet per annum from North Fork Cosumnes River tributary to Cosumnes River to be diverted in Section 7, T 9 N, R 12 E, for power (hydro-electric) purposes in Section 19, T 9 N, R 11 E, M. D. M. 5,909 T. H. P. to be developed.

Application No. 4847 (San Mateo County). Peninsula Farms Co., Pescadero, Calif., for 1.5 cubic foot per second from Gazos Creek tributary to Pacific Ocean to be diverted in Section 1, T 9 S, R 5 W, M. D. M., for agricultural and domestic purposes on 250 acres. Estimated cost $20,000.

Application No. 4848 (San Mateo County). Peninsula Farms Co., Pescadero, Calif., for 2.67 cubic feet per second from Butano Creek tributary to Pacific Ocean to be diverted in Section 15, T 8 S, R 5 W, M. D. M., for agricultural and domestic purposes on 880 acres. Estimated cost $30,000.

Application No. 4849 (Mendocino County). E. L. Cunningham, care of Cunningham and Thomas, Ukiah, Calif., for 1.65 cubic feet per second from E. Fork Russian River tributary to Russian River to be diverted in Section 22, T 16 N, R 12 W, M. D. M., for agricultural and domestic purposes on 132 acres in Section 22, T 16 N, R 12 W, M. D. M.

Application No. 4850 (San Bernardino County). Alfred Violette 15 A Linden Ave., Long Beach, Calif., for 40,000 acre feet per annum from Antelope, Arrestre Creek and Rattlesnake Canyon tributary to Mohave Desert to be diverted in Section 2, T 1 N, R 5 E, S. B. M., Section 22, T 3 N, R 2 E, S. B. M., and Section 19, T 3 N, R 3 E, S. B. M., for agricultural and domestic purposes on 11,000 acres in Sections 30, 31 and 32, T 2 N, R 6 E, Sections 1, 3 and 5, T 1 N, R 6 E, and Sections 3, 5, 6, 7, 10, 14, 15, 16, 17, 19, 21, 22, 27, 28, 29, T 1 N, R 7 E, S. B. M.

Application No. 4851 (Placer County). Pacific Gas and Electric Co., 245 Market St., San Francisco, Calif., for 300 acre feet per annum from Six Mile Valley tributary to North Fork of North Fork of American River to be diverted in Section 25, T 17 N, R 12 E, M. D. M. for agricultural and domestic purposes to supply present demand for increase of sales to present irrigators along route of present Boardman Canal, domestic service for Colfax, Auburn and Newcastle. Estimated cost $1,500.

OREGON

The following applications for permit to appropriate water have been filed in the office of Rhea Luper, State Engineer of Oregon:

Dr. John B. Gregory of Wallowa, covering the appropriation of water from Bear Creek for irrigation of 18 acres in Wallowa County.

W. W. and C. F. Garrett of Grants Pass, covering the appropriation of water from Louse Creek for irrigation of 33 acres in Josephine County, at a cost of $500.

Ralph W. Allen of Adams, covering the appropriation of water from Wildhorse Creek for irrigation purposes in Umatilla County.

J. H. Paterson of Willamina, covering the appropriation of water from Carter Creek and La Follette Creek for irrigation of 12 acres in Polk County.

Thomas J. Tyrrell of Unity, covering the appropriation of water stored in Tyrrell Reservoir for irrigation of 70 acres in Baker County, at a cost of $1,800.

George B. Inks of Kerby, covering the appropriation of water from Illinois River for irrigation of 30 acres in Josephine County, at a cost of $500.

Victor Nault of Baker, covering the construction of the Nault Reservoir for storage of 49 acre feet of the waters of West Fork of Sutton Creek for irrigation of 20 acres in Baker County, at a cost of $5,100.

S. H. Edwards of Mayville, covering the construction of the Alderdale Irrigation Project Reservoir for storage of 16 acre feet of water from Thirty Mile Creek for irrigation of 100 acres in Wheeler County, at a cost of $1,000.

Pacific Live Stock Company of Burns, covering the appropriation of water from Big Springs for irrigation of 47.1 acres in Harney County, at a cost of $200.

R. J. Allen of Cove, covering the appropriation of water from Mill Creek for irrigation of 160 acres in Union County, at a cost of $1,000.

May and Anne H. Shogren of Portland, covering the appropriation of water from Mosier Creek for irrigation of 40 acres in Wasco County.

Jerry Fiala of Oregon City, covering the appropriation of water from Tualatin River for irrigation of 20 acres in Clackamas County, at a cost of $500.

Alex and Edna Ison MacDougall and Virgil S. Ison of Baker, covering the appropriation of underground percolation in the Pine Creek District for irrigation of 40 acres in Baker County.

J. B. Pilkington of Portland, covering the appropriation of Fanno Creek for irrigation of 40 acres in Washington County.

Roy F. Pugsley of Diamond, covering the appropriation of water from Keiger and McCoy Creeks for irrigation of 40 acres in Harney County.

Fred W. Falconer of Pendleton, covering the appropriation of water from Pumpkin Creek for irrigation of 40 acres in Wallowa County.

T. A. Sammis, Jr., of The Dalles, covering the construction of Mt. Hood Flat Reservoir for storage of 1600 acre feet of water from Dog River, Mill Creek and Three Mile Creek, and the construction of Five Mile Reservoir for storage of 15,500 acre feet from Dog River, Eight Mile Creek, Five Mile Creek and Three Mile Creek, and the appropriation of the stored water for irrigation and domestic purposes in Wasco County, at a cost of over $450,000. These filings are made for the benefit of a proposed irrigation district and will be turned over to the district if found feasible.

Thomas C. Fargher of Dufur, covering the appropriation of water from Denny Creek for irrigation of 22 acres, and from Mays Creek for irrigation of 6 acres, in Wasco County.

Con Fitzgerald of Plush, covering the construction of the Colvin Lake Reservoir for storage of 63.5 acre feet of melting snow for irrigation purposes in Lake County.

La Mesa Awards Contract

The bid of H.H. Peterson to install the new water distributing system for the Mt. Nebo residence section of La Mesa, California, was accepted, and contract awarded in connection therewith. The bid was in the amount of $20,913.13. The job includes the installation of cast iron water pipes throughout the entire section, the installation of a pressure pump, construction of a new concrete storage tank, and the installation of fire hydrants.

California Division of Water Rights Submits Annual Report for 1925

STIMULATED public interest in irrigation is traced to the long unbroken cycle of dry years through which California has been passing, by Edward Hyatt, Jr., Chief of the Division of Water Rights, in his annual report submitted during January.

The following are quotations from the report, summarizing some aspects of its activities during the year:

"The cycle of dry years through which the State of California has been passing remains unbroken which fact is stimulating public interest in all lines of effort which engage the attention of the Division. Out of a total of twelve typical California rainfall stations of the United States Weather Bureau which have reported to date only two, San Diego and Bakersfield, have had more than a normal precipitation and of the remaining ten stations Sacramento reports the lowest percentage of normal rainfall (37½ per cent) and Fresno reports the highest percentage of normal (97 per cent). These conditions have created an increasing demand for an accurate determination of the water rights on various streams and distribution of water by state agency to the several claimants in accordance with their adjudicated rights.

"While it is too early to venture a prediction as to the 1926 season, it is worthy of note that particularly in northern California the outlook is very unfavorable. At Sacramento and Red Bluff the seasonal precipitation on January 1st was almost identical with that at the same time in 1924 which was the driest year on record, and there was only two inches of snow at the Summit as against 32 inches on January 1, 1924. Southern California has been somewhat more favored than in 1924 in the matter of rainfall but the situation is hardly more encouraging in view of the fact that in many sections where wells are depended upon the ground water is at the lowest known level. . . .

"It is gratifying to be able to report a reduction in the number of applications awaiting action from 890 pending cases to 746, which is the lowest number awaiting action since 1920. This means that plans for development may be expedited. During the past year 465 applications to appropriate were received, 411 were approved, and 198 were cancelled. Since the office was first established in 1915 4857 applications have been received of which 2339 have been approved, 1772 have been cancelled and as noted above 746 are awaiting action.

"Fifteen suits have been instituted in the courts to secure reversal of action taken by the Division upon the 4109 applications approved or rejected and as yet none of these suits have been successful.

"The work of the Sacramento San Joaquin Water Supervisor which was undertaken in 1924 with funds provided by public subscription has been continued during the past season with funds provided by the last legislature. This work is costing approximately $20,000 per year and it is expected will be continued again throughout the coming year. This work is intended to provide an accurate record of diversions from Sacramento River and the lower San Joaquin River and Delta Channels, and also information as to water duty and available supply which will be invaluable in forestalling the threatened litigation between upper and lower water users on these two streams. . . .

"More than 600,000 acres of land in Fresno and Kings Counties are irrigated from the Kings River, by means of about 30 diversion canals. For 50 years there had been dissension and litigation between the various ditches when the subject was referred to the Division in 1922 for the preparation and operation of a schedule of diversions. Such a schedule was prepared and C. L. Kaupke appointed watermaster and since then the water available has been distributed by Mr. Kaupke in accordance with the schedule. Litigation has ceased and each ditch has actually received its agreed upon share of the water. In 1925 a difference of opinion arose among the Kings County canals but after a thorough investigation into its causes and a hearing at Hanford December 1st, the points of conflict were adjusted and the operation of the schedule for 1926 assured.

"Although the water of the San Gabriel River in Los Angeles County is small compared to other streams in California, it is one of the most important rivers and presents at the present time the most baffling technical and legal problems before the Division.

"A searching hydraulic investigation of the whole San Gabriel drainage area was started by the Division in 1923 and has progressed two years but due to the excessive dryness of these two years it has not yet been possible to secure needed data as to flow, absorption into the groundwater, etc., and the study must therefore be continued. The cost of the work has been advanced by local interests, the County of Los Angeles being the main contributor."

KIMBALL
DIRECT FLOW TURBINE
PUMPS

For any well from 7 inches up. Gives 400% more clearance than centrifugal pumps. In replacing pit pumps the Kimball can be hung over present pit.

AMONG OUR CONTRIBUTORS

Editorial Jottings About Current and Forthcoming Feature Articles, Dealing With Practical Problems of Hydraulics, and the Men Who Have Written Them

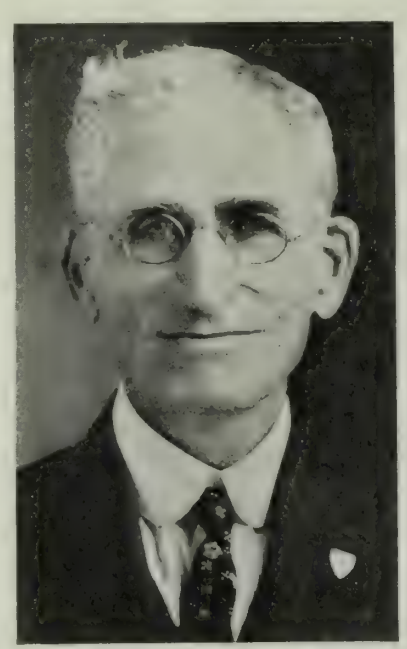
PROFESSOR FRANK ADAMS' varied career in the field of water development has already been sketched in this issue, in the article dealing with the group of the Board of Advisors of which he is a valued member. His article on "Conserving and Controlling Western Waters" is a part of a paper which he recently delivered before the western division of the Chamber of Commerce of the United States, meeting at Seattle, Washington. The second part of this paper, dealing with the close relationship which exists between conservation on the one hand and reclamation on the other, will appear in a later issue of the magazine.

ARTHUR P. DAVIS is also a member of the Board of Advisors of MODERN IRRIGATION, and his professional career has been sketched in our columns in preceding issues. He is, in very fact, the type of man of whom it may well be said that he needs no introduction, especially to an audience composed of representatives of the hydraulic industry. His engineering work has been of world-wide scope, including surveys for the United States government, from 1897 to 1901, of the proposed isthmian canals in Panama and Nicauragua, service as a member of the consulting board for the Panama Canal, consulting work for important hydraulic structures in Porto Rico, investigations for the government of Russia in Turkestan, studies of flood conditions in China, and service in various other capacities in China, Mexico, Alaska and many parts of continental United States. For more than twenty years he was identified with the Reclamation Service, and for almost ten years was its Director. He is now chief engineer and general manager of the East Bay Municipal Utility District, whose great water development project he describes in this issue.

WILLIAM L. ROCKWELL, who writes on the reconstruction plan of an important water improvement district of Texas, in the lower Rio Grande Valley, is another well-known engineer. His experience has included work in practically every part of the west. He was assistant city engineer of Spokane, Washington, 1888-1890; assistant engineer Yakima and Columbia Canal Company, 1891; 1892-1895, chief engineer Prosser Falls and Priest Rapids Irrigation Company, Washington; 1895-1898, chief engineer Stanislaus and San Joaquin Land & Water Company, a project covering 200,000 acres along the Stanislaus River in California; 1898-1908, hydraulic engineer employed jointly by the Kern County Land Company and Miller & Lux, large California water development concerns.

Since 1908 he has been actively connected with water developments in Texas, first in the service of the irrigation division of the United States Department of Agriculture, and successively in private practice and as consulting and supervising engineer for Hidalgo County Water Improvement District No. 4. In 1919, however, at the request of the Haitian government, he was sent by the Department of Agriculture to Haiti to investigate and report upon a proposed 90,000-acre irrigation project, the Cul de Sac, near Port au Prince. After submitting his report he resigned from the service of the Department and returned to Haiti and spent two years in planning the development of a large cotton and sugar-cane plantation.

Since his connection with the Hidalgo County developments he has, in addition to his work for the district, reported on irrigation features of eight different Texas projects varying in area from 30,000 to 150,000 acres. He is the author of numerous technical publications dealing with irrigation problems in Texas and elsewhere.



W. L. ROCKWELL

JOURNALS of the type of MODERN IRRIGATION seldom have the opportunity of welcoming contributors of the fairer and more poetic sex to their columns, but in this issue MISS CRISTEL HASTINGS has written an interesting sketch which combines in a most attractive way the practical and the romantic aspects of irrigation development. Miss Hastings in herself is a rather unique complex of interests, for in addition to being assistant secretary of the Pacific Coast Electrical Association, she is a writer and poet of more than local repute. Three magazines published in San Francisco are carrying stories written by Miss Hastings in their current issues, and she has just issued a new volume of verse, "Alta California," which is occasioning a good deal of interest among those who are not dry-as-dust technologists like the readers of this magazine. We feel, however, that all of us like some sweetness to lighten a more substantial diet, and Miss Hastings' story on the Morris Dam is welcome not only for the valuable information which it contains, but also for the romance which she has infused into a subject which the engineer envisions in terms of stresses, cubic-yards of concrete, and acre-feet of water.

The second installment of B. J. Seger's informing article on irrigation credit appears on Page 18. Mr. Seger is by this time no stranger to readers of MODERN IRRIGATION, having been introduced in these columns on the occasion of previous contributions.

CONTRIBUTORS to departments in this issue are men ably qualified to discuss the respective questions with which they deal. George M. Neel is state engineer of New Mexico. He tells of the major irrigation needs of that state. Hardy W. Campbell has spent almost a life time in reclamation and land settlement work for various railways, his present position being that of farm advisor for the Southern Pacific Company. Major O. V. P. Stout is identified with the Division of Agricultural Engineering, Bureau of Public Roads, of the U. S. Department of Agriculture, at Berkeley, California. He is chairman of the reclamation division of the American Society of Agricultural Engineers. Rhea Luper is state engineer of Oregon, and is intensely interested in and well informed upon both the financial and technical phases of irrigation developments of that state. M. R. MacKall is hydraulic engineer for the Railroad Commission of the state of California. His contribution in this issue is a continuation of his article in the December number, in which he dealt with the principles of public utility rate fixing.

SOME practical considerations of forest protection are now attracting considerable attention in the west on account of the legislation before Congress that would provide increased federal appropriations for this purpose. In the February issue, E. N. Munns, Chief of the Office of Forest Experiment Stations at Washington, D. C., will contribute a valuable article on the subject of "Fire and Water," in which the relationship between those two servants of mankind is forcefully brought out. Another interesting feature in the February issue will be a discussion of the experimental dam that is being constructed on Stevenson Creek, a tributary of the San Joaquin River, and will be tested to destruction by the Engineering Foundation of New York. The experiment will be one of the most interesting ever conceived by the engineering profession, for the dam to be destroyed and studied will be a full size arch dam, comparable in size to a large number of existing structures of the kind in actual service.

THE BUYERS' GUIDE TO LEADING SUPPLY SOURCES

Listing Practically All Standard Equipment Used in the Irrigation Country

THE IRRIGATION and hydraulic industry has, in the past, been greatly handicapped for the lack of some centralized Bureau of Information. Many jobbers, dealers and manufacturers representatives throughout the irrigation country have considered representation for commercial products of different types but did not know where to locate the names and addresses of the manufacturers of such appliances. The men who do ordering and specifying have not, in many cases, been able to consult an authentic directory of reliable equipment when writing for catalogs or quotations, compiling cost estimates or making out purchase orders. IN SHORT, THERE HAS BEEN NO STANDARD BUYERS GUIDE FOR THE INDUSTRY. It is in order that this need may be met, as adequately as possible, that MODERN IRRIGATION presents this current "Buyer's Guide to Leading Supply Sources," *corrected monthly.* It will, of course, become more complete as the publication grows in size. But since the present advertisers manufacture—or act as selling agents—for virtually all standard types of hydraulic equipment, this department should, at the outset, perform an invaluable service to buyers and sellers alike. The importance to the individual manufacturer of keeping his listings accurate and up-to-the-minute cannot be over-emphasized. Changes and corrections should be forwarded immediately. If any errors or omissions are noted in this month's listings, make sure that such incorrect listing will not appear again by sending your correction or revision by the next return mail. The listings "Main Branches or Agencies" are for branch offices or distributors in the irrigation country only and do not imply, necessarily, that the advertiser does not have branches elsewhere which are not included here.

Commercial Iron Works

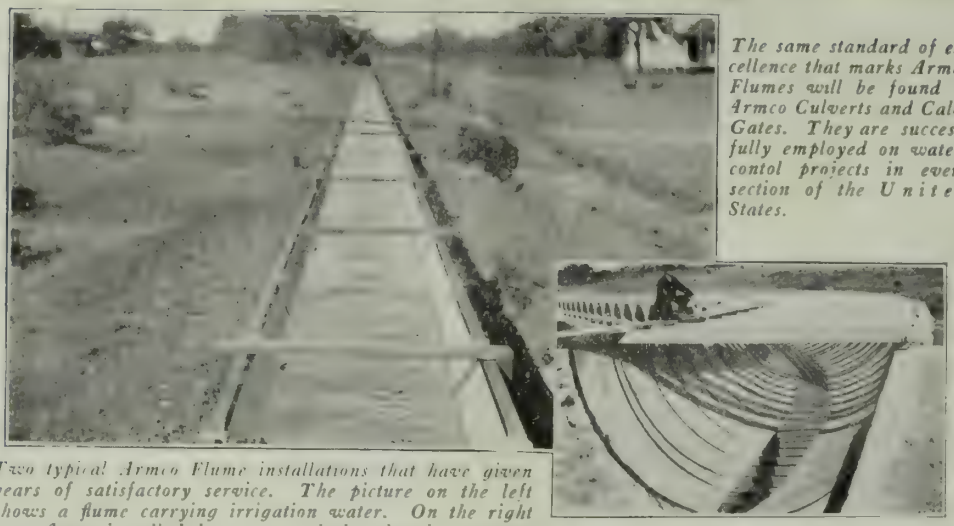
of Los Angeles

2424 PORTER STREET

[Near Ninth and Santa Fe Avenue]

LOS ANGELES, CALIF.



Two typical Armco Flume installations that have given years of satisfactory service. The picture on the left shows a flume carrying irrigation water. On the right is a flume installed by a great hydro-electric company in the mountains of California.

The same standard of excellence that marks Armco Flumes will be found in Armco Culverts and Calco Gates. They are successfully employed on water-contol projects in every section of the United States.

Make sure that *all* the water gets there —*use* Armco Flumes

A flume should be thought of as equipment for the delivery of water. In that light, leaky, wasteful flumes are as obviously unsatisfactory as a delivery truck that bounces out part of its load on every trip.

Armco (Lennon Type) Flumes are so designed that they deliver all the water entrusted to them, year after year with a minimum of expense and "time-out" for maintenance or repairs.

They embody modern improvements which add strength, increase carrying capacity and give uninterrupted flow. The flume sheets are made of Armco Ingot Iron . . . the purest iron practically obtainable, . . . covered with a heavy coating of galvanizing. This insures their ability to withstand the attacks of rust and corrosion.

Back of every Armco Flume stands the reputation and the guarantee of the California Corrugated Culvert Company, . . . a company that has for many years concentrated its efforts on the manufacture of unexcelled water-control equipment.

We will gladly send you detailed information and prices on Armco Flumes. You are invited to submit your problem to our engineers for helpful suggestions or assistance.

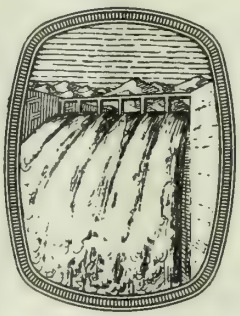
PETROLEUM WORLD 626 S. SPRING ST., LOS ANGELES, CALIF. MODERN IRRIGATION

ARTHUR S. BENT

President of Bent Brothers, Los Angeles contracting firm whose activities touch hydraulic construction in many parts of the west. Mr. Bent, a former president of the Associated General Contractors of America, in January was chosen as president of the Los Angeles Chamber of Commerce, thus adding to an imposing record of service to his profession and his community the distinction of directing the largest commercial civic organization in the world.

MODERN Irrigation

The Magazine of Applied Hydraulics



Volume II FEBRUARY, 1926 Number 2

The Progress *of* Irrigation

JANUARY, as it took its departure, brought to the farmers of California and the Pacific Coast a copious and welcome rainstorm, which will mean much to western agriculture. In Los Angeles a total of more than three inches was recorded in slightly over 24 hours. The same storm brought to Sacramento a precipitation of 2.82 inches; to San Jose 1.50 inches; to San Francisco 1.86 inches; and greater or lesser amounts fell over the entire area of the state.

It is difficult, perhaps, for one not familiar with the present rainfall situation and the climatological character of California to appreciate what this one storm may mean to the state. It must be remembered that California has suffered through three very dry years, and has looked to the present "wet season" for relief—relief which seemed, until January's timely storms, to be fatally delayed.

At the beginning of the year Edward Hyatt, Jr., Chief of the Division of Water Rights, remarked the critical nature of the rainfall situation in the state in these words:

"The cycle of dry years through which the State of California has been passing remains unbroken. . . . Out of a total of twelve typical California rainfall stations only two, San Diego and Bakersfield, have had more than a normal precipitation. . . . While it is too early to venture a prediction as to the 1926 season, it is worthy of note that particularly in northern California the outlook is very unfavorable. Southern California has been somewhat more favored than in 1924 in the matter of rainfall, but the situation is hardly more encouraging in view of the fact that in many sections, where wells are depended upon, the ground water is at the lowest known level."

A single storm, no matter how generous, can not restore the balance after a long dry cycle, but the January showers and the rains which have followed, early in February, have brought measureless values to the farmers of the state in the intrinsic values of the water, the vital storage provided by the attendant snows in the mountains, and the encouragement which they bring as harbingers of more rains to come during the next two months, during which a fair proportion of the seasonal fall may be expected. The situation is still serious, of course, in spite of these encouraging signs.

Probably just as important as the rainfall was the much-needed snowfall in the mountains which attended it. The western farmer has long since learned that an unusually deficient rainfall may be eked out, upon occasion, by extra irrigation, but lack of the resource from which that irrigation comes can not be humanly supplied. The snowfall in the mountains of California was in even worse case than the rainfall at the beginning of the year. An official Weather Bureau report in January declared:

"Snowfall in the mountains during December, as in the preceding month, was markedly deficient and the accumulated depths remaining on the ground at the close of the month were unimportant. A few stations reported depths on the ground ranging from eight inches to 'patches' but an overwhelming majority reported the ground as bare. As California is dependent for its summer water supply for irrigating and for hydro-electric power upon a generous supply of well-packed snow in the mountains, the outlook to date is not very bright."

In the storm at the end of January, the precipitation reported from various mountain points indicated that the seasonal snowfall has been brought to approximately ninety per cent of normal. Three to four feet of snow over the entire watershed of the San Joaquin River was reported by the Southern California Edison Company from observations taken at the top of Kaiser Mountain.

FEBRUARY first was a day of rejoicing in the Banta-Carbona Irrigation District, located on the west side of the great San Joaquin Valley in California. On that day the pumps were started by the district for actual irrigation operations. The Banta-Carbona district includes 15,000 acres of excellent land—not an enormous district, but certainly a considerable addition to California's irrigated area. Not long ago the landowners of this district decided they needed water; banded together under the state irrigation act, formed the district, issued $830,000 in bonds, which were promptly taken by investors and financial institutions of the state, and today they have an irrigation district, newly functioning, representative of a fine type of modern technical and financial planning and execution.

Irrigation is not dead. It makes its mistakes; but the continual growth of the healthy body is not materially hampered. Such indications as the completion of this irrigation system are encouraging signs.

A TABULATION of California hydro-electric power plants, released by the Federal Power Commission in January, and appearing elsewhere in this issue, is of much interest in what it shows of the increasing correlation of hydro-electric and irrigation developments in the state. These two phases of the appropriation of water resources are correlative and complementary, and in most cases, one of them is incomplete without the other; and this fact is being increasingly recognized.

The same report indicates that California continues to lead in hydro-electric developments as well as irrigation progress. Of all the applications for permits to appropriate water for power purposes filed with the Commission since its creation in 1920, a third have come from California; and almost half of the total capacity contemplated in the development projects authorized by the Commission has been included in these California permits involving the installation of more than 1,600,000 horse power.

During 1925 a gain of twenty per cent is shown in the horsepower capacity of hydro-electric installations in the state. The new energy made available in that year amounted to 326,000 horsepower. California is rapidly becoming an industrial state, and much of her agriculture, also, is becoming industrialized, with the result that there is a constantly growing demand for electric power, which will undoubtedly continue, for a long time to come, to accelerate the simultaneous development of additional water and water-power projects.

SERVICE is an over-worked word; but a real and tangible type of service is the keynote of a program adopted by the Western Irrigation Equipment Association at its January meeting, as outlined in an article in another part of this issue. Publicity to aid the irrigator and the irrigationist to solve most scientifically their irrigation pumping problems, to promote a knowledge of farm hydraulics in the schools, to extend to the farmer the valuable information which the association has compiled, and to make the public conscious of its dependence on irrigation as a fundamental resource, these are the objectives of the year's work which the association is taking up.

These are laudable purposes. In accomplishing them, or in accomplishing the first steps toward their realization, the W. I. E. A. will be performing a real service for its industry. Fortunately, the scope of the organization is such, and its relation to irrigation in California is of such a character, that in promoting these broad and general objectives, the association will be furthering its own interest—the sale of irrigation equipment. This, of course, is what it is intended to do, but its primary effect will be to benefit not only the association and its members, but the whole irrigation brotherhood, and the entire body of society which, without realizing it, has its foundation in the development and application of water.

LEFT (Above) — Fire-swept slopes are subject to severe erosion which makes it difficult to reclaim the land further. RIGHT (Above)—Erosion following fire is responsible for the removal of tons of material annually from the denuded slopes of southwestern hills.

LEFT (Below)—This photograph shows the catchment basin behind the San Dimas stream gauge where records of flood after fire were obtained. Note the silt beds just showing up as the water goes down, yet only a small part of this drainage area was burned off in the 1919 fire.

Fire and Water

A Story About Water Without a Dry Word in It; Concretely Tracing the Relation of These Two Enemies

By E. N. MUNNS

Chief, Office of Forest Experiment Stations, United States Forest Service

ACCIDENT and experience early taught man that fire and water were mutual enemies. Modern man, building upon this common knowledge, has developed his city fire suppression measures to such a point that he no longer analyzes the relationship between these two elements in nature.

There is, however, a further, less intimate relationship between fire and water. This relation is that existing between forest fires and irrigation water. Whereas water commonly extinguishes fire, it may be said that in this relationship the forest fire in a measure extinguishes water.

Probably in no section of the country is this relation between fire and water more clearly recognized than in Southern California, where the writer has conducted many investigations into the nature and extent of this connection. Indeed, those who are dependent upon the water from the San Bernardino and San Gabriel mountains, and those who have their property in the direct paths of the stream whose major drainage area lies in these mountain masses, recognize it most poignantly. With water and improved land increasing in value, they have seen these cultivated lands swept away as the result of forest fires and boulder-strewn gravel beds left in their wake; they have seen bridges, highways, and railroads destroyed and travel made well-nigh impossible; they have found a smaller summer runoff when water was most needed, and an ever-lowering water table in their wells.

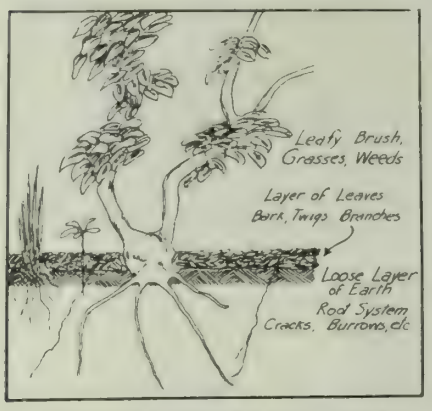
HOW THIS relationship works out is not always clearly understood, but investigations in the past ten years have disclosed many of the reasons. In the mountains of Southern California the principal soil cover is chaparral or brush rather than trees, a cover that is the result of the rather small annual rainfall, its limited distribution, and the long, warm, dry summer season.

The chaparral on typical slopes contains many thousand stems of many species, ranging in diameter from pencil size to four or five inches. The average of several small areas examined indicates that on some slopes as high as 32,000 stems are produced to the acre, or almost one to the square foot. Each stem of course produces leaves varying in quantity according to the species and the amount of light received, and each year a number of leaves about equal in number to the total number produced on the area fall to the ground, together with many small pieces of bark, twigs, and branches. Undisturbed, these accumulate and form a rough, more or less broken litter up to several inches thick. In the more open brush stands grow also numerous small weeds and grasses, which are usually inconspicuous except during the early spring, but which aid in forming the soil cover.

The combined effect of all the brush stems, the soil covering of leaves, twigs, and all plant growth, is to retard greatly the rapid movement of water down a mountain slope during a storm. This is accomplished in several ways. In the first place, a very high percentage of the precipitation runs down the stems directly into the ground and so tends to follow the roots into the soil. On the surface all rapid flow is reduced by the unevenness of the litter cover, while the cracks, crevices, and small plants permit the water to reach the soil without difficulty.

The retardation of surface flow is aided further by the absorption of water into the soil. Roots, both live and

decayed, assist in leading water into the deeper soil layers. The looseness of the top soil caused by frost and by the protection of the surface cover from sun, wind, and the heavy beating of rain, assists in water absorption and retention. Furthermore, with a good litter cover, insects of many kinds, worms, and even the larger ground dwellers, such as gophers and moles, dig and work the soil, aerate it, lighten it, and assist in



BEFORE THE FIRE HAS COME

mixing it to greater depths with the decaying litter, in such a way as to increase its water-holding capacity.

INVESTIGATIONS of the typical soil on a chaparral covered slope in the San Bernardino Mountains have indicated that the water-holding capacity of 100 pounds of soil was approximately 45 pounds or about 38 pounds of water per cubic foot of soil. Theoretically then, each square foot of soil is capable of holding the water obtained from a storm whose total precipitation is nine inches, without loss from runoff.*

But, let us consider the same area after it has been burned over. Very few brush stems will be left and these probably bare of leaves. All the litter will have been consumed and the soil surface exposed. The small plant life will be destroyed. There is now nothing to prevent the rapid runoff of the water, nothing to check its flow, nothing to assist the soil to absorb the water. There is little left but the bare soil with its light covering of ashes. At the time of the heavy rains the water sweeps down the slope unchecked. The ashes make a slime which seals the soil openings and greatly retards what little soil absorption is possible. The rain falling on the bare soil packs it harder and harder and tends to render it impervious.

*It should be remembered that the data given here are based upon a loamy clay soil derived from granite composition and supporting a mixed chaparral cover of oak, *Ceanothus*, manzanitas, etc. Other soils would undoubtedly not give the same results.

Did the fire hurt the soil? Did it reduce its water-holding capacity? The answer is that it did. The humus, which is more abundant in the surface layer of soil, and which assists greatly in increasing the water-holding capacity is largely burned out by the fire, while the top soil itself is baked by the heat and its physical composition changed for the worse.

UPON examination we find that the fire reduced the water-holding capacity of a cubic foot of soil from 45 per cent to 15 per cent, so that this cubic foot now holds but about 12 pounds of water. Translated into terms of rainfall, the soil could now hold theoretically but 3 inches of rain instead of 9 as before, leaving 6 inches to run off the area as flood water. Under actual conditions, of course, the amount of water absorbed by the soil at any one time depends in large measure upon the rate of rainfall.

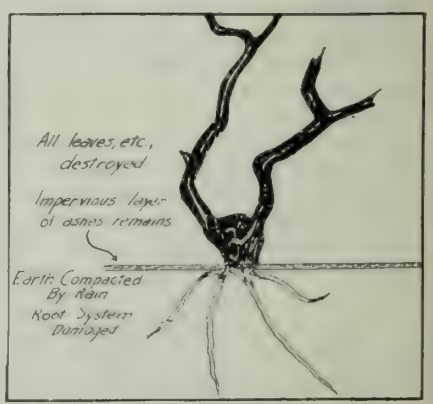
Much of this reduction in water-holding capacity may be ascribed directly to the fire by both consuming the material or by direct heat action converting the material into gases which were either consumed or passed off in the smoke. The action of fire was further supplemented by erosion. All of these factors work together. Studies indicate that the direct result of fire is to reduce the humus content from 16.48 per cent to 12.38 per cent, which in the 3 years following was further reduced to 6.42 per cent by erosion and the action of the sun.

The loss of two-thirds of the precipitation in the sudden run-off is a serious matter. In the first place, the floods occasioned by this heavy run-off are much heavier, longer, and more destructive than the floods from similar areas with uniform cover. The loss of this water also is responsible in part for the decrease in the level of the under-ground water, for the reservoir has no opportunity to replenish itself. Then too, the loss of this water means that there is less available on the area to support the vegetation which comes up after the burn or to appear in the later low-water flows.

There is a further loss, the loss of soil from the area. Under cover conditions, the water does not have the opportunity to collect in very large quantities or to flow in any large amount except in channels formed by repeated action. On the burned area, the water collects in every depression, gathers in every rill and run, and in a short time attains sufficient velocity to cut its own channel wherever it pleases. In these channels as it progresses down the slope the water increases in volume, and with increased volume attains a greater force. As is generally known, the carrying capacity of water increases rapidly with the increase in velocity, so that not only does each little run of water cut deeply into the soil, but it also carries off with it quantities of soil, to be deposited further down the slope.

IN THE first flow after the fire, the water carries off much of the ashes, and with this much of the valuable salts which are dissolved out of the ash. With these ashes the finer humus particles from the top soil, when not destroyed by fire, the charcoal and unburned material which would later break down and so add to the humus of the soil, are also washed away. At the same time are carried away the very fine soil particles, the colloids or silt material which are often the life of the soil. The water collected during these floods is heavy with silt. With all this material are smaller particles of soil and earth, to which are added, as the velocity of the water increases, sand, gravel, and small sized rocks.

How much material is brought down during a flood flow from a burned-over area is difficult to estimate because of the differences in topography, soil, and



AFTER THE FIRE HAS PASSED

precipitation conditions. From a burned area of 1.2 square miles in Haines Canyon, engineers estimate that 100,000 cubic yards were moved by the storms of the winter following the fire of 1914. Erosion from the burned areas in San Gabriel and Dalton Canyons in 1919, following the big fire of that year, was not as severe but probably equalled 75,000 cubic yards during the winter. Studies indicate that from 10 to 120 cubic yards of material per acre of burned area were moved. At various times it has been estimated that nearly 1,000,000 cubic yards have been removed from the denuded slopes of the Los Angeles and San Gabriel River drainages since the destructive fires of October, 1919,

(*Continued on Page 43*)

How Water is Controlled and Administered in a State That has Plenty of It

By R. K. TIFFANY*

State Supervisor of Hydraulics, State of Washington

Although Washington has bountiful water resources, thousands of acres of desert land are awaiting the development of these resources for their reclamation.

NATURE has been kind to the commonwealth of Washington in her bestowal of the resources essential to human health and happiness, and in nothing has she been more lavish than in the bountiful supply of water.

In thinking of its many uses our minds turn readily to the sparkling streams that furnish cities and towns with the pure water necessary for the many uses of home, civic and industrial life; to the magnificent harbors through which we receive products of every clime, and in turn reach with our products the markets of the world; to the falling streams which, through the magic of the engineer, furnish us with light and power to brighten our lives and lighten our burdens; to the artificial rivers that make the desert blossom as the rose; to the many beautiful lakes that afford us pleasure, recreation, yes, even inspiration in our leisure hours.

BUT, in the face of all these and many other important uses, it was not until 1917 that the people of Washington realized the necessity of orderly control and regulation of their water resources, and enacted what has since been known as the "Water Code" of the state.

The Water Code of Washington follows closely that of her sister state, Oregon, and the basic principles laid down many years ago by Dr. Mead in the water code of Wyoming, one of the first western states to substitute by statute the doctrine of appropriation for the old and generally accepted one of reparian rights.

It establishes police control by the State of all waters within the State and public ownership of all waters subject to rights existing at the time of its passage, and that any right to such waters or their use shall be acquired only by appropriation as by statute provided. While it specifically saves existing rights of riparian owners it provides that their amount and priority may be determined by proceedings under the statute, and owners and claimants of important riparian rights have found it desirable, in undertaking substantial development, to proceed under the plan of appropriation provided by the code rather than to rely upon intangible and uncertain rights which might accrue through riparian ownership.

The Code provided for administration through a State Hydraulics Engineer. This office was abolished by the Administrative Code of 1921, and its duties taken over by the State Supervisor of Hydraulics under the newly created Department of Conservation and Development.

The principal purposes of the Code are set out in the duties of the office as follows:

1.—To supervise public waters within the State, their appropriation, diversion and use.

2.—Insofar as may be necessary to assure safety to life or property, to inspect the construction of dams and other structures pertaining to the use of water.

3.—To regulate and control the diversion of water in accordance with established rights.

4.—To determine the discharge of streams, springs and other sources of water supply and the capacity of storage reservoirs.

5.—To keep proper records of water rights and issue certificates thereof.

6.—In conjunction with the courts to determine the relative rights and priorities of users of water.

New rights are acquired by procedure common to several western states, through filing of application with the State Supervisor of Hydraulics and publication of statutory notice. Examination is then made to determine whether there is public water available and whether the proposed use will impair existing rights or be detrimental to public welfare; and if satisfied on these points, permit is issued.

Where the proposed use conflicts with existing rights *or threatens to prove detrimental to public interest having due regard to the highest feasible use of the water belonging to the public,* it is the duty of the Supervisor of Hydraulics to reject the application.

PERMIT may issue for a lesser amount of water than that applied for if substantial reason therefor is found, but in no event shall permit issue for more.

In determining whether permit shall issue it is the duty of the Supervisor *to investigate all facts relevant and material to the application.* It would appear that taken with the repeated reference to public welfare and public interest, this provision should be construed to require investigation of such matters as the financial ability and experience of the applicant to carry out the proposed development. With increasing demand for economical power sites this phase of investigation assumes great importance. Irresponsible and incapable speculators should not be permitted to make filings that will prevent or delay real development.

Proceedings to determine existing rights may be initiated by petition of interested parties or by the Supervisor if, on investigation, he determines that the interest of the public will be served by the determination of water rights upon any stream or group of streams. Action is brought through the Superior Court, and all known claimants are made parties. Through the office of the Supervisor of Hydraulics, field examinations are made to determine the land irrigated and irrigable, canal capacities and locations, amount of stream flow, uses and rights for other purposes than irrigation and other facts, if any, bearing upon the case. A map and Statement of Facts are filed with the court, and all claimants are required to file statement of rights claimed by them, on forms furnished by the Supervisor.

*A paper delivered by the author at the third midyear meeting of the Western Division of the Chamber of Commerce of the United States, at Seattle, Washington.

The court then refers the proceedings to the Supervisor of Hydraulics to take testimony as referee. After all testimony is submitted it is carefully analyzed by the Supervisor and a report of his findings is made to the court, based upon testimony and the facts gathered through his office.

ALL PARTIES appearing before the referee are given an opportunity to examine his report and to file with the court exceptions thereto. Upon consideration of the report and of the exceptions, if any, the court finally issues a decree fixing the relative rights and priorities of all claimants, and water right certificates are issued by the Supervisor of Hydraulics in accordance with such decree.

The cost of all proceedings is assessed against the lands benefited, and payment of cost must be made before issuance of water right certificate.

The Supervisor of Hydraulics, acting through deputies, water masters and stream patrolmen, regulates diversions from streams in accordance with established rights. Salaries of the water masters are paid by the counties in which they are located. Stream patrolmen, operating under the direction of water masters, are paid for their services by the owners of lands directly benefited.

The builder of any proposed dam or controlling works for storage of more than ten acre-feet of water is required to submit to the Supervisor of Hydraulics plans and specifications for examination and approval as to its safety. With the organization of the Division of Water Resources limited as it is by available funds and so largely occupied by routine work in connection with the issuance of new and the determination of old water rights and stream regulations, this examination of plans is likely to be more or less perfunctory, particularly with reference to plans which are prepared by municipalities or large corporations having a capable engineering staff. Where the construction is in less experienced hands efforts are made to give all essential care both to the plans and specifications and to field inspection.

A nominal fee of $5.00 is required with all applications, this being called an "examination fee". It is insufficient to cover the actual cost of examinations, and a bill has been submitted to the legislature now in session, asking for a material increase in examination fees. It is hoped that this bill, if enacted into law, will have two desirable results; first, to increase the revenue of the office sufficiently to permit of adequate examination of all applications; second, to eliminate through a substantial charge, many filings made by irresponsible persons for purely speculative purposes.

Fees for filing of permits to appropriate water are:

For irrigation—10 cents per acre up to and including 100 acres; 5 cents per acre between 100 and 1000 acres; 2½ per acre for areas in excess of 1000 acres.

For power—10 cents for each theoretical hrosepower up to 100; 5 cents for each theoretical horsepower between 100 and 1000; and 1 cent for each theoretical horsepower in excess of 1000.

Washington has no annual license fee based upon the use of water, although some consideration has been given to the desirability of such a fee, sufficient only to cover the cost of operating the Division of Water Resources.

THE Code has been in effect since 1917, and in this period of eight years there have been filed 1550 applications for permits to appropriate waters; 594 permits have been issued; and 84 final Certificates of Water Right.

Under the provision for determination of old rights, 27 cases have been handled or are in process, covering 48 streams and involving 1705 water rights for the irrigation of 120,900 acres of land. Petitions are on file asking for determination of rights on 31 other streams. Certificates numbering 601 have been issued covering approximately 88,800 acres of land.

Under the provision for stream regulation, water masters in 11 counties have partly or wholly regulated diversion of water during the irrigation season from 63 streams.

The Division of Water Resources cooperates with the U. S. Geological Survey in stream gaging work on the major streams of the State. On the smaller streams miscellaneous measurements have been made, usually during the low water season, of some fifteen hundred only of the several thousand small streams within the State.

Washington has irrigation projects that have been investigated and found feasible for an aggregate area of 3,113,400 acres. More than half a million—575,400 acres—are now irrigated leaving approximately 2,538,000 acres for State development. The cost of these projects will be high, but with the high average returns established by existing projects, and with the rapid industrial and commercial development evidently in prospect for the entire Pacific Coast, it is believed that irrigation in Washington should and will proceed at a rate necessary to maintain a proper balance between agricultural production on one hand and commercial and industrial development on the other.

According to Dean Magnusson, Professor of Electrical Engineering at the University of Washington, we have within the State potential water power resources amounting to 8,647,000 horsepower, of which only 454,356 or 5.2 per cent has been developed. It is evident from these figures that the conservation and development of the water resources of Washington mean much to the State and nation, and that in the regulation and control of the waters of the State we have a public duty and a problem of present and ever-growing importance.

To Use San Marcos Creek

According to plans for a new irrigation district near San Diego, California, waters of the San Marcos Creek would be used to cultivate an area of 4000 acres. Application for permit to appropriate this water has been filed by R. E. Rule, engineer, of Coronado.

Albany Falls, on the Pend Oreille River, intake for the proposed Columbia River Basin project, (Washington).

Conserving and Controlling Western Waters

2-Land Settlement and Reclamation as Conservation Problems*

By FRANK ADAMS

Professor of Irrigation Investigations and Practice, College of Agriculture, University of California.

SINCE use is conceded to be the first step in the conservation and control of water, the construction of works of reclamation and the problems and policies connected with such construction likewise fall within the field.

The historical background of our present problems of western reclamation is well understood and need only be touched upon briefly. It is sufficient, probably, to say that we have learned how to do, and to do well, those things in reclamation that individuals and communities and even the Government can do singly, and henceforth must undertake our major reclamation in the West on the basis of wider relationships.

By this is meant that we must think in terms of the general situation in agriculture, including the markets for farm products, and the resultant effect of this general situation on the productive value of land; of the relation existing between arid land reclamation and reclamation of the unused lands of the northeast, the swamp lands of the south, the unused cut-over lands of the northcentral and northwestern states, and the productive but naturally wet lands scattered throughout the country that need drainage; of inter-state water compacts; of how we are to finance works of reclamation too costly to be wholly paid for out of the returns from agriculture, but which have their ample justification in the general benefits they will create; and of how the resources of the State and Federal governments, of local communities, of irrigation or drainage or reclamation districts, of interested landowners, of credit agencies, and of industrial and commercial bodies can collectively be employed to the end that our reclamation activities shall conform to the principles of conservation that we acknowledge to be basic.

Obviously, the details of all of these questions can not even be referred to, much less discussed, in this brief article. It is desired, however, to discuss briefly, as strictly water conservation problems, the questions of land settlement and of a larger measure of state and government aid in reclamation financing. The first of these is pre-eminently a question of the present, and until it is solved we shall make very little real reclamation progress; the second looms as the next major reclamation problem to face and work out.

THE BEGINNING step in connection with land settlement is to recognize it as a problem. When one considers the persistence and sometimes even the bitterness with which attempts to meet this problem have been opposed, one almost feels inclined to look upon the recognition of its existence as more difficult to bring about than its solution. However, we can not belittle the difficulties of the solution for we have not overcome them. We have not even begun to agree on a procedure for overcoming them. We should, however, be able to reach a common understanding on some of the underlying principles of the question, and with this in view the following are suggested:

(a) That the old idea that at least three settlers should fail before one can be expected to succeed is untenable from the standpoint of true conservation. It is not only a brutal conception, reeking with social injustice, but it is grossly uneconomic in its misapplication of effort and its dissipation of working capital.

(b) That the problems of settlement are more than the mere sale of land through the usual channels of real estate agencies, but, on the contrary, require and demand organization and planning before the works of a project are constructed.

The first responsibility in this organizing and planning is with the agency proposing a project; the second is with the community of which the project, when developed, is to become a part; the third, in the case of irrigation or reclamation districts, is with the State agency that approves or purchases the construction bonds.

There is little doubt that the above is fully recognized by the three states that have been extending direct financial aid to irrigation, reclamation, or drainage districts. It is not so clear that all of the other states yet recognize it. It is very certain that few who are proposing new projects have done so.

(c) That the number of prospective settlers who have sufficient working capital to establish a typical family farm and bring it to production without larger credit than is usually now available is too small to warrant reclamation construction at the rate prevalent during the past decade.

(d) That if the present or a more rapid rate of reclamation development is desired some agency—government, state, community, or individual—must supplement the inadequate capital of the usual settler.

The only plan for doing this thus far worked out is that of assisted settlement successfully in effect in some other countries, and under consideration for adoption by the State and Federal Governments in connection with development under the Reclamation Act.

(e) Finally, that the speculative differential between the value of land prior to the construction of irrigation works and the sale price to the farmer who is to complete the work of reclamation is the basic evil of all in Western conservation development.

DURING the past few years a feeling has been growing in the West that in some way the public must in the future bear a larger part of the cost of reclamation than heretofore. This is because the capital costs to farmers on irrigated land are increasing to the point of jeopardizing their success. The contribution from the Federal treasury has been considerable on the Government projects because no interest has been charged on deferred payments. This Contribution will be even greater under the revised plan of limiting required annual payments on construction to five per cent of the gross annual return to the settlers on the projects. There has been no contribution on district or private projects to balance this except as Oregon, Washington, and Wyoming have given temporary aid by the purchase of interest or principal of irrigation or drainage districts bonds, these advances to be later repaid to the States.

So long as reclamation costs are kept down to the amounts the returns from agriculture in the long run will justify, the question of introducing a form of public aid under which part of the capital cost would be contributed by the public is not likely to gain headway. Some even feel very strongly that the present Federal contribution, through not charging interest, should be eliminated, yet to change such a policy as this is not an easy matter in the face of certain strong western opposition. Now that the

*This article is the second and concluding instalment presented by MODERN IRRIGATION from Professor Adams' paper on "Conservation and Control of Western Waters" presented to the recent meeting of the Western Division of the Chamber of Commerce of the United States.

Building a *Dam* Marked for *Destruction*

Engineering Foundation Sponsors Experiment to Test Current Theories of Dam Construction

By FRED A. NOETZLI

ONE of the most interesting scientific tests ever conceived soon will be made not far from Fresno, California, when a full size test arch dam will be built for experimental purposes.

The object of the tests is to determine the distribution of the stresses in an arch dam under field conditions. It is believed that the experiments on the Test Dam will either confirm the correctness of one of the existing arch dam theories (cylinder or elastic arch theory) or lead to the development of a new theory upon which the design of future arch dams can safely be based.

There has been a demand for lower cost of dams while conserving safety and permanency, for power development, water supply, irrigation and flood control. Engineers have therefore tried to design and build dams of arch and multiple arch type, using less material than the old type of gravity dam. Some of the arch dams built are very thick, others very thin. Either there has been a waste of material in the thick dams or the limit of safety has been closely approached in the thinnest.

In an endeavor to get more knowledge on this subject The Engineering Foundation of New York in 1922 named a committee of engineers to undertake a study of arch and multiple arch dams. During the past three years a number of service dams have been equipped with suitable instruments for measuring deflections, stresses, temperature changes, etc., and observations are being made periodically on these dams.

Furthermore, a fund has been collected for building an experimental arch dam comparable in size to a number of existing dams. The Southern California Edison Company offered a large contribution and the use of remarkably suitable facilities at a site on Stevenson Creek, about sixty miles east of Fresno, California. At this site the dam is now under construction and may be safely tested to destruction, if possible. The dam will first be built to a height of 60 feet and tested repeatedly under a variety of load and temperature conditions for about one year. In the event that the dam does not fail at the height of 60 feet, it may be raised in steps of 10 feet each to a height of about 100 feet, when the water pressure will probably be so large as to crush the dam. The proposed experiments will be made under field conditions. Deductions will be carefully drawn from the test data by the Committee in charge of investigation.

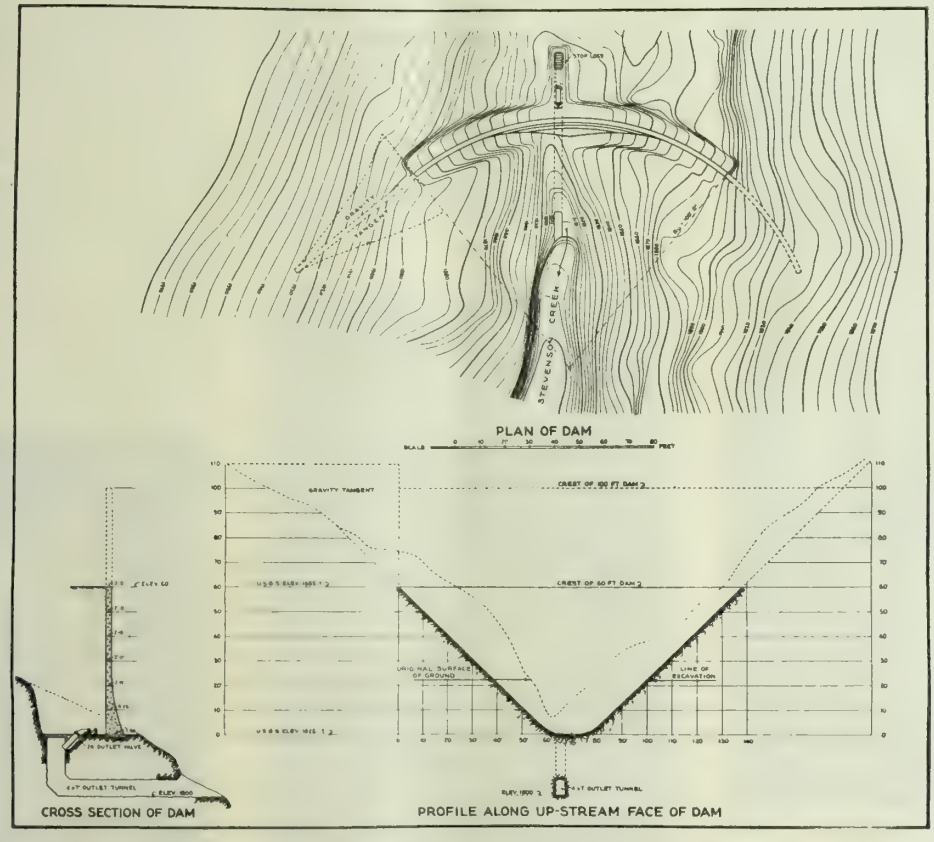
BUILT only to be destroyed—that is the fate of a dam to be built for experimental purposes on a site near Fresno, California, shown in the illustration above. Construction and hydraulic engineers expect that the tests to be made in this connection may reveal new and extremely valuable data touching existing theories of dam construction.

The test dam on Stevenson creek is an arch dam of the simplest type. The up-stream face is vertical, and the up-stream radius is 100 feet. The dam is 7.5 feet thick at base and 2 feet thick at Elevation 30 and above. The bedrock was excavated on both side abutments so as to provide a symmetrical profile. This arrangement will tend to avoid any complications that might arise from irregular profile, variable arch radius, etc.

The site on Stevenson Creek is remarkably favorable for the construction of the test dam. The foundation conditions are excellent, the bedrock being solid granite. The span of the dam is about 20 feet at the base and about 125 feet at a height of 60 feet above the foundation. The dam and reservoir are located entirely upon government land. The natural flow of Stevenson creek is diverted a few miles above the dam site. A power tunnel of the Southern California Edison Company passes just above the dam site and an adit to this tunnel equipped with a valve will permit of filling the reservoir in a very short time. The capacity of the reservoir behind a dam 60 feet high is less than 5 acre feet. These exceedingly favorable conditions will offer perfect control of the height of water in the reservoir without depending on or being influenced by the natural flow of the creek.

It is proposed to build the dam first to a height of 60 feet and test it repeatedly under various load and temperature conditions in the course of about one

year. During the construction of the dam a large number of instruments for measuring strains, temperature variations and deflections are being placed into the concrete and at a large number of points on the up-stream and down-stream side of the dam. The Bureau of Standards has developed a special instrument of the carbon resistor type which can be placed in the concrete or on the up-stream face of the dam below the water line, and which registers, by an electrical device, the strains which occur in the concrete under the loads imposed upon the dam. The strains will be measured at a large number of points in horizontal, vertical and inclined directions. The deflection of the arches at various elevations will be measured at the arch crowns and in several other vertical sections.



PLAN OF DAM
CREST OF 100 FT. DAM
CREST OF 60 FT. DAM
ORIGINAL SURFACE OF GROUND
LINE OF EXCAVATION
CROSS SECTION OF DAM
PROFILE ALONG UP-STREAM FACE OF DAM

Plan, Cross-section and Profile of Test Dam to be Tested to Destruction by Engineering Foundation's Committee on Arch-Dam Investigations.

WHILE the Test Dam is being built there will be cast a large number of specimens from the batches of concrete for the purpose of making laboratory tests. Some of these tests will be made in a room near the dam. For more refined tests specimens will be sent to the Engineering Laboratory of the University of California in Berkeley.

The Committee on Arch Dam Investigation, under whose direction and supervision these experiments will be conducted, consists of the following members:

Chas. D. Marx, Chairman, Professor Emeritus, Stanford University, California; Fred A. Noetzli, Secretary, Consulting Engineer, 928 Central Building, Los Angeles, California; Professor C. Derleth, Jr., University of California, Berkeley, California; (Alternate: Professor R. E. Davis, University of California, Berkeley); F. E. Weymouth, formerly Chief Engineer, U. S. Bureau of Reclamation, Denver, now President, Brock & Weymouth, Inc., Philadelphia; (Alternate: Julian Hinds, Research Engineer, U. S. Bureau of Reclamation, Denver); W. F. McClure, State Engineer of California, Sacramento; (Alternate: Paul Bailey, Deputy State Engineer, Sacramento); M. M. O'Shaughnessy, City Engineer, San Francisco; (Alternate: R. P. McIntosh, Designing Engineer, San Francisco); H. Hobart Porter, Sanderson & Porter, New York; (Alternate: Wynn Meredith, of Sanderson & Porter, San Francisco); Silas H. Woodward, Consulting Engineer, New York; H. Hawgood, Consulting Engineer, Los Angeles; D. C. Henny, Consulting Engineer, Portland, Oregon; H. W. Dennis, Construction Engineer, Southern California Edison Company, Los Angeles; Alfred D. Flinn, Director, Engineering Foundation, (formerly Deputy Chief Engineer, Catskill Aqueduct).

H. Hawgood is Chairman of the subcommittee of the Test Dam, and H. W. Dennis is in charge of the construction of the dam. W. A. Brackenridge, Senior vice-president Southern California Edison Company, Los Angeles, is trustee of the fund for the Test Dam.

RECOGNIZING that the direct and indirect results of this investigation will be of broad general value, Dr. George K. Burgess, Director of the Bureau of Standards, has assigned W. A. Slater, Engineer Physicist and well known experimenter in concrete, to have resident charge for the committee. The Bureau is also contributing the services of other members of its staff in its laboratory at Washington and in the field. Similarly, the Coast & Geodetic Survey is contributing the use of instruments and men. Funds, materials and services have been contributed by more than 40 power companies, construction firms, bankers, engineers, manufacturers and others. Contributions have ranged from $500 to $25,000. To date about $78,000 have been contributed to the Test Dam Fund.

The dam will probably be completed next March. Tests are being made during the entire construction period. The first experiments with the dam under pressure will be made as soon as the concrete has sufficiently hardened to carry the load imposed upon it by the water in the reservoir.

SNOW FALL HEAVY IN MOUNTAINS

Irrigationists in California who have been watching with deep concern the reports of snow falls in the high Sierras, were heartened by the welcome additions to snow accumulations recorded during February, beginning with the considerable storm early in the month.

On February 12, as this magazine went to press, current reports from the Southern California Edison Company's observers at Huntington Lake and other points in the Big Creek district indicated that practically normal snow conditions had been restored by the February storms in that section.

Sixty-eight inches of snow were reported on the level at Huntington Lake, which has an elevation of 7000 feet; and at the 5000 foot levels more than a foot of snow was on the ground.

According to officials of the Edison Company, the complexion of the outlook for snowfall has changed entirely within the month, practically normal conditions having been restored, and the outlook for the year being distinctly encouraging. Similar reports were received from various mountain points. There was three feet of snow at Big Bear.

New Members from Three States Accept Places on Magazine's Corps of Advisors

Arizona, Oregon and Idaho Represented by Three Authorities Newly Added to Editorial Board

PART of the plan upon which MODERN IRRIGATION was launched was the enlistment of a Board of Editorial Advisors, representing the leadership of various divisions of the hydraulic industry, whose interest in

W. G. SWENDSEN

the magazine would be at once an evidence of the solidity of the principles upon which it was established, and a guarantee of its direction in constructive and well considered channels.

The advisors who comprised the board in the beginning were, without exception, California men, although many of these hold places of national and international prominence in irrigation. There was a definite reason why only California men were selected for invitation. It was the purpose of the publishers to enlist, not only the names of the board members, but their actual, active interest and enthusiasm, based upon confidence in the need for the magazine and its capacity for meeting that need. For this reason, only those men who could be seen personally were invited to become members of the original board.

Now, however, commencing the second volume of the publication, MODERN IRRIGATION intends to extend the personnel of its Board of Advisors to an area coextensive with its avowed field of service—the entire western United States. Representatives of the irrigation industry's leadership in various sections of this territory are being invited to join the Board of Advisors. Their acceptance will be announced, and they will be presented, by word and picture, in future issues of the magazine.

In this issue, it is the publishers' privilege to introduce three well known irrigationists who have accepted membership

W. L. POWERS

on this Board: G. E. P. Smith, of Arizona; W. L. Powers, of Oregon, and W. G. Swendsen, of Idaho.

Warren G. Swendsen

The professional career of Warren G. Swendsen has brought him into intimate contact with hydraulic developments in many parts of the country, especially in the northwest, where he is now an acknowledged authority as State Engineer and Commissioner of Reclamation of the state of Idaho.

He was graduated from Utah Agricultural College in 1903 with the degree of Bachelor of Science in Civil Engineering. His early experience was gained with the Federal Reclamation Service in Utah and Idaho. From 1907 to 1910 he was in the employ of the Telluride Power Company as construction engineer, directing the design and construction of hydro-electric plants in Idaho, Utah and Colorado. For four years following he engaged in private practice with headquarters at Boise, Idaho.

The work in which he was engaged during this period included the planning and construction of irrigation projects, power plants and other hydraulic works in Idaho, Utah, Nevada, California and Oregon. In 1914 and 1915 he removed to the south, where he devoted himself to drainage work, with headquarters in New Orleans, but in the latter year he was recalled to the northwest to serve the joint Utilities Commissions of Idaho

G. E. P. SMITH

and Washington in expert appraisal work. In 1917 he again returned to private practice, doing general consulting work in irrigation and other hydraulic problems.

In 1919 he assumed the position which he now holds as State Engineer and Commissioner of Reclamation of Idaho. In this office he has statutory jurisdiction over all matters pertaining to the development and use of public water, dams, and construction of irrigation and power works. He was collaborating sanitary engineer for the U. S. Public

What Irrigation Has Done For My State—*IDAHO*

By ADDISON T. SMITH

MR. SMITH is Congressman from Idaho, and chairman of the House Committee on Irrigation and Reclamation. His is the first of a series of articles to be presented in MODERN IRRIGATION, *in which eminent westerners will tell what irrigation has meant to their respective states.*

IRRIGATION has meant much to Idaho. In 1860 the irrigated area of the state comprised but 1931 acres with an aggregate value of about $50,000.

In 1920 there were 2,489,000 acres, comprising more than 25,000 individual farm units under irrigation, with a value of farm lands alone of $360,000,000. During this period Idaho's population increased from 15,000 to 432,000.

The cost of constructing the irrigation works to cover the area under irrigation in 1920 was approximately $9,500,000. When it is remembered that the $360,000,000 valuation does not include the value of city, town, village, municipal and other property values, to say nothing of the homes which have brought contentment and happiness to thousands of people, this investment in irrigation, from a purely commercial standpoint, demonstrates an abiding faith in Idaho's destiny.

The revenue from this irrigated area is reflected in the 1922 census records, which show a crop value from these lands of more than seventy millions of dollars. Over 200,000 people are provided with employment in the various activities incident to the use and cultivation of this area.

JUST as the building of the first irrigation works, and the first use of water on Idaho soil in 1860, marked an epoch in the history of the development of the territory, the building of the American Falls reservoir, now under construction in southern Idaho, marks an epoch in the state's history.

When completed, about two years hence, this project will impound approximately 1,700,000 acre-feet of the flow of the Snake River, capable of affording a supplemental supply of water to enable the settlers already on the land to irrigate about 1,500,000 acres of the richest and most productive soil in the world.

Confronted with a cost of about $7,000,000 the farmers of this section, by an overwhelming vote at an election called for the purpose, favored a bond issue to finance the project. The initial $2,700 000 bonds of the district are secured by a total property value of more than $83,000,000.

FOR MANY years it has been the hope of settlers of the Snake River Valley that the building of this project would some day be consummated. The undertaking has been surrounded by obstacles that seemed insurmountable. But these sturdy men and women never lost faith.

Shortage of water upon smaller projects in the valley, followed by several seasons of drouth, stimulated the desire for additional water storage. These same people are now viewing the near-realization of their fondest hopes. Figuratively, it is a case of supplanting the sage with the rose.

After investigations and surveys it was found that the most feasible location for this great reservoir included the site occupied by the thriving town of American Falls. This problem seemed easy of solution compared with other obstacles that for years confronted the resolute settlers.

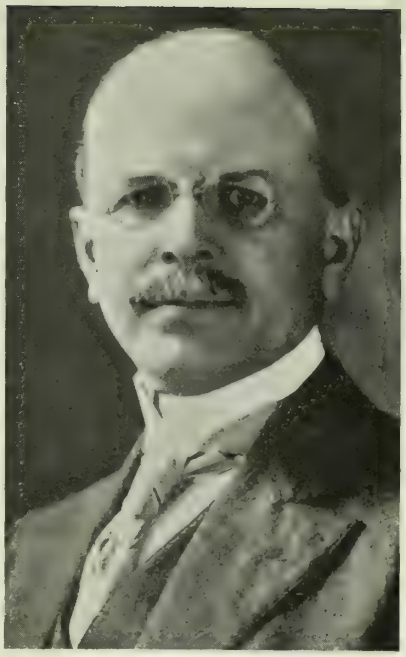
A new townsite was selected, on which has been planned a beautiful modern city. The old townsite, as part of the dam, will be completely inundated with water.

The American Falls reservoir district is a municipal, or quasimunicipal organization, created under the provisions of the Idaho irrigation district laws. Comprised in this one district are more than 400,000 acres of land situated in the Snake River Valley, the district controlling the existing irrigation systems between Idaho Falls and King Hill.

PRIOR to the organization of this district, extensive investigations were carried on by various irrigation companies, the State of Idaho, and the Bureau of Reclamation, looking to the construction of additional storage facilities for the regulation of the Snake River flow in the interest of irrigation.

As a result of these studies it was found that the American Falls reservoir site was the most advantageous of any of the sites in the watershed.

In order to co-ordinate the various interests seeking additional water, and to facilitate the construction of this reservoir, the Reclamation Service has, under authority of Congress, entered into



ADDISON T. SMITH

contracts with the various irrigation districts in the Snake River Valley in which it undertakes to construct a reservoir at American Falls for the joint use and benefit of the several districts and the Government's proposed Minidoka extension project, covering approximately 115,000 acres of undeveloped land.

Prior to May, 1923, the Federal Government had expended about $500,000 on the enterprise, and virtually no funds had been contributed by private interests.

There are probably 15,000 acres of new irrigable land within the trading radius of American Falls. These, if developed to capacity, would involve a maximum influx of urban population of from 1500 to 2000 people.

IT WILL probably develop, eventually, that the greater part of the irrigable lands in the vicinity of American Falls will be given over to the intensive production of potatoes, and the necessary alternating crops.

The soil of Southern Idaho is so well adapted to the prolific growing of sugar beets that every effort should be made to stimulate interest in this line of agricultural endeavor, especially as this country produces only about one-fifth the sugar consumed by its large population.

In the opinion of the writer the time is not far distant when capital in abundance will be seeking investment in the beet-sugar industry of the West; and with the completion of the American Falls dam, providing ideal conditions for the growing of sugar beets, Southern Idaho will take her place among the big sugar producing areas of the country.

VOL. II FEBRUARY, 1926 No. 2

The Scientific Spirit

THE OBSERVER of the water development industry, through its several divisions, can not fail to be struck by a distinctive characteristic. To a degree shared by few fields of commercial and industrial endeavor, the men concerned in the development and application of water supplies have a consciousness that they are involved in problems and responsibilities far more significant than the individual and his day's work.

In medicine, the same spirit is traditional. The physician studies the problems of disease in the distant ends of the earth, and follows the scientific advances of his profession, not for what such knowledge will bring to him, but for what use he can make out of it in behalf of the sufferers whom he attends.

In most of the sciences, the same attitude of progress, and of common concern in the problems and achievements of the profession, is apparent; but in most businesses it is not apparent. The financier studies the political and economic disturbances of the remote places, and makes note of the trivial things which may develop into significant factors in finance, it is true; but his motive is usually a selfish one. In irrigation, there is a general unselfish desire to learn about the interests, problems, failures and victories, of irrigation and hydraulic development in all parts of the country.

The Texan reads of the onward march of hydraulics in Idaho. The Californian reads of Colorado's progress. The Oregonian reads of great plans for development in Mexico.

So the irrigation industry, with its fundamental basis in a common task, is welded together. The advances of one section are made the achievements of all. The problem of a single part becomes the concern of all.

The Broad Outlook

Perhaps the explanation for the prevalence of this broad vision that goes beyond the limits of the particular task and the single organization, and takes in the larger aspects of water development, has its basis in the fact that the industry is technically based on an engineering science, and that all of its phases have thus come under the mental dominion of the engineer, whose education has trained him to relate the particular cog to the scope and purpose of the whole machine, and the particular function of the individual to the general problems of the whole industry. Or, possibly, it may be ascribed to the fact that water development is an outdoor profession, one that deals with the tangible and material stuff of nature; that the mind of the worker is irresistibly called back to origins and to primitive forces by the water that he brings from the mountains to the dam, and from the dam to the farm.

At any rate, whatever be the reason, it is a splendid and an inspiring thing that one may encounter in this industry. Each man has two concerns—the first, the day's work which he must discharge; the other, the general advance of the army of water development, whose movements he must note, with whose achievements he must keep pace, and whose problems he must understand and prepare to solve.

An Interesting Letter

AN interesting letter has come to the editor's desk. It is an invitation, addressed to MODERN IRRIGATION, for a representative of the magazine to attend a meeting of irrigation and hydraulic engineers, to speak to them about the plans and purposes of the publication.

"It occurred to me," says the writer of the letter, "that it would be interesting to this body to hear a short talk from you or some other representative of your magazine on the aims and purposes of your publication, and a statement on how you propose to meet the needs of the irrigation industry."

This letter is an expression of exactly that spirit of broad-view interest to which reference has been made. It is, of course, gratifying to the publishers of MODERN IRRIGATION that an organization of technical men should be desirous of hearing a statement of the pur-

POINT *Of* VIEW

poses of the magazine, but it is especially inspiring to realize that MODERN IRRIGATION has cast its lot in an industry where such a spirit is the rule rather than the exception—where men have a desire to know of the broad problems of the industry, and how they may be met.

Meeting Irrigation's Needs

ONE thought expressed by the writer of this letter may justify a brief additional comment. He is interested, he declares, in "how MODERN IRRIGATION proposes to meet the needs of the irrigation industry."

This magazine, of course, does not "propose to meet the needs of the irrigation industry," in the sense of prescribing for it a cureal that will overcome all its difficulties and banish all its ailments. If this body of engineers or any other organization that looks to MODERN IRRIGATION as a hopeful factor in the industry, expects it to expound some recondite formula in which may be found the secret for curing all the ills that irrigation flesh is heir to, it will be disappointed.

We do, however, conceive that the eventual working out of these needs of the irrigation industry may be immensely facilitated and expedited by such a magazine as MODERN IRRIGATION. The only organization capable of meeting the industry's needs exists within the industry itself, not in any outside source—neither legislation, nor journalism, nor government direction, nor experimental research, although all these things may contribute toward that end.

The function of such a publication as this is chiefly to place before the industry the means of self-expression in an organ that is to be peculiarly and exclusively the industry's own.

Is Reclamation Pork?

THE esteemed WORLD'S WORK, which has been quoted in this publication as a national magazine that realizes the importance of reclamation as a national issue, pays its respects to reclamation in the February issue in strong language. After pointing out that there are 6,000 reclamation project farms calling in vain for settlers, and that, at the same time, the Reclamation Service is "being bedeviled to construct several new projects," the magazine, in its editorial interpretation of the "March of Events" declares:

"The reclamation idea has fallen from its high estate of a piece of national statesmanship, of building new communities as new lands and their products are needed, to the low level of political pork, after the pattern of the old river and harbor bills. New lands are not needed at this time, the products of irrigated regions are temporarily a drug on the market, no settlers are crying for lands to buy. The only excuse for present extension of reclamation projects is that local interests need the money."

There may be some truth in what the magazine has to say, but, on the other hand, this brief editorial summing up of the situation is guilty of a fault too often to be descried in utterances prepared in New York editorial offices, several thousand miles from reclamation. Its origin is in a hasty generalization. Reclamation is too complex a matter to be measured by a foot-rule, or briefly dismissed in a column. "A reclamation problem," as such, has no existence. Reclamation presents a countless number of individual problems, with a different basis for each one.

Every project is a general grouping of smaller cases, not a case in itself. The individual ranch and the individual settlers must have individual consideration if we are to arrive at a proper understanding of their difficulties.

When the WORLD'S WORK tosses all reclamation expansion aside with a wave of its hand and says: "New lands are not needed at this time," it is assuming the dangerous prerogative of speaking in general and didactic terms for all the western states, with their great diversity of conditions, variety of products, and differences in experiences with reclamation. The matter may not be dealt with in that way.

The fact that reclamation is just this sort of a complex of varied problems is the prime factor in making it such a difficult matter to deal with. It is this fact, too, that gives the greatest force to the arguments of those who plead for a degree of decentralization not possible under the present system, and a share in control and responsibility by the individual states in which reclamation works are located.

A Reminder of a Debt

UNDER the lofty roof of an immense structure permanently devoted to this purpose, the Sixteenth National Orange Show, at San Bernardino, California, is in session from February 18 to 28th.

The gleaming piles of red-gold fruit, symbolic of the riches of Southern California, will bring home to tens of thousands of visitors their annual message of the bountiful endowments of this favored country, and how well these natural resources have been exploited.

How many of those who visit the Orange Show to admire the displays of "golden apples" will cast their imagination a step behind the glossy-leaved trees which bear the citrus fruit and see the dry, unproductive, sage-covered land that without irrigation could produce no fruit but a spiny cactus apple? The orange show, like any agricultural exhibit in the west, forms, for the thinking man, a monument to irrigation.

Fifteen million pieces of fruit, according to publicity matter circulated by the Orange Show, will be used in making the citrus displays. Fifteen million more evidences of the primary and fundamental value of irrigation!

Equipment Men Plan Service Program for Industry

Publicity and Educational Effort Have Big Place in Year's Work of Association

By HUGH CRANE

GATHERING in Los Angeles in the first business session of 1926, the Western Irrigation Equipment Association, in its January meeting, mapped out for itself a definite program of accomplishment for the year which, if followed out, will amply justify the association's purpose to be known as a real service organization for the industry.

The executive committee meeting on the morning of January 22, followed by the open meeting of the membership in the afternoon, and a banquet in the evening where business matters were forgotten and joy reigned unrefined, comprised a regular session of more than ordinary activity.

PUBLICITY and education are two new fields of endeavor to be entered by the Western Irrigation Equipment Association in 1926.

Under the leadership of C. B. Noyes, of the Sierra Machine Company, who heads the publicity committee, a publicity campaign is to be worked out that will make available through many sources the most valuable and accurate information on irrigation practices of the sort in which the association is interested.

Newspaper publicity, paid advertising space, the contribution of articles to technical journals, and other similar channels will be used in this effort. A monthly department in MODERN IRRIGATION, which has been designated the official publication of the association, is being considered. It is planned, also, to make the name and purposes of the organization better known by the adoption of an official trade-mark to be used on all literature issued by the W. I. E. A., and to be incorporated into an attractive lapel button for the use of members.

Envelope stuffers for the use of members in correspondence, the imprint of the association on members' letterheads, and all such methods of promotion will be consistently encouraged. Another constructive and helpful part of the publicity campaign will be the preparation of an improved and revised Data Book, on which a committee is now actively at work.

Schools, fairs and exhibits, bankers' organizations and farm bureaus will be used in the education campaign of the association. A course in farm hydraulics will be urged for inclusion in the high school curriculum, and catalogues and bulletins issued by the association and its members will be made available in high school libraries. Through co-operation with the state board of education and individual schools and teachers, it is expected that the association may obtain a degree of emphasis on an important phase of agricultural education that has never in the past been approached.

The close connection between irrigation and finance will be taken advantage of, by making direct appeals to bankers' meetings, both locally, and in state and regional conventions. The purpose of this effort will be not merely to encourage a mutual knowledge of problems between the bankers and the equipment manufacturers and dealers, but to facilitate some form of practical co-operation in financing the purchase of irrigation equipment.

Through farm bureaus, a valuable contact with the individual user of equipment is at hand, and will be employed wherever possible, members of the association speaking at farm centers on technical and financial subjects connected with irrigation pumping.

The association will continue its efforts to secure adequate representation at fairs, and wherever practical will have literature for distribution at such exhibits, will maintain a helpful information bureau, and will conduct an irrigation display calculated to attract and hold the attention of the crowds.

SEVERAL important matters remain to be decided by the Association. The complex and difficult job of adopting a standard pumping inquiry and guarantee form has made progress, but has not yet been completed. Professor L. J. Fletcher, of the Agricultural Engineering Division of the University of California, attended the meeting and reported on this subject.

Another live issue before the organization is the question of whether or not pumps should be sold by manufacturers, or retailed exclusively through dealers. There will be keen interest in the discussion of this subject at the April meeting of the organization, to be held in Fresno.

According to a change in the constitution, adopted at the January session, the presidency of the W. I. E. A. is now a job of limited tenure, the new amendment providing that the President may hold office for one year only and shall not succeed himself.

C. F. ZIMANSKY

President, Western Irrigation Equipment Association.

MEMBERS of the association are looking forward with anticipation to the Fresno meeting, which will be held on Friday, April 16, in the building of the San Joaquin Light and Power Company, with A. M. Frost, salesmanager of the company, as chairman of the committee on arrangements.

An enjoyable feature of the January meeting was the banquet, at which informal and unprogrammed speeches were heard from many of the members in attendance. Frank P. O'Brien, of the industrial department of the Los Angeles Chamber of Commerce, was the speaker, tracing the industrial growth of the southwest in a convincing manner. Douglas G. McPhee, editor of MODERN IRRIGATION, served extemporaneously as toastmaster, and in addition to presiding gracefully over the speech-making, delivered an impromptu address of his own, telling the association members of the purposes and plans of the magazine which they recently designated as their own official publication.

Owen Brown, co-publisher of MODERN IRRIGATION, and the first honorary member of the W. I. E. A., was present and responded briefly but appropriately to his introduction to the organization.

Joseph H. Cox, J. E. Lundy, W. P. Custer, C. B. Noyes and others also responded extemporaneously with a smile and a cordial word when called upon by the toast-master.

THE HYDRAULIC DIGEST

A Monthly Bulletin Board of Brief Facts and Events from Far and Near

Revised Budget Adopted

The revised budget for 1926 adopted by the Imperial Irrigation District involves an expenditure of $2,904,050 during the year. The contemplated total is less by $98,634 than the actual total expenditures in 1924.

Tacoma Takes Over System

The city of Tacoma, Washington, has acquired, for a consideration of $50,000, the holdings and franchise of the North End Water Company. This transaction gives the city complete control of the service of water to the community.

Banta-Carbona Completed

The construction of the Banta-Carbona Irrigation District, near Tracy, California, was completed in February. Completion of the project brings 14,150 acres, practically all of which are cultivated, under irrigation. The cost of the project has been $820,000.

Use Planes in Survey

A valuation survey of the property of the Consolidated Water Company, of Pomona, California, including its mountain watershed, will be aided by the use of government airplanes, it has been announced by Seller & Latker, the engineering firm in charge of the valuation.

Exchequer Dam Complete Soon

The Exchequer dam and the large construction works which it has entailed will be completed on April 1, according to the report early in February to the directors of the Merced Irrigation District by R. V. Meikle, chief engineer.

Laguna Votes Bonds

Matching and surpassing its previous unanimous vote for the formation of a water district, Laguna Beach (California) set a new mark to shoot at in January when it recorded another unanimous vote in favor of issuing $600,000 in water bonds. The earlier vote in favor of forming a district was 359 to 0. The vote in favor of the bonds was 437 to 0.

Push Columbia Basin Project

Plans for Congressional approval of the Columbia River Basin project have not been abandoned, but are being vigorously pushed at Washington by officials of the Columbia Basin Irrigation League, who are hoping to arrange hearings before the senate committee on irrigation and reclamation.

New California District

A new irrigation district in Napa and Solano Counties (Calif.) is contemplated by an application filed with the state Division of Water Rights by W. S. Davisson, of Suisun, asking permit to appropriate 200 cubic feet a second and 10,000 acre feet a year from Suisun Creek, tributary to Suisun Bay.

Add Three Miles of Levees

Directors of the Imperial Irrigation District have authorized the extension of the present levee system of the district by three miles, along the west side of the Pescadero cut. The estimated cost of the work is $40,000 to $50,000, half of which is to be paid by the Colorado River Land Company.

Oceanside Plans Reservoir

The city of Oceanside, California, is planning to construct a three-million-gallon water storage reservoir, to serve 2000 acres recently added to the corporate area of the city. The present capacity of the reservoirs serving the city is 600,000 gallons. The small ranches added to the city by the inclusion of the additional acreage required the extra storage.

Irrigation Districts Body Meets at Merced March 11

The Irrigation Districts Association of California will hold its annual meeting at Merced on March 11, according to the announcement of W. D. Wagner, its secretary. The program will include inspection of the new Exchequer Dam and other works of the district.

To Deepen Reservoir

The storage capacity of the Lake Hodges reservoir of the city of San Diego, California, will be increased by 4,000,000,000 gallons, according to plans completed by the city council. The plan provides for installation of 14 radial flash gates in the spillways, which will raise the water level to near the top of the dam. Estimated cost is $50,000.

Yakima Sells Water Bonds

Yakima, Washington, sold two water bond issues in January. One issue, general obligation bonds, were purchased at par ($450,000) by the state of Washington, at 4½ per cent interest; while the larger issue, $1,050,000 was taken at $95.70 with 5½ per cent interest by a Seattle syndicate comprised by Burr, Conrad & Broom, Inc., Ballairgeon, Winslow & Co., W. P. Harper & Son, and the Seattle National Bank.

$3,000,000 Washington Project

A temporary permit was issued in January by R. K. Tiffany, state Supervisor of Hydraulics of the state of Washington, to R. W. Lincoln, of Portland, Oregon, authorizing a $3,000,000 water project on Toutle River. The applicant represents the Spirit Lake Railway & Power Company, which, it is announced, plans to start immediately on the construction of a concrete arch-dam 600 feet long and 110 feet high.

Form Protective Body

The Santa Clara River Protective Association, in which irrigationists of the Santa Clara River of the South (Ventura County, California) are associated, is seeking official incorporation. The organization has been formed for the protection of the water rights of the owners of 100,000 acres of land in Ventura County, all of which is irrigated from the underflow of the Santa Clara River. The association hopes to treat with the city of Los Angeles or other interests desirous of appropriating waters of the river, for the purpose of protecting the present water supply of its membership.

Ask Investigation of Acts of Reclamation Bureau

Klamath Irrigation District (Oregon) has gone to Congress with its grievances against the federal Bureau of Reclamation. In a communication addressed to Senators McNary and Stanfield, and Representatives Sinnott and Raker, the district petitions for an investigation of certain acts and decision of the Bureau to which objection has been made.

The alleged acts which the district particularly wishes investigated, according to the communication, are:

1. A contract, which the district asserts to be against public interest and the avowed policy of the government, whereby the California Oregon Power Company has acquired use of water from a government reservoir without charge, "and control of the main source of water supply of the Klamath project for a period of 50 years."

2. Sale of two power canals to the same company "over the protest of the water users who owned or would own them, and for a vastly inadequate, a nominal compensation."

3. Alleged interference by the Bureau of Reclamation in the internal affairs of the district.

4. Asserted refusal to grant a moratorium on construction payments to the project after Congress had given authority for such action.

5. Alleged failure to allow the district the benefits of the Fact Finder Act.

6. Insertion of a clause in an operation and maintenance contract submitted by it to the district "which would, in effect, deprive the district of water rights of great value without compensation therefor."

7. The petition asks the privilege of showing the senate that the plans of the Reclamation Bureau will lose to the district at least 100,000 acres of its best land.

January Snowfall Records in Northwest Show Deficiency

Records of snowfall, received from various Pacific Coast points during January, indicated that the seasonal fall was considerably less than the normal at that time. At the beginning of the year the weather report issued by J. L. Lytel, superintendent for the United States Bureau of Reclamation at Yakima, Washington, estimated a snowfall of sixty-two per cent of normal over the entire watershed of that district. In Oregon, a similar condition is reported, with both rainfall and snowfall showing marked deficiencies.

Washington Irrigation Men Meet at Yakima

The Washington Irrigation Institute met at Yakima, Washington, on February 10 and 11, with state and national leaders of irrigation in attendance. A representative of the Bureau of Reclamation met with the Institute and discussed matters in which Washington, the state, and Washington, the federal capitol, are mutually interested. Senator D. V. Morthland and Representative Mark Moulton discussed state and federal reclamation policies, and irrigation experts spoke on various phases of irrigation management and financing.

Central Oregon District Reduces Obligations

Farm produce from the Central Oregon Irrigation District in 1925 amounted in gross value to $1,700,000, or approximately $59 per acre. The district, which includes an irrigable area of 45,497 acres, has reduced its indebtedness to approximately $4.00 per acre, and this is being gradually reduced. The district was organized in 1917, with 1200 land owners on the project. Its total bonded indebtedness amounts to $180,000, compared with an estimated farm value of more than three million dollars.

Conserving and Controlling Western Waters

(*Continued from Page 15*)

relatively lighter tasks in western irrigation reclamation have been very largely accomplished, however, and with some of the big water conservation projects of the future sure to bring on costly reconstructions and rearrangements of systems in accordance with comprehensive plans, direct public aid of a larger order of magnitude seems inevitable.

For example, the State Department of Public Works of California is now engaged in an investigation of the water resources of that State with a view to developing plans for their complete economic utilization. It is a foregone conclusion that some of the works that will be required will be of the nature of great public improvements for which the lands specifically benefited can not pay. Of a somewhat different order are the proposed great Columbia Basin project in Washington and the extensive works that will be involved in any development of the Colorado.

NO LACK on our part of proper irrigation and reclamation management can alone justify a call for increased public financial aid. Certainly such increased aid is not likely so long as the excessive costs to the farmer are due to land speculation or to inefficiency on our part in meeting the problems of settlement. But when, after some fair solution of our settlement problems has been effected, more irrigated or reclaimed land is needed and the farmer still can not earn the entire cost of reclamation, justification for increased public aid will be found in the general public benefits that will accrue from the reclamation, just as it has in numerous other countries.

In the case of such reorganizations and rearrangements as will be required in substituting comprehensive developments of entire stream systems or combinations of stream systems public aid is justified on the further ground that Society must pay for the mistakes of Society, or for the more costly of the changing conditions that render what is economic in one generation uneconomic in a later one.

Heretofore we have considered public aid in reclamation almost wholly as a Federal function, the only important exceptions being the three states extending assistance to irrigation, drainage, and reclamation district already mentioned. As a closing thought on this subject the suggestion is ventured that states financially able to help, and in which help is or will be needed, will in due time be giving careful consideration to their responsibility, for it is a rather well established principle that, in general, the Federal function is to do what the States can not. Perhaps our own chief function in the matter is, within our respective states, to stimulate thought on this subject that has a State-wide viewpoint.

Water Survey Report Ordered by San Francisco Mayor

Mayor James Rolph, Jr., of San Francisco, upon the receipt of a letter, during January, from the city health officer, warning, in gravest terms, of an impending water shortage, instructed City Engineer M. M. O'Shaunessy to make an immediate report on the water situation of the city. The letter of the health officer called the Mayor's attention to the fact that "San Francisco is facing a shortage of water, and no assurances, excepting heavy rainfall for the remainder of the season, can eliminate a grave menace to the public health."

Three steps were urged to be taken to remedy the shortage; wells to be sunk in the Richmond district; waste of water in sewers and street flushing to be discontinued, and substitution of salt water for fresh water in the fire-fighting system.

LAYKOLD
EMULSIFIED ASPHALT
TRADE MARK REG

Government Reports of an unusually light snowfall in the mountains indicate a serious shortage of water for irrigation use this summer. There has been little snowfall and it is too late now for the snow to pack sufficiently to insure a normal supply of water.

Since this is the case, it will be to the advantage of every district and individual to investigate now the matter of lining or relining ditches that have been wasting water in the past.

We have a message of interest to the entire irrigation industry. In later letters we will tell you more of our ditch-lining process—how rapidly it can be applied—how economical it is—how it conserves water, reclaims land, and saves crops.

But for the present we must center all of our attention on those who will need assistance & advice in their lining problems between now and the time when the water must be turned in.

From them we invite immediate correspondence, with the promise of an intelligent assistance based on a knowledge of their problems.

MANAGEMENT

STORING WATER FOR DOMESTIC USE ON THE FARM*

WATER for domestic use on the farm may be stored in wood, steel, or masonry tanks, and to secure gravity delivery the tank must be elevated above all faucets. Tanks placed in attics, barn lofts, and upon light trestles are unsatisfactory. The objections relate to insecurity and leakage, lack of pressure, and unwholesomeness in summer and freezing in winter. Masonry tanks may be placed on a hill, silo, or masonry tower. Where possible, an underground concrete tank on a hill is very desirable, avoiding trouble with frost and giving a tempered and sure supply.

Tanks should hold more than one day's supply. For windmill supplies the requirements of a week or more may be needed at times. Tanks should be provided with a waste pipe and valve to facilitate emptying and cleaning, and without fail should be covered tightly for protection against heat, cold, dust, vermin, and sunlight. Where exposed to light, ground and filtered waters are liable to develop growths which impart objectionable odor, taste, or appearance.

Water may be stored and delivered to the faucet by use of a hydro-pneumatic (water-air) tank. The tank need not be elevated and usually is conveniently located in a utility room, basement, or cellar. Hydro-pneumatic tanks must be absolutely air-tight. Air, being lighter than water, occupies the upper portion of the tank, and it presses with increasing force against the water as either more water or more air is pumped into the tank. When air and water are under pressure the latter gradually absorbs the former, and this absorption is the more rapid the higher the pressure. From time to time, therefore, the air supply must be replenished, or the tank becomes water-logged.

Maintenance of the air supply is a vital factor. Inlet and outlet pipes must enter at the bottom of the tank. Hydro-pneumatic tanks are made of three-sixteenths inch or thicker steel with riveted and welded or calked joints. A range boiler or other thin-walled tank should not be used for this purpose. The smaller tanks generally are galvanized and may be set vertically or horizontally; the larger tanks are set horizontally.

TO OBTAIN the best service from a hydro-pneumatic tank it is necessary to carry an initial or excess air pressure; that is, enough air to give pressure when no water is in the tank. Table 1 shows what percentage, or fractional part, of any tank, either vertically or horizontally set, contains water under varying condition of gage pressure and initial air pressure.

tank is from one-fourth to one-third of its total capacity.

The farmer should outline his plans for the various parts of his system. Suppose a plant is desired to meet the needs of 5 persons, 25 cattle (including horses or mules), 50 sheep, and 50 hogs. The average daily requirements would be as follows:

	Gallons
5 persons at 40 gallons each	200
25 cattle at 12 gallons each	300
50 sheep at 1 gallon each	50
50 hogs at 1 gallon each	50
Total	600

TABLE 1

Quantity of water in fractional part of total capacity of any hydro-pneumatic tank (based on atmospheric pressure of 14.7 pounds to square inch):

Gage pressure (lbs.)	Initial air pressure in lbs. 0	5	10	15	20	25	Gage pressure (lbs.)	Initial air pressure in lbs. 0	5	10	15	20	25
5	0.25	....	....	....	....	....	45	0.75	0.67	0.59	0.50	0.42	0.34
10	.40	0.20	....	....	....	....	50	.77	.70	.62	.54	.46	.39
15	.51	.34	0.17	....	....	....	55	.79	.72	.65	.57	.50	.43
20	.58	.43	.29	.14	....	....	60	.80	.74	.67	.60	.54	.47
25	.63	.50	.38	.25	.13	....	65	.82	.75	.69	.63	.56	.50
30	.67	.56	.45	.34	.22	0.11	70	.83	.77	.71	.65	.59	.53
35	.70	.60	.50	.40	.30	.20	75	.84	.78	.72	.67	.61	.56
40	.73	.64	.55	.46	.37	.27	80	.85	.79	.74	.69	.63	.58

Table 1 has many uses. It shows that if water is pumped into a tank, having no pressure above that of the atmosphere, until the gage shows 5 pounds, the tank will be one-fourth (0.25) filled with water; at 15 pounds it will be about one-half (0.51) full; at 30 pounds it will be two-thirds (0.67) full; at 45 pounds it will be three-fourths (0.75) full; at 60 pounds it will be four-fifths (0.80) full.

An example will be helpful: Suppose a 200-gallon tank is half full of water under a gage pressure of 45 pounds, and it is desired to know what quantity can be drawn before the pressure reaches 25 pounds. Inspection of Table 1 shows that if half (0.50) full at 45 pounds the initial air pressure must be 15 pounds, and under that excess a tank is one-fourth (0.25) full at 25 pounds gage pressure. Therefore, 0.50 minus 0.25 equals 0.25, which, multiplied by 220, equals 55 gallons, the available quantity. In general the working capacity of a

A suction pump would be used with a shallow supply; a deep-well pump or set-length pump would be used with a deep supply. A suction pump probably would be located in a dry, frost-proof basement, pump house, pit, or underground concrete chamber opening into the house cellar. A deep-well pump probably would be outside of main buildings; if a pit or chamber, there should be a manhole over the center of the well to permit pulling up the pump rod and drop pipe.

TO DO the day's pumping in two hours would require a pump having a capacity of 300 gallons per hour or 5 gallons per minute. The more constant the power, the more reliable the equipment, and the more accessible the repair parts the less is the need of large water storage. An automatic electric-driven pump may have a pressure tank varying in capacity from 10 gallons upward. It would be arranged to start

PIPE

Both USED and NEW--At a SAVING to YOU!

WHENEVER and wherever you need pipe of any size or dimension, Pacific can serve you and save you money, too. For general farm and irrigation purposes, Pacific Reconditioned Casing is a real bargain. Absolutely guaranteed. Every length straight and clean with new threads and couplings, each protected from damage in shipping by special steel protectors.

Every length rattle-tested and steam pressure-tested as proof against weakness; then dipped in a special non-tasting hot asphaltum which resists alkali and corrosion. This adds years to its life. Nowhere else in the West, except in the Pacific plant, can used pipe be so thoroughly reconditioned and then sold at such low prices.

pumping when the pressure falls to 25 or 30 pounds. With very small tanks any considerable use of water starts the pump and delivers water by direct pump pressure.

The smaller pumps and tanks are especially useful for cistern and other household supplies, but the pump capacity (5 gallons per minute) figured in the example, would give fair discharge from one garden hose nozzle or two ordinary spray nozzles or two house faucets. Faster use of water would require a larger tank; a tank 30 inches in diameter by 6 feet long, 220 gallons capacity (water and air) should be sufficient for short heavy drafts, having a working capacity of approximately 50 gallons (oil barrel capacity) between the usual stopping and starting pressures noted above. If electric current cost 15 cents per kilowatt-hour the cost of pumping 600 gallons would approximate 14 cents per day.

A larger tank would be used if the pump were not automatic or were engine-driven. Under those circumstances a hydro-pneumatic tank 42 inches in diameter and 14 feet long, 1,000 gallons total capacity would be suitable. With 20 pounds initial air pressure, it would deliver 290 gallons between pressures 45 and 25 pounds. (See Table 1: 0.42 minus 0.13 equals 0.29, which, multiplied by 1,000, equals 290 gallons.) Hence it would be necessary to operate the pump twice a day. If an elevated tank were to be employed its capacity should be larger.

Three New Members for Advisory Board

(*Continued from Page 18*)

Health Service in Idaho from 1919 to 1925, in addition to his state duties.

W. L. Powers

W. L. Powers, Chief in Soils at the Oregon State Agricultural College, is a man who combines in rare measure the broad-view attitude of the academician, the scientific spirit of the research authority, and the practical knowledge and skill of the man who is in daily contact with the realities of irrigation problems.

He has been familiar with agricultural matters since boyhood, having grown up, as so many "westerners" have done, on a farm in the Middle West, and having come to the far-west to devote himself to the study of agricultural conditions on the Pacific Coast. His youth was spent in northern Illinois, and most of his undergraduate college work was done at the University of Illinois.

After his graduation Professor Powers spent two years with the New Mexico

Experiment Station, meeting the problems of agriculture on arid lands at first hand, and putting into practice some of the knowledge which his academic education had given him. His work was in irrigation and soil investigations. In 1909 he was called to Oregon and since that time has been with the Oregon Agricultural College at Corvallis. His work is in the Experiment Station, where he is contributing much to the knowledge and literature of his subject. He has published about twelve Experiment Station Bulletins dealing with reclamation, and a text book on Land Drainage. At the present time he is secretary of the Oregon Reclamation Congress and of the Oregon Drainage Congress, in both of which organizations his ability counts as a wise and constructive force. He is now a candidate for the Ph. D. degree at the University of California.

G. E. P. Smith

Another University man and research scientist whose practical achievements in irrigation have earned him the respect of the industry is G. E. P. Smith, irrigation engineer at the University of Arizona. Professor Smith was graduated from the University of Vermont in 1897, receiving the highly valued Phelps prize, and two years later received the degree of C. E. He was retained at that institution for three years as instructor in the engineering department. In 1900 he came to the University of Arizona, where he is now serving his twenty-sixth year. His more than a quarter century of service has seen epochal transitions in his adopted state, and in irrigation practices there and elsewhere, but probably no Arizonan has contributed more to the advance of successful irrigation than he. Since 1906, he has been professor of irrigation engineering and irrigation engineer of the Agricultural Experiment Station of the University.

Professor Smith has had various engineering connections and in later years has done consulting work, especially in irrigation lines. His investigations have included studies of groundwater supplies, the loss of groundwater by transpiration, caisson wells, pumping for irrigation, concrete pipe, and Colorado River problems. He is the author of a large number of bulletins and contributions to the technical press.

The development of pump irrigation in Arizona to its present status has been due in no small measure to his leadership. He is a member of the American Society of Civil Engineers, the American Association of Engineers, and is a fellow of the American Association for the Advancement of Science.

CLEARFLOW

Inclined Seat Check Valves

HYDRAULIC ENGINEERING

Dealing with the Practical Problems of the Operating and the Consulting Engineer

INTERPRETING ENGINEERING AS A FINE ART

"ENGINEERING a great project such as the Kings River Development is very much like writing a novel or play, painting a fine picture, or carving a great statue," says Sidney Green, in San Joaquin Power Magazine, of Fresno, California. The writer then goes on to show how the qualities demanded in the engineering of a great hydraulic project are essentially the same as those required by the artist.

The hydrographer making his rounds, measuring next summer's irrigation water, at an elevation of 8,000 feet, overlooking the west fork of King's River.

Back of all masterpieces in art and literature is the basic idea, the purpose of the work. Before the actual building of the work begins there must be gathered vast quantities of detail,—the result of research and observation by the creator. Facts and information must be assembled; speculation demanding imagination and judgment must be used to determine results in the event certain things are done. All must be thought out, revised, corrected and changed until the creator is satisfied that the work is what he wants.

The printing of a book, the presentation of a play, or the reproduction of a statue, call for skill and art on the part of the printer, artist, actor and sculptor, just as the machine-like precision with which a great engineering project moves forward calls for skill, experience and no small amount of courage on the part of the construction engineer.

The groundwork or general picture of the Kings River Development was long ago roughly sketched by Mr. A. G. Wishon, president of the San Joaquin Light and Power Corporation and his pioneering engineering parties. The direction of the streams and approximate head, or fall of water, were carefully mapped, contours of the country were studied, watersheds inspected, trails built and reconnoissance surveys made. Engineers were placed in the high country along various streams to measure the snowfall and streamflow. These hydrographic studies have brought out some interesting information on the amount of water available, and the records are not yet completed. All these data were raw material to be used by the designing engineers. It is from this mass of facts and figures, and from estimates, where definite information was not obtainable, that the size and location of reservoir sites, dams, tunnels and power houses are determined.

The "Snow Thief." Not the man—the instrument. Photographs illustrate weighing contents, inserting snow thief, and melting snow over a fire.

To measure the flow of a stream may appear a simple matter. But the measurement of streams that vary in depth from a few inches to twenty or thirty feet, streams that are solid ice in the winter and raging torrents in the spring, is a work that requires men of courage and daring,

ACCURATE WATER MEASUREMENT PAYS

FEATURES OF THE SPARLING METER

Accuracy

Guaranteed accurate within 2½%, plus or minus, above a minimum flow velocity of about one-half foot per second.

Durability

Monel Ball Bearings fully encased and adjustable to wear. Alemite lubrication. Good for years of service—all parts cheaply replaceable.

Ease of Installation

Burn or cut a hole to size of pipe, bolt on the saddle, caulk it snugly and slip the meter into place.

Simplicity

Direct reading; all parts accessible; operation easy to understand. Can be mounted at any angle.

Low First Cost

Simple in construction with few complicated parts reduces the manufacturing and makes possible low selling price.

men specially trained to make the observations. These men are known as hydrographers.

Preparations for a season's hydrographic work begin in August when supplies are packed in to the various cabins where the men make their winter headquarters. Five cabins were constructed and equipped with accommodations for the men. The headquarters cabin was at Cliff Bridge, 16 miles from Dinkey. Other cabins were at Buck Meadow, Sand Meadow, and Hobblers, while the most remote cabin was at Meadowbrook, 23 miles from Dinkey.

The supplies are locked in strong wooden boxes lined with sheet metal, and bear proof. Potatoes are buried below the frost line, while in the lower altitudes eggs are wrapped in mattresses. In the higher altitudes eggs, meat and vegetables are permitted to freeze about November 1 and remain frozen until April or May. Barbed wire is nailed across the windows to keep out the bears.

The men usually work in pairs starting their first regular round of inspection of the gauging stations before the first snow falls. Each recording station is visited, boxes are inspected and recording instruments are carefully gone over to see that they are ready to take accurate measurements.

Eight feet of snow, says this gauge.

A stream flow gauging station consists of a recorder well of stone or concrete, 3 by 4 feet, built on bed rock on the bank near the deepest portion of the stream. The water enters the gauging well by an intake pipe 4 inches in diameter extending to the deepest part of the stream. In the well is a Stevens automatic recording gauge showing the depth of the water. Eight of these stations are located on the streams under observation. Streams above 8,000 feet elevation freeze solid during the winter months. Snow measurements are made after each snowfall at points typical of the country at various elevations. For this work a "snow thief" or tube is inserted into the snow to the earth or rock and the contents of the tube weighed or measured to determine its density.

About April 15 the runoff starts. Under the warming spring sun small streams begin to trickle down the mountain sides. These streams usually freeze during the night but gather force each succeeding day until during May and June the canyons become raging torrents and the snow and ice forms dams making great lakes on the meadows. The impounding dams burst causing floods that wash away bridges and put gauging stations out of commission. These are the times when the hydrographer is put to the acid test. All this runoff must be measured, and if a gauging station goes out he must improvise one at once. This improvised station may benothing more than a notched sapling driven into the bed of the stream near a protecting rock. Because it is not an automatic station it requires his constant observation to get the varying levels of the stream, from which he can later make his computations. It is not unusual for an observer to swim a stream to reach certain gauging stations during the heavy runoff. Every station must be inspected daily during these periods.

While hydrographers were making stream-flow and runoff studies, engineering parties were making reconnoissance surveys.

The reconnoissance survey men are the "goats" of the engineering profession. When the average city man sits comfortably in an automobile on a smooth roadway cut from the granite side of a canyon and looks up to the brink of the cliff and down to the stream 2,000 feet below he begins to have some idea of the daring and ability of the engineers who surveyed the route for this road. And when Mr. Cityman is told that the engineer who made these surveys found the country with nothing more passable than a deer trail,

he looks with respect at the wiry young chaps he sees packing a transit, rod and axe and nonchalantly making their way up a trail to "run a line," possibly over a mountain to indicate the course of a tunnel. Mountain goats turn green with envy at some of the feats these boys perform,—all in a day's work. They are the "S. I.'s," the civil engineers, who get the facts and figures upon which the designing engineer works out his problems.

Kings River Project Approved by Power Commission

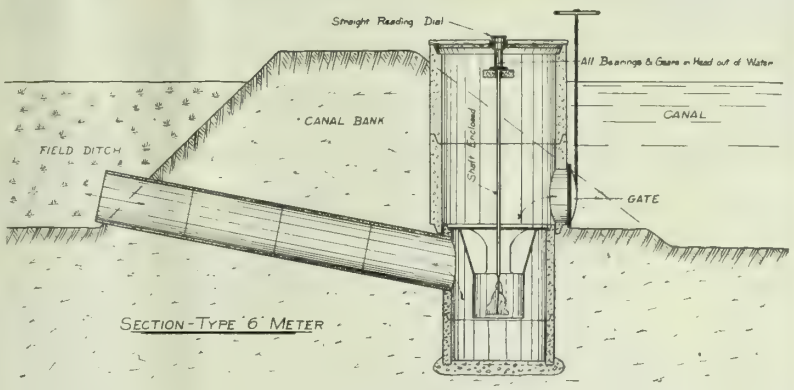
Development of North Fork Embraced in Amended License of San Joaquin Light & Power Co.

The Federal Power Commission, by action taken in January, has authorized amendment of the license issued to the San Joaquin Light & Power Corporation on July 28, 1922 for the project designated as No. 175 so as to include its developments on the Upper North Fork of Kings River, in California. The new works will consist of four dams known respectively as the Helms dam, the Upper North Fork diversion dam, the Fleming Creek diversion dam, and the Post Corral dam, two water conduits having a total length of about 10 miles, and a power house known as the Helms power house located near the upper end of Lake Wishon. The Helms dam will be a constant-angle-arch, concrete structure about 297 feet high, creating a reservoir of approximately 102,000 acre feet. The Upper North Fork diversion dam will be a rock-fill dam, with a total length of about 1,375 feet and a crest width of 12 feet. The Fleming Creek diversion dam will be a rock-fill dam 80 feet long and 15 feet high. The Post Corral dam will be a rock-fill structure, having a maximum height of about 66 feet and crest length of 985 feet. The power house installation will consist of three 13,600 Kva. generating sets, direct-connected to overhung-impulse turbines.

Lake Will Be Formed

An artificial lake, four miles long and a mile wide, will be formed if plans of the Montague Irrigation District in the Shasta Valley of Northern California are carried out. The lake will be stocked with game fish and surrounded by duck preserves and country homes, it is contemplated. Work has been begun, and the project is expected to be completed in 1927.

The RELIANCE METER

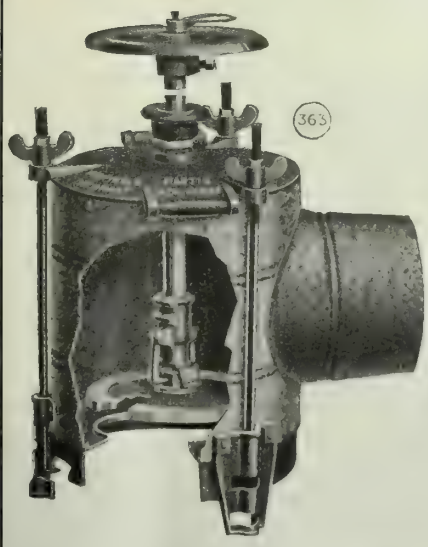


THE "Type 6" Reliance Irrigation Meter offers you standardized permanent construction at a very low first cost. Their sustained efficiency with a minimum of upkeep has been proven by 12 years usage. Cut shows installation of the 4 sec. ft. size in 24 and 30-inch concrete pipe. This is the standard type of setting adopted by many irrigation districts in Texas and elsewhere who are now equipping all their deliveries with this device. The "Type 6" meter is furnished in sizes ranging from ½ up to 16 sec. ft.

For further information and prices write—

RANDALL CONTROL & HYDROMETRIC CORP.
1014 E. Ninth St., Los Angeles, Calif.

The MARTIN
PORTABLE HYDRANT



Martin engineers, specialists in utility irrigation appliances, never designed a more serviceable piece of equipment than the MARTIN PORTABLE HYDRANT. Its use with MARTIN Alfalfa Valves Type B and Type Q enables the irrigator to control the direction of flow easily. Four checks can be irrigated handily and the operator knows exactly the amount of water each check is getting.

The spout of the hydrant can be turned in any direction. Two hydrants are generally used on one pipe line. While one is set and operating, the other can be moved to the next valve and set up ready to operate. Surface pipe can be attached to hydrant before valve is opened. The valve is opened and closed by the wrench built into the hydrant. After the entire field is irrigated, the hydrants can be removed and placed in the tool house. As the Type B valve is flat on top, there are no obstructions in the field to catch the mower or rake.

We manufacture the original line of Irrigation Appliances Outlet Valves, and Cut-off Gates for the definite division of water over the field from Concrete Pipe Lines

WITH THE WATER COMPANIES

Of Interest Expressly to Water Works Engineers, Superintendents and General Managers

HAVE YOU TRIED CEMENT LINING FOR CAST-IRON PIPE?

By A. P. LOVELL

Superintendent of Water, San Diego, Calif.

SINCE the first use of mountain water by the City of San Diego, (this water being what is termed an "active water" by water men) the city has been seriously bothered by tuberculation of its C. I. mains. This applies particularly to mains of low velocity, the higher velocity mains having apparently kept themselves clear.

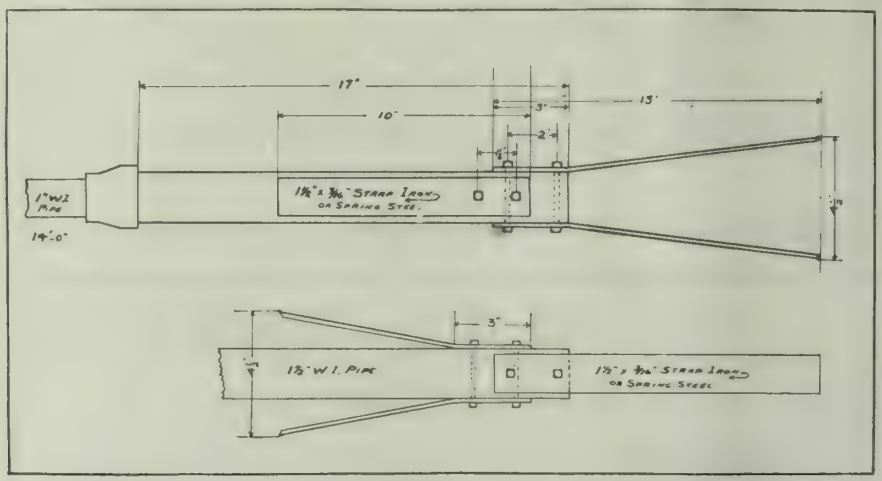

FIGURE 1.—The first step in Mr. Lovell's interesting experiments was the construction of a pipe-cleaner, as shown in this sketch.

Experiments have been made to prevent this tuberculation, from time to time, in a more or less desultory manner, with various pipe dips, but without avail.

Some months ago it was necessary to remove a 4-inch C. I. main and replace it, as the district served by this main was getting an inadequate amount of water. As it is now our policy to lay no mains smaller than six-inch in thickly settled districts, it was accordingly replaced with one of that size. The four-inch main had been in use about twenty-five years and externally was apparently in as good shape as the day it was laid. Investigation of the interior, however, proved it to be so badly tuberculated that it probably would not have delivered as much water as a new 1½-inch pipe. Had this main remained free of tubercles it would not have been necessary to replace it.

I had been watching with interest for several years past the experience of Charleston, S. C., with cement-lined pipe in combatting similar conditions, and decided to experiment with cement-lined pipe in San Diego.

Owing to the lack of funds for experimental purposes it was necessary to carry on our experiments with what tools and material were available in our own yards.

I derived a great deal of information from correspondence with the Pacific Coast representatives of the various cast iron pipe foundries, which now line their pipe with cement when so ordered; and from reading articles written by J. E. Gibson, manager and chief engineer of the Charleston (S. C.) Water Department.

WE FOUND that cement-lined pipe, wrought iron, had been in use in the New England states for some sixty or seventy years. The condition of the interior of this pipe, whose known age was at least thirty-nine years, was as good as or better than when laid while externally it was badly pitted. The pipe in question was from Danvers, Mass., and the same condition existed in a W. I. pipe twenty years old from the Norfolk, Va., water system.

As Mr. Gibson had made very exhaustive tests with calibrated instruments to determine the value of the coefficient "C" in the flow formula of Hazen and Williams, I will quote the result of a few of his tests as published by a large manufacturer of cast-iron pipe:

Date of Test—December, 1922			
Flow in 1000 Gals. per 24 hours	Vel. in Ft. per sec.	Loss of Head per 1000 Ft.	Value of "C" H and W
299.44	2.68	4.97	138
496.34	4.45	12.55	139

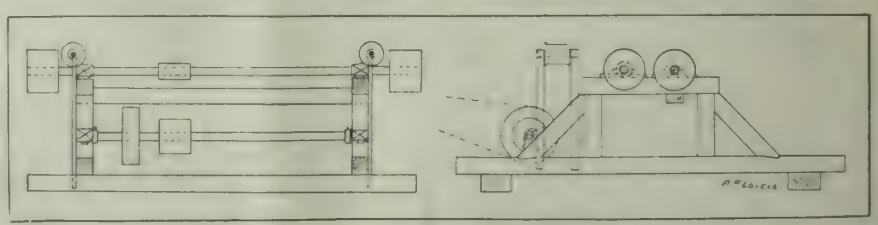

FIGURE 2.—An ingenious machine was designed "from odds and ends in our own yard" to rotate the pipe during the lining process.

OPERATING THE HOME-MADE ROTATOR

Mr. Lovell found that this machine worked best with a one-inch pipe running free inside the pipe which was being lined, spreading the cement evenly with a trowel-like action.

Date of Test—August, 1924

Flow in 1000 Gals. per 24 hours	Vel. in Ft. per sec.	Loss of Head per 1000 Ft.	Value of "C" H and W
299.5	2.46	3.79	142.5
498	4.09	9.23	146.2

As the cement lining should remain smooth with age, it was reasonable to assume that the value of the coefficient "C" in the Hazen and Williams flow formula would not be impaired after years of use.

Cement lining, when properly installed, presents a smooth surface, and, while the internal diameter of the pipe is slightly restricted by its use, Mr. Gibson's experiments showed a higher carrying capacity for cement-lined pipe than that of ordinary sand-cast pipe, owing to its lower friction head.

With the above information at hand, I decided to try an experiment, which, if successful, would be of interest to all water department officials—that of cleaning the 4-inch pipe mentioned in the foregoing and lining it with cement.

A pipe cleaner was made as shown in the accompanying sketch (Figure 1) with which we removed all soft rust and tubercles. No attempt was made to get the metal absolutely clean as we wished to know whether we could hold the cement in this old rusty pipe.

I had information to the effect that originally the cement was distributed in the pipe by a large iron bullet. The pipe was set on end and a bullet-shaped casting was lowered into it. The cement was then poured in and as the bullet was withdrawn it distributed the cement on the walls of the pipe.

The present method in use at the foundries is to distribute the cement by centrifugal motion. We accordingly designed a machine to work along these lines. This machine was made of odds and ends found in our own yard, as shown in the illustration (Figure 2). It was driven with a Fairbanks-Morse, 2½ H. P. type "Z" gasoline engine.

As we had been unable to get any information as to the proper speed of rotation or the mix, it was necessary for us to work this out by ourselves. Experiments were made with a number of different mixes and speeds.

Both Portland and natural cements were tried, but the best results seemed to be with the natural cement. Our final mix was seven parts natural cement to one of very fine sand, mixed with just enough water to allow to pour from a bucket, or about the consistency of cold molasses.

A trough for feeding the cement was made by cutting a length of 2½-inch W. I. pipe longitudinally with an acetylene torch.

We first tried to feed the cement with the pipe rotating, similar to the method used to pour the iron in the De La Vaud process. As this was not successful, we then filled the trough and ran it through the pipe, before starting it to rotate, dumping the whole batch at once. This worked fairly well, but gave some trouble in distributing the cement evenly.

Our present method, which has worked out very well, is to dump the mix from the trough full length of the pipe before starting rotation, then run a length of 1-inch W. I. pipe through and start the machine. The 1-inch pipe running free inside the larger pipe acts as a trowel in distributing the cement. The machine is allowed to run one or two minutes or until on inspection the ce-

ment is found to be evenly distributed, when the 1-inch pipe is removed and large pipe is allowed to spin for about ten minutes.

The proper length of time to allow the pipe to rotate must be found by experiment, as the time varies with the amount of water in the mix. The jarring of the pipe on the rolls is very beneficial up to a certain point, as it seems to throw the cement to the walls of the pipe and extract the surplus water, but, if allowed to run too long, the jarring of the pipe will cause the cement to fall away after the initial set takes place.

After experimenting with various speeds to as high as 400 R. P. M. we found the speed of 260 R. P. M. to give the best results.

SECTIONS of this pipe, which have been removed for inspection after one year's service, show the cement lining to be intact and without signs of incrustation.

Since the above experiment we have successfully lined several thousand feet of 6-inch C. I. pipe. While satisfied that cement lining is the proper procedure for this locality, it has been necessary to discontinue the work at present, owing to the lack of space and necessary funds to do the work economically.

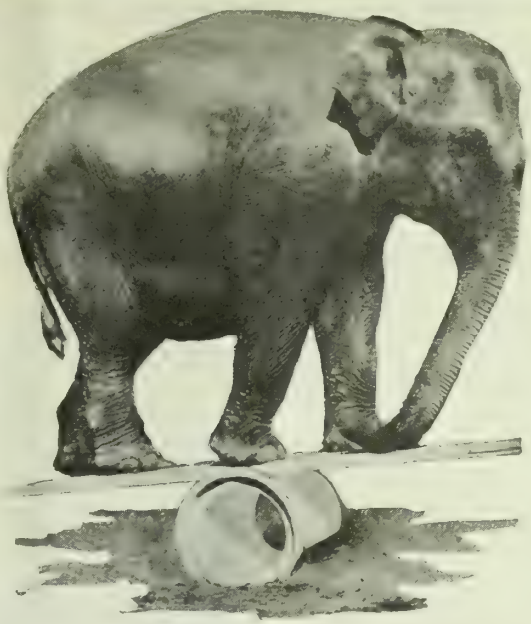
The lining averages from one thirty-second of an inch to one-sixteenth of an inch in thickness. Working as we were in restricted space and with crude apparatus, we lined 6-inch pipe for 2.3 cents per foot. This included all labor, material and power.

For cutting cement lined pipe we advise the use of some type of rotary pipe cutter, as the jar of cutting by the ordinary method with cold-cut or diamond point may damage the cement a short distance back from the cut.

It is interesting to note, however, that, according to an article by H. Y. Carson, research engineer for the American Cast Iron Pipe Company, in the case of the old cement lined W. I. pipe removed in New England, it was found that even though small spots on the pipe were not covered with the cement, these spots showed practically no signs of rusting. The theory advanced is that a film of neutralized water formed on these exposed spots and prevented the damaging elements in the water from reaching the metal.

New Reservoir for Pendleton

The city water commission of Pendleton, Oregon, has decided to build, at a location to be selected on the "north hill" of the city, a $35,000 reservoir to increase the reserve water supply and afford better pressure.



You *Name the* Load
We *Make the* Pipe!

SINCE concrete pipe (as made by Bent) came into its own, engineers question no longer its striking advantages for a great variety of uses. *But*—a concrete pipe installation is either a mediocre or an eminently superior job of work, depending upon who fulfilled the contract.

Many trade names have become hall-marks of tradition, that serve as an unerring guide to discriminating buyers. Today the name "BENT" on a joint of Concrete Pipe marks it as a strictly finely made product. The same care and skill is exercised in its manufacture, and in the laying of the line, as though every future contract depended on *that* job meeting the fullest requirements of specifications—*and more.*

Let us give you a "concrete" demonstration of what we mean by "Bent" Service.

WHO'S *WHO* AND WHO'S *WHERE*

IN THE WORLD OF HYDRAULICS

Personal Notes and Impersonal Observations About Men You Know

Stephen L. Owens has been appointed county agent in Yuma County, Arizona, to succeed R. B. Coglon, who has resigned to take up extension work in Missouri.

William Durbrow, secretary manager of the Glenn-Colusa Irrigation District, and president of the Irrigation Districts Association of California, recently addressed a meeting of land-owners at Arbuckle, California, discussing the proposed annexation of the Arbuckle section to the Glenn-Colusa district.

J. B. Lippincott, Los Angeles engineer, has been named by the city council of San Diego to examine and pass on the plans and specifications of the El Capitan pipe line shortly to be constructed by the city. The proposed line will probably be completed in less than a year.

Jose Nunez Pasquete, chief engineer of highways for the Spanish Government, was a visitor in February on the Salt River Valley irrigation project in Arizona. He is representing the government of Spain in studies of American irrigation systems which he is making preliminary to assuming charge of large reclamation activities in his own country, involving about 600,000 acres.

Elwood Mead, Commissioner of Reclamation, has been named by Hubert Work, Secretary of the Interior, to represent the department on an interstate board formed for the purpose of determining an equitable allocation of the waters of the Columbia River between the states of Oregon, Washington, Idaho and Montana.

The appointment of A. J. Lintner, of Victorville, California, as a member of the directorate of the Mojave River Irrigation District, has been confirmed by action of the Board of Supervisors of San Bernardino County. Mr. Lintner is said to represent a faction in the district which favors the sale of $2,500,000 worth of bonds voted by the district to finance a 25,000-acre irrigation project, and it is asserted that the confirmation of his appointment will result in the sale of these bonds.

Hervey Lindley, president of the Columbia Basin Irrigation League, James M. Kyle, former president of the Oregon Irrigation Congress, Charles Hebbard and Frank T. McCollough, of Spokane, and Charles Bratenover, of Minneapolis, are in Washington, D. C., in the interest of the plan of the Columbia Basin project. Their intention, it is announced, is to ask Congress for a small appropriation for preliminary work on the project.

Reorganization of the city Board of Water Commissioners of Denver, Colorado, during January resulted in the election of Ernest Stenger as president, S. M. Perry as first vice-president, and Frederick W. McCartney as second vice-president. Their election followed the resignation of Frank L. Woodward as president and B. A. Sweet as second vice-president. W. C. Danks, formerly first vice-president, resigned from the board some time ago.

W. B. Tucker, agricultural agent in Cook County, Oregon, and W. T. McDonald, Cook County agent, in co-operation with state irrigation leaders including W. L. Powers, professor of soils at Oregon Agricultural College, are planning an irrigation school to be established in Central Oregon for the benefit of farmers this summer. It is contemplated that the managers of the large irrigation projects in Oregon will assist the school, and that some centrally located city will be selected for its location.

Javier Sanchez Mejorada, well known Mexican irrigation engineer, has been named as one of three men comprising a board of irrigation commissioners, created by the federal government of Mexico. Sr. Mejorada has been the representative of the Mexican government in many of its dealings with American irrigation interests, and has lately been chief of the Mexicali irrigation zone. He is expected to exert an important influence on future irrigation developments in Mexico.

Geo. H. Trask, assistant general manager of the Randall Control & Hydrometric Corporation, manufacturers of the Reliance Irrigation Meter, has recently returned from an extended business trip through Arizona, New Mexico and Texas. He reports considerable activity in irrigation development, along with a growing demand for modern machinery and appliances for more efficiently controlling and delivering water to the consumer. Texas is rapidly forging to the front in irrigation development, aided and fostered by constructive laws and able engineering, says Mr. Trask. One thing that especially took his attention was the fine reception that MODERN IRRIGATION is receiving from the irrigation industry as a medium for the exchange of ideas, he declared, on his return.

Stuart B. Show has been appointed to the position of district forester of the California district, United States Forest Service, on recommendation of Forester W. B. Greeley, approved by Secretary Jardine.

Mr. Show is a graduate of Stanford University and received his technical education in forestry at the Yale Forest School. He will succeed Paul G. Redington, who has been chief of the California district for the past six years and will soon leave for his new assignment as Assistant Forester in Washington.

The new district forester is ably fitted by education and wide experience to handle the many and complex forestry problems of the state. Born in Nebraska, he came to California in his early youth, his father being the late Professor A. B. Show, for many years with the history department at Stanford University. Mr. Show has been an officer of the United States forest service in California for more than sixteen years. He started as a student forester on the Shasta national forest and has steadily advanced to the position of assistant district forester in forest research, which work has taken him into practically every forest region of California.

Water Power Output Larger

Production of electrical energy from water power in the United States increased 11.3 per cent in 1925, according to a report issued by the U. S. Geological Survey. Production of power from water on the Pacific Coast increased, during the same period, 43.9 per cent, while electrical energy produced from fuel (on the Pacific Coast, mostly oil and gas) decreased more than 50 per cent.

Big Orland Project Approved

A permit issued by the California Division of Water Rights contemplates the irrigation of 21,000 additional acres by the U. S. Reclamation Service on the Orland project, the most successful of the federal projects. An expenditure of $1,200,000 is contemplated in the diversion of 50,200 acre-feet of water annually from Stony Creek.

Deed Involves Large Sum

The second largest deed ever filed in the County of Riverside, California, was the one recording the sale of the property and holdings of the Palo Verde Mutual Water Company to the Palo Verde Irrigation District, for the sum of $1,274,500. The deed was filed early in January, and completes the amalgamation of the Palo Verde levee district, Palo Verde irrigation district and Palo Verde drainage district into a single organization.

Swendsen Tells Water Needs

George E. Swendsen, chief engineer of the Fresno Irrigation District, was the main speaker at a recent meeting of the Fresno (Calif.) Rotary Club, speaking on the water situation of the San Joaquin Valley in particular and the state in general. "The Valley made an overdraft of approximately 500,000 acre-feet on its ground-water supplies in 1924," Mr. Swendsen told the club, "and in 1925 gained back about a third of what had been lost."

Growth for Pump Concern

Additional proof of the importance of irrigation to the industrial as well as the agricultural prosperity of the southwest is afforded in a recent announcement of the Pacific Pump Works. This company has doubled its office space by a considerable addition to its building at 350 Bicket Street, Los Angeles, and has begun work on a large new structure for accommodating its stocks of pipe and machinery.

STRENGTH

Strength in every line and part—strength to meet long years of hard usage—strength to endure abuse. This is the strength you find in PEERLESS PUMPS. And that is the reason they give complete satisfaction where irrigation problems are most difficult and exacting.

PEERLESS PUMPS are made for wells 7" or larger—capacity 180-3000 gallons per minute. Write for our new catalog and let us help you with your irrigation problems.

Peerless Pump Company

1916 E. Sixty-Seventh St. DElaware 0986 Los Angeles, California

DIGGING—CLEANING CANALS
AT LOW COST

THE NEW RUTH WITH ITS CONTINUOUS FLOW OF DIRT will dig or clean canals and trenches at a minimum cost per cubic yard or lineal foot heretofore considered impossible. The Ruth cuts continuous, even banks and smooth bottoms. Working successfully in marshy or dry ground, or canals full of water. The Ruth positively cleans the canal of all muck, sand, small willows, tules and water grasses.

Send for Bulletin No. 8—it illustrates the New Ruth Dredger; type and size of canals it will dig or clean; gives specifications, operating costs and maximum capacities.

RECLAMATION

HOW CAN WE SOLVE THE LAND SETTLEMENT PROBLEM?

By GEORGE H. KREUTZER*
Director of Reclamation Economics

SETTLEMENT of unoccupied or new lands in the West has been at a standstill since the war. In addition to the many settlers required to fill up the Federal irrigation projects, large numbers are needed on the irrigation enterprises developed by the use of private capital.

Some of the reasons for this inactivity during the past five years were that farming has not been a popular occupation because of the relatively low prices of agricultural products; that land prices were inflated; that taxes and other fixed operation charges were high; that the cost of developing and equipping irrigated farms had greatly increased; that credit for new undertakings was hard to get and when secured was subject to repayment terms that the farmer's income could not meet; that the capital of prospective settlers shrunk with their unprofitable investments in other occupations, all of which made it safer for them to get a job with good wages than to take land; and, finally, the lack of a cordinated and comprehensive plan of land settlement to meet the changed conditions.

During the period of high prices for agricultural products irrigated land changed hands at inflated values and mortgages increased because of these purchases. Settlers could not pay these debts when their earning power decreased, and many mortgage foreclosures resulted. The number of farms owned by banks and mortgage companies increased proportionately. No new settlers were found to take the places of those who had left.

ONE of the large Federal irrigation projects has only 31 per cent of its land occupied by resident owners. The remaining lands are either abandoned or owned by nonresidents or former mortgagees. These farms are tilled in a haphazard way by the neighbors for a share of the crops. Some of the results of this are low yields, dilapidated improvements, and hundreds of acres of weeds. Taxes and irrigation charges are not paid.

One area of this project, comprising 101 farms with an aggregate area of approximately 9,000 acres, is occupied by 15 resident owners, and the remaining 86 farms are either abandoned or owned by nonresidents. Most of those that are not already foreclosed are heavily mortgaged. The average delinquent state, county, and irrigation taxes amount to $15.83 an acre. The delinquent taxes will soon amount to more than the land is worth. Tax certificates are offered at public sale by the county authorities, but there are no buyers. County institutions are being operated largely by warrants, and the irrigation system is being operated at public expense.

The area of this project is 75,000 acres, and the United States has expended for the construction of the irrigation system approximately $3,500,000, or an average of about $45 an acre. Water was first made available in 1908, and to June 30, 1925, $481,144 has been repaid, or less than 15 per cent of its cost in 17 years. The United States has spent $1,109,625 for the operation and maintenance of the irrigation system on the theory that on December 31 of each year the sums expended would be repaid by the land owners, yet less than one-half of this sum has been paid.

IF THESE lands were poor, this situation could be more easily understood. The lands are fertile, and the climate is suitable for the successful production of alfalfa, sugar beets, potatoes, small grains, corn, and common vegetables. The water supply is unfailing, the water right cheap, and the operation and maintenance of the irrigation systems one of the cheapest of either Federal or privately operated irrigation projects. Good railroad transportation is provided, and the large eastern markets are much nearer this project than most of the remaining irrigated lands of the West. With these favoring conditions, land should sell readily and the project should be a complete financial and economic success.

One of the difficulties is that the project is located on the border line between the arid region and the section of ample rainfall; hence crops can in some seasons be profitably grown without irrigation. In other years crop yields are so low as to be entirely unprofitable, yet when good cultural methods are practiced with irrigation the yields are uniformly good year after year. One farmer follows dry-farming methods and another irrigation farming, and this does not make the highest use of the water nor does it build a profitable agriculture for the project.

The irrigation district has recognized the need of settlers and has spent considerable sums of money advertising but has not sold one farm as a result of it. Advertising alone has been a failure. Something more is needed.

THIS community chiefly lacks a group demonstration of skilled irrigation farmers, each owning and tilling his land, in which proper crop rotations are followed, good livestock kept on farms and the creation and functioning of cooperative institutions for marketing and credit made possible by a number following similar methods and working together. With this would come substantial improvements and neatness in cultivation that is properly regarded by land seekers as the reflection of community prosperity and a desirable place to live. The same character of land in the vicinity showed yields of as much as 20 tons of sugar beets an acre, 45 bushels of corn, and other crops in proportion. Such yields from one farm do not impress a land seeker nor does it build a profitable agriculture for the district.

There should be 50 or 100 farmers close together, all producing such crops,

*This paper was delivered by the author before the recent settlement conference at Washington, D. C., called by Dr. Elwood Mead, Commissioner of Reclamation.

The most mobile dragline on the market

AND if any machine should be mobile certainly that machine is a dragline.

You never have to fight a Northwest to get it into place. Maneuvering is quick and without strain; it goes into places that would stop other machines. All operations are controlled by one man from the cab and with the cab in any position. Turning in either direction is accomplished with one lever and without backing up and there are no air pipes to freeze.

—Ask about the Northwest patented crawler base, an exclusive Northwest feature.

keeping good livestock, and confining their activities to their own farms with consequent rewards. Instead of this, frequently settlers farm from one to six additional farms with their own efforts, tilling them poorly, from which they receive low returns or even losses. One settler was farming his own 80-acre farm and had six additional farms rented for sums of from $75 to $200 a farm and could not possibly put them all in crops or take care of the crops when planted.

The best way to speed up settlement and bring about more profitable agriculture in the more or less abandoned area is for the Government to acquire these lands for the delinquent taxes to save its initial investment in the irrigation system. If such a step is taken, some of the nonresidents will pay their State, county, and irrigation taxes and thus turn in to the United States Treasury considerable sums of money. Lands that are not redeemed will be acquired at not more than $20 an acre. These abandoned lands, while cheap, are in no condition to be offered to settlers. Funds should be provided to repair and repaint the building improvements, fix up the fences, and plant from 15 to 25 acres of alfalfa on each. These crops would make it possible for settlers to make an income the first year, as well as provide neat-looking properties in place of the devastated and run-down properties now existing. The cost of doing this work per farm will be relatively small and should be added to the purchase price of the land. The terms of purchase should be 15 per cent or 20 percent as a cash payment and the balance repaid in 20 years with interest at 4 or 5 per cent. Some long-time and intermediate credit should be added to this, so that settlers of small or moderate incomes can complete the development of their farms soon after they purchase them.

If this were done, the farms would be attractive, the prices moderately low, and purchase terms fixed so that the farm can be paid out of the farmer's income. It will change the appearance of these farms and the community and will appeal to purchasers as a real opportunity.

On another project of 48,000 acres only 14,000 acres were irrigated in 1924. Water has been available since 1909, but farmers have been slow to use it. Something must be done to increase the use of water for irrigation and make the revenue of the project sufficient to pay the cost of operating it. The lands of this project are fertile. The average crop value for 1924 was $39 an acre, which is as high as some of the thickly settled prosperous projects.

Fifty farms which were not tilled by their owners, and some of which were not farmed at all, were investigated, and it was found that the average delinquent general and irrigation taxes amounted to $10.24 an acre, exclusive of penalties. The delinquent irrigation charges varied from a few dollars to as much as $1,335 for a 160-acre farm. Such conditions, if allowed to continue, will make the project insolvent, while if a plan to acquire these lands is put into effect and arrangements made to make the farm attractive for settlers the use of water will increase and the cost of it ultimately be returned to the Government.

WE MUST remember that economic conditions have so improved in industrial centers during the past score of years that the old pioneer type, willing to go on the land, live in a tar-paper shack, subject his family to privations for years to make a farm out of the wilderness has practically disappeared. The same man to-day can, and does, stay in the city where he and his family have the comforts of city life and a steady income. We must meet this changing condition by providing that raw or unimproved lands shall be developed to the point where the new settler can make an income the first year. This calls for some development before the land is sold, long terms for the purchase of land, long-time and intermediate credit to complete the development of the farms and equip them with good livestock, assistance in the organization of needed cooperative institutions, and guidance and advice to settlers who purchase farms.

It is believed that with such a plan put into operation the full cooperation of all other agencies can be secured and settlers in good numbers obtained.

Williston Project Sold

Sale of the Williston Reclamation project situated near Williston, South Dakota, for the sum of $50,000 was authorized at the Interior Department in January.

The purchaser, W. R. Davidson of Williston, made the best offer to the Bureau of Reclamation after a bidder at a previous sale had refused to execute his contract and forfeited $7,700 to the Reclamation fund.

Terms of the new sale, which were the best obtainable, provide in addition to the purchase of the property that a rental of 10 cents be paid for each ton mined at the project coal mine owned by the Government.

For Detailed Listings, Branch Offices, Etc., See the Buyers' Guide to Leading Supply Sources—Pages 55-56

Cuyamaca Deal Completed

Final details of the purchase of the Cuyamaca Water Company by the La Mesa Irrigation District (Calif.) were completed in January by the payment to the Company of $1,200,000, constituting the first payment of a total consideration of $2,000,000. The property transferred includes Cuyamaca Dam, about 1100 acres in Cuyamaca Lake, Fletcher dam site, flume line, El Monte pumping plants, El Capitan Reservoir, Grossmont Reservoir, Eucalyptus Lake, Murray Dam and lands flooded, as well as all the distribution lines outside the city limits of San Diego, and all the water filings under the law of the State of California which the Cuyamaca Water Company own excepting Mission Gorge dam site No. 3 water filings. The district has an option for five years to purchase Mission Gorge dam site No. 3 from the Cuyamaca Water Company at a price of $150,000.

The Cuyamaca Water Company still retains the distribution lines in Normal Heights, Kensington Park and East San Diego, which they control together with a contract for the purchase of water from the La Mesa district.

Fire and Water

(*Continued from Page 12*)

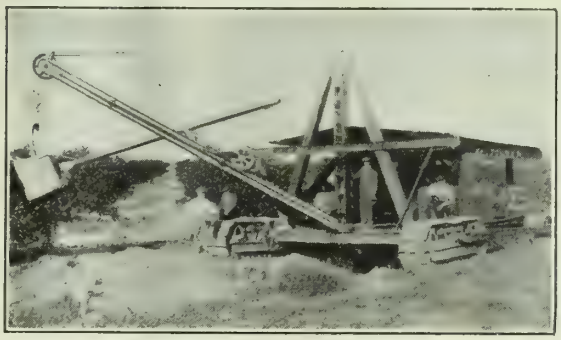
when nearly 100,000 acres of brush cover were burned over. As most of this material is deposited where it is not wanted, it constitutes an economic waste, first from the standpoint of the decreased soil fertility of the denuded slopes, and second because of the cost of removal of the material when it is deposited in harbors, rivers, etc.

EACH brush fire, then, is a cause of considerable loss, a loss which takes its toll from each user of water from a given burned area, a toll to be paid in the increased cost of water, whether obtained from ditch, reservoir, or artesian basin; a toll to be paid in increased taxes to control and confine floods to their channel, rebuild roads, bridges, and other improvements damaged by the floods, and to dredge out channels and harbors; a toll to be paid in the decreased returns to the individual and community through decreased yields because of water shortage; a toll to be paid in the loss of fishing and hunting and the recreational value of the mountains as a playground. With such economic losses following fires in the watersheds of California, it is inevitable that each citizen should recognize that fire can extinguish water, and should learn to look upon fire as the red enemy of agriculture as well as of industry.

For Cleanout -- Maintenance -- New Ditches

There's a Bay City for Every Job

BAY CITY Land Dredges span the ditch, can dig any desired slope, and dump waste on both banks. BAY CITIES leave clean, wide berms, and can work up or down streams. One trip over the ditch is enough. The Shovel Type Dipper handles hard material in which other types of buckets cannot make a good showing.



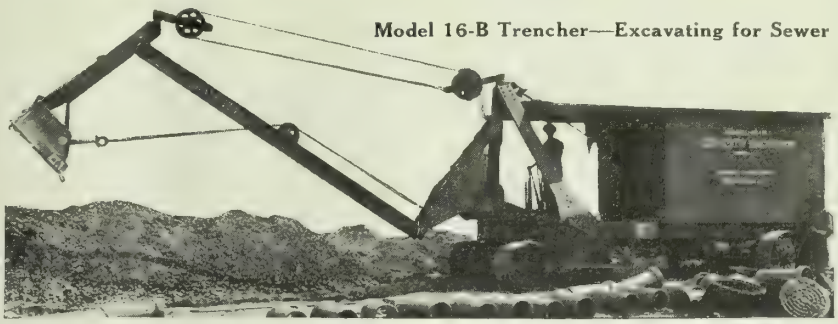
At left—One yard BAY CITY Dredge digging and cleaning ditches in Florida Citrus Groves.

BAY CITY Land Dipper Dredges are built to fit the job. Walking, Crawler, Track or Floating mounting. Easily dismantled, transported and assembled. Capacities ½ to 1½ cubic yards. Oil engine or electric operation.

FOR SMALLER DITCHES — OR PIPE LINE TRENCHES

The BAY CITY 16-B convertible Excavator will handle a wide range of work. Operates Dragline, Trench Shovel, Clamshell or Skimmer. All steel. Shipped assembled. Digs any width or depth up to 20 feet.

Model 16-B Trencher—Excavating for Sewer



or—Model 4 Excavator

BAY CITY Model 4 is a small low-priced convertible, one-man operated Excavator. Fills the gap between hand labor and high priced equipment. Capacity 20 to 40 cubic yards per hour. Gasoline or electric power. A Real Digger economically designed for the small job. Also operates shovel, and clamshell.

IRRIGATION FINANCE

FINANCING IRRIGATION PROJECTS THROUGH BOND ISSUES

By W. R. WILLIAMS
Vice President, Bank of Italy

ALL THE undertakings of man require funds with which to meet the cost of whatever structure is erected and irrigation projects are necessarily governed by this same requirement. Because of this necessity, whenever a new enterprise is being launched, the first problem always is how to obtain the required funds at the lowest cost and under the most favorable conditions. This problem is not always easy of solution and many projects have gone down in failure simply because insufficient care has been exercised and improper methods used.

Some kinds of business have relatively little difficulty in raising funds for their undertakings. Particularly is this true of railroads and public utilities in general. One of the principal reasons for the greater facility with which these activities are financed is that the conduct of their business is under close governmental observation and guidance; another reason is that their methods of financing are generally known and understood; a third reason is that investors usually have a considerable degree of confidence in the ability of their business management. These elements, combined with others of importance, create confidence in the enterprises and this confidence results in a willingness on the part of the investing public to purchase these securities.

The most favored of all kinds of constructive enterprises, in reference to their financing, are what we commonly refer to as public improvements. While some public improvements are paid for direct through taxation, by far the greater volume is financed through the sale of bonds. Governmental bonds, in this country at least, find a ready market, but even in this general group there are preferences. A bond of the United States Government sells more readily and with a lower rate of interest than do bonds of the states; bonds of some states have preference over bonds of other states, and so on down through the list of governmental subdivisions. The more favorably a government is known, and the more certainly its financial stability is established, the better is the market for its bonds. This rule applies universally throughout the whole financial structure.

THE PRIMARY strength of governmental bonds is the taxing power, but even governments, whether national, state or otherwise, must be backed and supported by fundamental principles or even their bonds soon lose their reputation and character. The first pre-requisite for the creation of a ready market for any kind of security is that the security must be entitled to a first class character and reputation. For any kind of a security to be entitled to such first class character and reputation, the security must actually possess the elements of strength that it is represented to have.

This principle of the necessity of underlying strength is the one great outstanding fact that must always be kept in mind in seeking to finance irrigation district projects. Unless this essential principle be strictly adhered to, irrigation districts and their bonds are bound to suffer.

Most investors will not go to the trouble of making any personal investigation of the stability and strength of any particular proposed investment, and but very few are capable of passing in critical judgment upon the bonds of irrigation projects, even though all of the factors affecting the bonds are available to them. Purchasers rely either upon the general reputation of irrigation district bonds, or upon the reputation of the particular district, or upon that of those who deal in such commodities and who present the bonds for sale.

There is no good reason why irrigation projects should not have a reputation equal at least to that enjoyed by public utilities. Irrigation is certainly as important as any public utility, and irrigation districts may be as well founded as a public utility project, and good business management should not be beyond the reach of irrigation districts. An irrigation district is like any other project that must depend upon the successful completion of its structure to produce income sufficient for the payments demanded by the bonds issued to finance the project. *The undertaking must be completed, once it is started and its bonds sold.* The first thing to be determined, therefore, is that the conception of the project is sound. In reference to an irrigation project, the soundness of the conception is governed by many factors, chief among which are the quality of the soil, the sufficiency of the water, and ability to bring the two together within a limit of reasonable cost.

The quality of the soil should be determined at the very beginning. Unless the soil is productive, nothing would be gained by putting water upon the land. The sufficiency of the water must also be determined beyond question, for, regardless of the value of the soil, there could be no justification for saddling the cost of an irrigation system upon the land unless it is certain that sufficient water will be obtained. And, again, even though the soil is good and there be an unquestioned supply of water, no irrigation project should be undertaken without first knowing to a reasonable exactness what it is going to cost to place the water upon the land. Excessive cost would destroy the very purpose of its creation. It could not be profitably used. Nothing should be left undone to determine that these three underlying factors are to a certainty favorable.

A great amount of irrigation is, of course, developed and carried on by private enterprise. An individual may own land and develop the water therefor; likewise, a corporation may provide the necessary water for its own lands. Each such project must stand on its own merits and must be financed in the manner most available to the projector. It is well recognized however, that the most successful means for the general promotion of irrigation projects is through the medium of irrigation dis-

tricts. It is because of this fact, that it is so important that a high standard of reputation be established and maintained for irrigation districts. An individual land and irigation project may fail, and irrigation as a whole not suffer in the least as a consequence thereof; but the failure of one irrigation district serves to weaken and materially undermine the reputation of all irrigation districts.

THE SUPREME difficulty of irrigation district projects lies in the fact that they are confronted with the most serious responsibilities and problems right at the inception of the project. If an irrigation district is organized where the land is already occupied by people who are seeking to better their condition, the financial strength of such people is usually very weak; and, if the irrigation district is being put forth incidental to a land promotion, the promoter is usually more concerned with how he may sell the land than he is in the creation of a sound financial project. By sound financial project, in this reference, I mean not only the elements that go into the bonds themselves but equally those elements that go to create a successful and profitable business enterprise.

The credit of an irrigation district is at its lowest ebb at the time the project is conceived and launched. The management is not experienced; and, unless they receive effective guidance, the directors scarcely know which way to turn. The project must be well conceived and properly guided from its very inception, or else innumerable troubles arise, from the burden of which it may be well nigh impossible to obtain relief. A district goes through the process of organization but once. It must, therefore, be guided by the experience of others. It would be manifestly impossible of success if each newly organized district in turn relied solely upon its own plans and methods, conceived and put into operation by its own directors alone and unaided.

THE QUESTION then is how, and from what source, may irrigation districts receive the best and the most effective and the least expensive guidance and assistance. Because of their importance to the state, and because of the peculiar nature of and the exceptional conditions surrounding irrigation districts, the state can well afford and ought to extend to them such guidance and assistance as will insure their success. This help should not be extended from any paternal or altruistic motive, and there should be no kind of special privilege involved therein. The participation by the state in these undertakings may well be justified wholly

A TYPICAL LACY "JOB" IN THE IRRIGATION COUNTRY

Lacy Manufacturing Co.

Manufacturers of

Riveted Steel Pipe From 4 Inches to 10 Feet in Diameter

Originators *of Rust Proof Covering for Metal Pipe*

STEEL TANKS OF ANY CAPACITY

Works: Main and Date Sts. Los Angeles, Calif.

Drainage and Flood Control Engineering

By G. W. PICKELS
Assistant Professor of Drainage Engineering, University of Illinois

THIS BOOK COVERS ALL PHASES OF THE DRAINAGE ENGINEER'S WORK FROM THE DRAINAGE OF SMALL AREAS OF FARM LAND BY TILE UNDERDRAINS TO THE RECLAMATION OF LARGE AREAS BY FLOOD PROTECTION, BY DRAINAGE THROUGH OPEN DITCHES AND BY PUMPING.

450 pages, 6x9, Illustrated. $4.00 Net

The marked advance in drainage practice in recent years is emphasized throughout. The sciences of hydrology, hydraulics and soil physics—particularly the results of recent researches—are satisfactorily covered from the specialized viewpoint of the drainage and flood-control engineer.

The book gives a comprehensive and well-balanced picture of drainage practice as carried on today. The economic justification of drainage and flood-control projects is set forth clearly. The legal organization of drainage districts, the essentials of drainage law, and the spreading of assessments make up a final valuable chapter.

upon the basis that it is good business.

The state should exercise its full power to see that an irrigation district project is not created and its bonds issued and sold, unless the undertaking is sound; and, likewise, the state should cause such a project to be successfully completed once it has been created and its bonds sold. The state should provide complete and efficient machinery for properly guiding and controlling the organization of irrigation districts, and for guiding their management, particularly during their formative and construction periods; and, if necessary, the state should be in a position to substitute its own management for that of the district, temporarily, at such times as the directors of the district are unable properly to conduct its affairs.

The state might very well also be in a position to lend its financial support by the purchase of bonds of irrigation districts at the time that the bonds are originally issued. The use by the state of its funds for the purchase of irrigation district bonds could be justified, however, only when the bonds of the irrigation district are unquestionably sound, and when the reputation of the irrigation district is not sufficiently well established to readily command the money of investors. The unwillingness of investors to purchase the bonds of an irrigation district may arise from a general doubt as to the stability of irrigation districts generally or of the particular district itself.

UNDER such conditions as herein suggested, the state would be fully informed as to the strength of the district and would be assuming no risk in purchasing bonds that had been issued by the district with the approval of the state. When the district had become a demonstrated success, the bonds could readily be resold. Thus the state would be reimbursed.

The probabilities are that with wholly efficient participation by the state in the creation of irrigation districts, and in the completion of the projects, there would be no necessity for the sale of irrigation district bonds to the state. All bonds of good repute are readily absorbed by the investing public.

These suggestions do not contemplate that the state shall actually guarantee the success of any irrigation district, nor that the state shall underwrite any irrigation district bonds; rather is it the thought that the state can well afford to capitalize the experience already had and the knowledge acquired, and, by centralizing the use of this experience and knowledge, and through the exercise of the power of which it is possessed, lend to irrigation as a whole a service of immeasurable value.

MODERN Irrigation

Have You a Delegate at This Meeting?

THE COMPETITIVE business world of today moves forward on two wheels. One of these is salesmanship proper and the other—*advertising*. Whether you realize it or not, business amounting to billions is now transacted annually through the advertising pages of magazines and industrial publications. It is *here* that the preliminary skirmish of competition takes place and many a silent victory is won, or nearly won, before the salesman calls.

The advertising pages of MODERN IRRIGATION are a market-place. Here, once each month, is held a sales convention on paper. Here representatives of the leading equipment manufacturers speak their messages to the great market that buys your products.

These "silent salesmen" are an indispensable part of the general campaign; as necessary in their way as is the personal representative who stands between you and your customers, and your prospective customers. Do not, like the fabled ostrich, hide your head in the sand and imagine otherwise. You may, by cultivating such an illusion, go on saving the cost of a monthly advertisement; but if that is your policy you are slowly and certainly losing prestige, business and good will—of a far greater value to you—and making it easy for the more astute competitor, who does not believe in such limitation of armaments, to penetrate your market, overcome advantages which you hold in fancied security, and eventually outflank you on this important sector.

At this moment, the pages of MODERN IRRIGATION are being examined, and examined carefully, by men whose yearly purchases in your line aggregate large sums of money. Long-pull advertising will help you to secure a larger percentage of this annual turn-over. The men who buy are reading and studying these advertisements—never doubt it. Consciously, or unconsciously, they are forming their opinions and narrowing down their ultimate choice of equipment. Many *actual decisions* are made months in advance of the order for the goods. None but the most backward companies in business today are not fully alive to this, while those of seasoned advertising experience are now, as never before, bringing up their advertising artillery for the big year's business ahead.

There will be no disarmament in the business world the coming year—no unpreparedness in the organization of progressive business concerns. Competition will be keener than ever before. The personal skirmishes and "bouts" of your salesmen and distributors in the field will have their counterpart in the drive for business and prestige through the advertising pages. Laggards and sluggards will drop out, and fall by the wayside. Live, up-and-going companies will go forward on "both wheels."

Think the matter over. The monthly meeting on these pages will go right on, month after month, and the silent but efficient emissaries of the leading companies in your line will be present. Your own advertisement gives you representation according to your merits. Why not decide upon a campaign now, and let us talk the subject over with you?

We'll be glad to introduce your "Silent Delegate" at the next monthly meeting.

OVERHEAD IRRIGATION

SOME IMPORTANT PHASES OF OVERHEAD IRRIGATION

By R. O. LEHR

IT IS an established fact that the top twelve inches of the soil colmun is the laboratory in which plant foods are manufactured by the various chemical and physical agencies at work in soils. This zone is the one which is richest in the bacteria responsible for many of the beneficial mild acids which take an important part in this production of plant food. It is the zone which is usually the best aerated and benefited by oxygen necessary in the soil chemical processes, and it is also the zone which is most benefited by the warmth of the sun's rays, which assist both chemical and physical processes of this plant food production. There is another factor of great importance to this zone of activity and that is the moisture element. For the reason that it assists these other agencies at work in the soil, the sprinkler, or overhead system of irrigation, is worthy of analysis.

Better Seepage

The soluble plant foods which have been manufactured in the topsoil by the agencies just mentioned must be washed down into the root zone of the tree before they can be converted into crop. We have learned that shallow furrows in the surface soil send moisture down in a "V" rather than in an "A" and as a consequence much of the soil is left dry, bacterial action is hindered and chemical conditions are not ideal. In addition, these small streams of water run in shallow furrows have had a tendency to carry soluble plant foods to the lower ends of the rows and deposit them there by seepage. This is especially noticeable where slopes are pronounced. The sprinkler system of irrigation is free of these objections. It wets the entire surface, when installed according to recent approved plans. It may be regulated so that there is no runoff to low places, and soluble plant food over the entire area covered by the sprinkler is allowed to seep down into the root zone.

This system will be readily recognized as advantageous on hillside plantings, or where land has not been carefully leveled.

Hillside Irrigation

As a matter of fact, our prime objectin leveling has been to gain easy flow of irrigation water. To gain this we have often scraped off a foot or two feet of fertile topsoil and deposited it in low places already possessed of their foot or two feet of fertile topsoil, with the result of unusual growth of crop in the rich zones and backward growth on the high spots, or scraped areas. Without doubt, in some cases an excellent sprinkler system could have been installed for little more or even less than the cost of difficult leveling, and once installed the frequent cost of furrow plowing is saved, not to mention the cost of covering the furrows after ecah irrigation and the elimination of the man with the shovel to watch furrows and regulate gates.

The question of pressure is one that calls for special solution in each case. It will be determined by the contour of the land itself; and the source of supply will also have to be considered. Some growers will find it necessary to pump directly into their pipe system, others may be fortunately situated with a high reservoir site which may be filled by gravity flow or pumping. It will be appreciated that growers who are supplied under irrigation districts from open ditches will be obliged to install additional pumping equipment to obtain pressure and in taking water from open ditches it must be remembered that screening should be effective in order that the sprinklers themselves may not become clogged with weed seeds or other foul matter. One factor in favor of sprinkling is that it cannot continually replant the land with foul vegetation as is the case with water from open ditches in many sections.

The matter of placing pipe is an important one. The item of trenching and filling trench after pipe is laid has been an expensive one, until recently. An implement has now been perfected which will bury pipe underground to any desired depth not exceeding 26 inches. The cost of this tool is not a serious item, for it can be continuously used each season as a "panbuster" to depths less than the planting distance of the pipe and the deep breakage of the lower soils from its use will benefit soils more than enough to pay for its use. The length of the string of pipe buried at one time is naturally determined by the size of the pipe itself. It is also determined by the power of the tractor available.

Laying the Pipe

More power will be required to bury pipe 24 inches deep than 12 inches deep, for the panbuster is obliged to break through a longer column of soil. The friction, or drag, of the pipe itself through the soil as it is pulled in by the panbuster is not noticeably greater at 24 inches than at 12 inches in depth. I have seen a 10 horse tractor pull with ease 150 feet of ¾ inch galvanized pipe with couplings every 10 feet. A narrow trench is dug at the starting point to permit the pipe to go to its level in the ground without bending at the point of entry.

Where tree connections are to be made it is then only necessary to dig down where the cut-in is to be made. If sprinklers are to be installed over the tree and pipe run up the trunk to be out of the way of cultivating tools, it will be necessary to dig a short trench from tree to pipe line, which is usually in the center of the row. This applies to old orchards. Where trees are very young or not yet planted the supply pipe may be run directly down the marked rows, a post-hole auger may be used where the upright pipes are to be cut in, or cutting in may be done when the hole is dug to set the tree. The company manufacturing the sprinkler used will be able to supply proper reductions for sprinklers to adjust pressure between the supply and discharge ends of the main lines when they are given proper data as to length of rows, spacing of trees, size of mains, and so forth.

We make complete installation if desired

This new Sprinkler will practically last a lifetime. We guarantee it unconditionally for five years.

Oil or grease cup in which adjustable hardened cone thrust bearing operates.

A *New Type* Campbell

Overhead Irrigation Sprinkler

THIS IS THE SPRINKLER YOU HAVE BEEN WAITING FOR — IS PERFECTLY BALANCED, HAS LONG UPPER AND LOWER BEARINGS, LUBRICATED HARDENED CONE THRUST, FELT STRAINERS TO KEEP SAND OUT OF BEARINGS AND MANY OTHER NEW FEATURES.

SURVEY *of* HYDRAULIC DEVELOPMENT

As Shown by Official Records of the Month -- Local, State, and Governmental

Permits Issued

Among the more important permits to appropriate water issued by the Department of Public Works, Division of Water Rights of California, during the month of January, 1926, were the following:

Permit No. 2375, Application No. 4690 (Mendocino County)—Issued to Charles Thomas Smith of Hopland, Calif., for 1 cubic foot per second from Russian River. In Section 33, T 13 N, R 11 W. M. D. M. For use for irrigation of 80 acres near point of diversion. January 4, 1926.

Permit No. 2378, application No. 4559 (Los Angeles County)—Issued to H. Sandberg of Sandberg, Calif. January 11, 1926. For 0.12 cubic foot per second from an unnamed spring. In Section 33, T 8 N, R 17 W. For use for Domestic and irrigation of 80 acres in Sec. 32. Estimated cost $2.500.

Permit No. 2388, Application No. 4685 (San Diego County) Issued to George T. Simpson of San Diego, Calif. January 14, 1926. For 1.69 cubic feet per second and 150 acre feet per annum. From Surface and under flow of Santa Maria Creek in Section 11, T 13 S, R 1 W. For use for irrigation of 135 acres in Sec. 11.

Permit No. 2392, Application No. 4738 (Colusa County) Issued to Martha Wackermann of Grimes, Calif. January 18, 1926. For 0.61 cubic foot per second from Sacramento, Calif. In Section 26, T 14 N, R 1 E. For use for irrigation of 48.98 acres in sections 26 and 27. Estimated Cost $2,000.

Permit No. 2394, Application No. 4766, (San Joaquin County) Issued to California Land Finance Company, of Los Angeles, Calif. January 19, 1926. For 21.2 cubic feet per second from Fourteen Mile Slough, in Sections 24, 30, 29, Tps. 2N, Rges, 5E, 6E. For use for irrigation of 1,702.2 acres near point of diversion. Estimated Cost $33,600.

Permit No. 2398, Application No. 4720 (San Luis Obispo County) Issued to Peterson Farms Company of Los Angeles, Calif. January 21, 1926. For 1.75 cubic feet per second and 10.1 acre feet per annum from Los Osos Creek in Section 20, T 30 S, R 11 E. For use for irrigation of 140 acres.

Permit No. 2400, Application No. 3945 (Siskiyou County) Issued to Christian Bollhorn of San Francisco, Calif. January 22, 1926. For 0.1 cubic foot per second from an unnamed tributary of South Ten Eyck Creek in Section 32, T 12 N, R 6 E. H.M. For use for domestic use and irrigation of 60 acres in Sec. 32. Estimated Cost $500.

Permit No. 2401, Application No. 4636 (San Joaquin County) Issued to Mrs. Anna Bautz, of Stockton, Calif. January 25, 1926. For 1.93 cubic feet per second from Middle River in Section 13, T 1 S, R 5 E. For use for irrigation of 154.6 acres near point of diversion. Estimated Cost $3,000.

Permit No. 2406, Application No. 4730 (Lassen County) Issued to Jay C. Womple, of Milford, Calif. January 27, 1926. For 2.12 cubic feet per second from Mill Creek and 200 acre feet per annum from Mill and Dry Creeks. In Sections 26 and 23, T 27 N, R 14 E. For use for irrigation of 170 acres and stockwatering in Sections 23 and 24. Estimated Cost $2,500.

Permit No. 2410, Application No. 4575 (Tehama County) Issued to P. B. Cross of San Francisco, Calif. January 29, 1926. For 150 cubic feet per second from Deer Creek in Section 5, T 26 N, R 3 E. For use for power purposes in Sec. 5, T 25 N, R 2 E. M.D.M. 18,629 T.H.P. to be developed. Estimated Cost $1,669,648.

Applications Filed

Among the applications for permit to appropriate water filed with the State Department of Public Works, Division of Water Rights, (California) during the month of January were the following:

Application No. 4874 (Santa Barbara County)—J. G. Rinehart, in care of Preisker, Preisker & Goble, of Santa Maria, California, for .73 cubic foot per second from Los Alamos Creek, Tributary to Pacific Ocean, to be diverted in Section 21, Township 8 N, R. 33 W. S. B. M. for agricultural purposes on 58.43 acres in Sec. 21, T 8 N, R 33 W. S. B. M. Estimated cost $2,800.

Application No. 4875 (Siskiyou County)—Henry Fiock of Yreka, Siskiyou County, Calif. for one cubic foot per second from Shasta River, Tributary to Klamath River. To be diverted in Section 20, T 45 N, R 6 W. M. D. M. For agricultural purposes on 55.1 acres in Sec. 17, T 45 N, R 6 W. M. D. M.

Application No. 4876 (San Bernardino County)—L. J. Violette, in care of J. E. Ingram, of 511-12 Metropolitan Bldg., Long Beach, Calif. For 40,000 acre feet per annum. From Antelope Creek, Arrestic Crk., Rattlesnake Canyon, Tributary to Mohave Desert. To be diverted in Section 2, T 1 N, R 5 E. S. B. M. Section 22, T 3 N, R 2 E. S. B. M. Section 19, T 3 N, R 3 E. S. B. M. For agricultural purposes on 11,000 acres in Sect. 30, 31, & 32, T 2 N, R 6 E; Secs. 1, 3 & 5, T 1 N, R 6 E; Secs. 3, 5, 6, 7, 10, 14, 15, 16, 17, 18, 19, 21, 22, 27, 28, & 29, T 1 N, R 7 E. S. B. M.

Application No. 4879 (Los Angeles County)—E. R. Ruiz, R. B. 93, of Saugus, Calif. For .75 cubic foot per second from San Francisquito Creek (Underground Water). Tributary to Santa Clara River. To be diverted in Sec. 27, T 5 N, R 16 W. S. B. M. For agricultural and domestic purposes on 60 acres in Sec. 27, T 5 N, R 16 W. S. B. M. Estimated cost $3,000.

Application No. 4882 (Los Angeles County)—Harrison R. Ward, in care of D. M. Baker, of 1018 Central Bldg., Los Angeles, Calif. For 0.25 cubic foot per second and 73 acre feet per annum. From Sawpit Canon. Tributary to San Gabriel River. To be diverted in Section 13, T 1 N, R 11 W. S. B. M. For domestic and agricultural purposes on 60 acres in Sec. 13, T 1 N, R 11 W. S. B. M. Estimated cost $6,000.

Application No. 4887 (Butte County)—C. M. Faris, in care of Geo. D. Adams, of Box 36, Gridley, Calif. For 13.27 cubic foot per second from Lat. "A", Drainage Canal—Reclamation District 833. Tributary to Sacramento River via Butte Creek. To be diverted in Section 19, T 18 N, R 2 E. M. D. M. For irrigation purposes on 531 acres of rice in Sec. 19, T 18 N, R 2 E. M. D. M. Estimated cost $2,000.

Application No. 4889 (Lake County) W. F. Detert., in care of George A. Elliot, 425 Mason St., San Francisco. For 6.25 cubic feet per second and 600 acre feet per annum from Bucksnort Creek, Tributary to Putah Creek. To be diverted in Section 9, T 10 N R 6 W. M. D. M. For agricultural purposes on 500 acres in Guenoc Rancho.

Application No. 4891 (Butte County)—Henry Kossow, in care of King & King, Attorneys of Gridley, Calif. For 2.0 cubic foot per second from Main Canal No. 833, Reclamation District, Tributary to Butte Creek. To be diverted in Section 21, T 18 N, R 2 E. M. D. M. For irrigation purposes on 80 acres of rice in Sec. 21, T 18 N, R 2 E. M. D. M. Estimated cost $1,000.

Application No. 4892 (Humboldt County)—William Campbell, of Saylor, Trinity County, Calif. For 4.50 cubic feet per second, from Madden Creek, Tributary to South Fork Trinity River. To be diverted in Section 21, T 6 N, R 5 E. H. M. For power purposes in Sec. 22, T 6 N, R 5 E. H. M. 10.7 H. P. Estimated cost $1,200.

Application No. 4893 (San Diego County)—R. E. Rule, in care of Thomas H. King, C. E., 920 8th St., San Diego, Calif. For 30,000 acre feet per annum. Maximum yearly withdrawal, 2,500 acre feet. From San Marcos Creek. Tributary to Pacific Ocean. To be diverted in Section 30, T 12 S. R 3 W. S. B. M. For agricultural purposes on 4,000 acres proposed irrigation district. Estimated cost $400,000.

Application No. 4894 (San Joaquin County)—Matie S. Vail, in care of Levinsky & Jones, of Box 28, Stockton, Calif. For 8.1 cubic feet per second. From Beaver Slough, tributary to S. Fk. Mokelumne River. To be diverted in Section 8, T 4 N, R 5 E. M. D. M. For agricultural purposes on 650.9 acres in Secs. 5, 8 & 17, in T 4 N, R 5 E. M. D. M. Estimated cost $32,500.

Application No. 4896 (Sacramento County)—E. O. Morse of Elk Grove, for 11.56 cubic feet per second from Burton Slough, Mokelumne River and Burton Cut. Tributary to Mokelumne and San Joaquin River. To be

·SNOW·
IRRIGATION APPLIANCES

The Snow Plain Slide Gate

OUR very complete line of modern irrigation appliances includes the two types of high quality, yet low priced, gates herein illustrated. The use of these gates is indicated for the lower heads where an absolutely pressure tight gate is not required.

THE SNOW PLAIN SLIDE GATE is strong, simple in construction, and has faces of both frame and slide accurately machine finished; it is as nearly tight as is possible to make a gate without locking or tightening devices.

Made in sizes 4-inch to 36-inch inclusive.

THE SNOW SLIDE GATE LIFTER, illustrated at the right, is a highly efficient worm gear device for operating Slide Gates, especially the larger sizes, when under considerable pressure. The cost is small.

The Snow Clamp Slide Gate

THE SUPERIORITY OF THE SNOW CLAMP GATE lies in the clamping device which holds the slide securely open at any point, also closes the gate by clamping the frame and slide tightly together, thus making it practically water tight.

Made in sizes 4-inch to 24-inch inclusive.

PIPE

—another year coming

Work interrupted . . time lost . . if your delays were due to faulty irrigation pipe replace it with Montague.

For 75 years Montague has been making **satisfactory** steel products. Montague pipe is designed for you to lay—and **forget!**

Don't take chances this year with unknown piping—insist on Montague—the "pipe-name" that means **service.** Special catalog sent free on request. Write for it.

Montague Well Casing.....5-A
Riveted Steel Pipe.....5-B
Surface Irrigation Pipe.....5-C

We also make a full line of Oil and Water Tanks—Siphons—Stacks and Steel Flumes. Prices sent upon application.

MONTAGUE PIPE & STEEL CO

San Francisco California

More than just a stopping place; a central point from which you enjoy most thoroughly all San Francisco's attractions—the beautiful Plaza overlooking Union Square.

Post St. at Stockton
SAN FRANCISCO

diverted in Sections 16, 20 and 28, T 5 N, R 5 E. M. D. M. For irrigation purposes on 925 acres in Secs. 16, 20, 21, 28, and 29, T 5 N, R 5 E. M. D. M.

Application No. 4879 (Siskiyou County)—Matt Kohn, in care of L. N. Lorenzen of Mount Shasta, Calif. For .08 cubic foot per second from McBride Spring, tributary to Sacramento River Watershed. To be diverted in Section 35, T 41 N, R 4 W. M. D. M. For domestic purposes. Estimated cost $18,000.

Application No. 4898 (Butte County)—Henry D. & E. C. Gage, in care of R. A. Leonard, Attorney, 1st National Bank Bldg., Oroville. For 8 cubic feet per second from Cherokee Slough, tributary to Butte Creek. To be diverted in Section 22, T 19 N, R 2 E. M. D. M. Section 14, T 19 N, R 2 E. M. D. M. For agricultural purposes on 700 acres of rice in Secs. 11, 14, 15 and 22, T 19 N, R 2 E. M. D. M.

Application No. 4899 (Los Angeles County)—1686 W. Adams St., Los Angeles. For 1.25 cubic feet per second and 50 acre feet per annum, from Canada De Los Aliso Canyon. Tributary to San Fernando Valley Watershed. To be diverted in Section 7, T 2 N, R 16 W. S. B. M. For irrigation and domestic purposes on 100 acres. Estimated cost $15,000.

Application N. 4901 Yolo County)—Frank L. Fisher, of 2908 "F" St., Sacramento, for 22 cubic feet per second from Sacramento River, tributary to Suisun Bay. To be diverted in Section 27, T 11 N, R 3 E. M. D. M. For irrigation purposes on 840 acres of rice and 150 acres of beans in Sec. 34 and 35, T 11 N, R 3 E. and Sec. 3, T 10 N, R 3 E. M. D. M. Estimated cost $5,500.

OREGON

Among the more important applications for permit to appropriate water filed in the office of Rhea Luper, state engineer of Oregon, during January were the following:

James D. Fine of Dayville, covering the appropriation of water from Cummings Creek for irrigation of 20 acres in Grant County, at a cost of $500.

Harold R. Shull and Fred Houghton of Wasco and The Dalles, covering the appropriation of water from Grass Valley Creek for irrigation of 17 acres in Sherman County, at a cost of $600.

William S. Skinner of Jordan Valley, covering the appropriation of water stored on Jordan Creek for irrigation of 4,027 acres in Malheur County.

Mrs. Arretta E. Zana of Ashland, covering the appropriation of water from Keene Creek for irrigation and manufacturing purposes in Jackson County.

Alfons Mayers of Blitzen, covering the appropriation of water from Rock Creek for irrigation of 100 acres in Harney County.

William Numro of Condon, covering the appropriation of water from Hay Creek for irrigation of 20 acres in Gilliam County.

Ochoco Irrigation District of Prineville, covering the appropriation of water from Johnson Creek for irrigation purposes in Crook County. (Twenty-five cubic feet per second requested in application.)

T. Wilson of Dufur, covering the appropriation of water from Tamarack Creek (flood and waste water) for irrigation of 20 acres in Wasco County.

John M. Flynn of Lakeview, covering the construction of a reservoir for storage of 32 acre feet of water from branches of Sherlock Gulch, and the appropriation of the stored water for irrigation of 20 acres in Lake County, at a cost of $500.

E. Karlen of Tygh Valley, covering the appropriation of water from Tygh Creek for irrigation of 20 acres in Wasco County, at a cost of $500.

R. D. Pierce of Grants Pass, covering the appropriation of water from The Canyon for supplemental irrigation of 20 acres in Josephine County, at a cost of $200.

J. W. Stringer of Grants Pass, covering the appropriation of water from Rogue River for irrigation of 20 acres in Josephine County, at a cost of $400.

S. T. Overfelt of Imnaha, covering the appropriation of water from Horse Creek for irrigation of 37 acres in Wallowa County.

Henry J. Denn of Camas Valley, covering the appropriation of water from Holmes Creek for irrigation of 60 acres in Douglas County, at a cost of $1,500.

M. M. Burtner of Dufur, covering the appropriation of surplus and flood water from Wolf Run, Tamarack, and Eight Mile Creeks for irrigation of twenty-five acres in Wasco County.

M. A. Pierson of Aurora, covering the appropriation of water from an unnamed creek for irrigation of 19 acres and operation of a ram in Clackamas County.

Power Developments

The Federal Commission at its meeting on January 28 authorized the issuance of the following licenses:

Project No. 233—To the Mt. Shasta Power Corporation of San Francisco, California, a license terminating October 23, 1973 for a power project known as Pit No. 4 on Pit River, in Shasta County, California. The project will consist of a concrete, gravity-type diversion dam forming a small reservoir in Pit River, a tunnel about 4½ miles long, penstocks, and a power house having a proposed installation of about 100,000 Kva. The operating head will be 377 feet. The estimated power capacity of the site is 62,000 horsepower. A transmission line about six miles long will connect the plant with the transmission system of the Pacific Gas & Electric Compnay which will use the power developed in its power system.

Applications for preliminary permit under the Federal water power act filed with the Commission during January included the following:

No. 687: The Oroville-Wyandotte Irrigation District has applied for a preliminary permit for a project on the South Fork of Feather River and tributaries, in Butte and Plumas Counties, California. Alternative schemes of development are proposed, one involving the construction of five power houses with appurtenant works, and the other involving the construction of three power houses with appurtenant works. About 74,625 horsepower is proposed to be developed, for sale to one of the public utilities operating in Northern California.

No. 690: Messrs. Guy T. Stetson and Henry S. Nixon, trustees for the Ojai Irrigation District, Ojai, California, have filed application for a preliminary permit for a proposed project on Sespe Creek, in Santa Barbara National Forest, Ventura County, California, involving the construction of a 180-foot dam designed to create a reservoir of 30,800 acre-feet capacity, a conduit 8.2 miles long and a power house located approximately two miles northeast of Ojai. Any surplus developed power will be sold to public-utility companies operating in the vicinity of Ojai.

Power Commission Reports Great Development in Past Year

Twenty Per Cent Increase Shown in California's Hydro-Electric Capacity

DEVELOPMENT of California's water power resources progressed at an unprecedented rate during 1925. According to compilations recently completed by the California office of the Federal Power Commission new hydro-electric plants with an aggregate generating capacity of 326,000 horsepower were completed and placed in operation during the year. This represents an increase of more than 20 per cent. The total installation of all hydro-electric plants in California is now 1,800,000 horsepower. The tabulation given below shows the present generating capacity of the various public utility and municipal systems of the state.

In a statement issued with this tabulation, the Power Commission declares:

"Congress, in 1920, passed the Federal Water Power Act which provided favorable means for the development of the publicly owned water powers. Most of the power resources in California involve the use of lands of the United States, and hence their development is proceeding under the supervision of the Federal Power Commission. In the five year period since the Act was passed the construction of water power plants has proceeded with such unusual activity that the present installation is more than twice the total capacity existing in 1920.

"The great increase in the power requirements of California is strongly reflected by the large part of the Federal Power Commission's business which involves California projects. Up to January 1, 1926, there had been filed with the Commission 196 applications covering projects in this State. This number represented nearly a third of all the applications from the whole country. The California projects authorized for construction by the Commission up to January 1, 1926 contemplate the installation of over 1,600,000 horsepower. This is almost half of the total capacity authorized by the Commission for the entire United States."

An interesting feature of this tabulation, as presented below, is the close coordination visible between hydro-electric development and irrigation. Many of the large developers of hydro-electric energy listed in this summary are organizations whose first concern is in the development of water for irrigation.

INSTALLED CAPACITY OF CALIFORNIA ELECTRIC SYSTEMS
(AS OF JANUARY 15, 1925)

System	Hydro Plants (Horsepower)	Steam Plants (Horsepower)
Pacific Gas & Elec. Co.	534,779	190,349
So. Calif. Edison Co.	470,715	287,280
Great Western Power Co.	175,334	44,220
City of Los Angeles	124,888	
San Joaquin Lt. & Pr. Corp.	114,088	72,427
City of San Francisco	111,220	
Southern Sierras Power Co.	99,530	17,580
California-Oregon Power Co.	78,200	
Western States Gas & Elec. Co.	44,388	13,401
Los Angeles Gas & Elec. Corp.		167,500
Turlock-Modesto Irrigation Dists.	25,460

A Money-Making Opportunity for *The Right Man...*

SOMEWHERE in Southern California is a manufacturer's representative (or a firm representing several manufacturers) who knows a money-making line when he sees one.

Moreover, he (or the firm) has the other qualifications necessary to afford thoroughly efficient, satisfactory representation for a fast-selling specialty now used as standard equipment in both the water works and irrigation industries. Thousands are being bought and used, wherever water is pumped. The turn-over is rapid, the profits large.

But the representative, too, must be A1, with a sales record that speaks for itself. The Southern California territory alone is far too important to justify appointment of anyone but a man (or firm) of season experience, amply financed and thoroughly versed in the terminology and language the pump owner and operator.

If you feel that you can "measure up"—and your record and standing will be investigated carefully—get into communication at once with: Box XYZ, care Modern Irrigation.

AMONG OUR CONTRIBUTORS

Editorial Jottings About Current and Forthcoming Feature Articles, Dealing With Practical Problems of Hydraulics, and the Men Who Have Written Them

PROBABLY no man in the world is better qualified, by experience and official position, to discuss such a subject as "Fire and Water" from the standpoint of the effect of forest fires on water supply than E. N. MUNNS, who has written the article under that title in this issue.

For the past fifteen years Mr. Munns has been studying the relationship between fires and forests, and the correlative relationship of water supply to these factors. He was graduated in 1911 with the degree of Master of Science in Forestry. He spent one year in the Shasta National Forest, in California, on timber estimating, tree studies and fire protection; and in 1912 was assigned to the Angeles National Forest, with his headquarters in Los Angeles, California, where he had charge of nursery, planting and experimental work.

His service in this capacity was so marked that he was given charge of the Converse Forest Experiment Station and until 1918 directed all forest research work in Southern California on the Santa Barbara, Angeles, and Cleveland National Forests.

During 1918 and 1919 Mr. Munns served with the War Industries Board in charge of the lumber production division. Returning, in 1919, to California, he was assigned to San Francisco, in charge of research work throughout the state. In 1921 he was "loaned" to the state of California by the Forest Service and spent two years in the study of flood and erosion problems in California. In 1923 he resumed his work in the Forest Service, being stationed in Washington, and now has charge of all the silvical research work of the Service in the United States. He is the author of numerous articles in the technical and popular press on forestry subjects, and of several official bulletins.

A LEADER in the hydraulic development of the northwest, and one who is taking a prominent part in the preliminary negotiations leading to the development of the Columbia River's water resources, is R. K. TIFFANY, who has written the article on this issue entitled "How Water is Controlled and Administered in a State that Has Plenty of It." Mr. Tiffany is state Supervisor of Hydraulics in the state of Washington. Certainly there is no one better able to discuss this subject than he.

PROFESSOR FRANK ADAMS' article is the second installment of a very valuable paper which he contributed at the recent meeting of the Western Division of the United States Chamber of Commerce, at which he had charge of that part of the program dealing with water conservation.

ADDISON T. SMITH has contributed to the pages of this magazine before, and is no stranger to the irrigation industry. When he was a young man in Idaho he became acquainted with the needs of western arid lands, and convinced of the wisdom of federal reclamation. He was then serving as secretary to Senator Shoup of Idaho. Through the succeeding years, as register of the land office at Boise, and as secretary to Senator Heyburn, he retained his interest in reclamation problems, and when he was elected as a Representative in Congress from Idaho in 1912 he had opportunity to put into practice his convictions. In ten years of service in Congress he became chairman of the committee on Irrigation and Reclamation, which position he still holds.

E. N. MUNNS

The camera caught Mr. Munns in a dour moment—possibly when he was gazing upon the ruins in the wake of a severe mountain rainfall and run-off.

FRED A. NOETZLI, who describes the very interesting experiments undertaken by the Engineering Foundation in the construction of the test dam on Stevenson Creek, is secretary of the foundation's committee on arch dam investigation. His headquarters are in Los Angeles. HUGH CRANE, writer of the article discussing the activities of the Western Irrigation Equipment Association, is a staff contributor.

DEPARTMENTAL contributors to this issue are men of prominence in their several fields. A. P. LOVELL is Superintendent of Water for the City of San Diego, California. He is one of the leaders of water works development in the west, and his department is the first city water department on the Pacific Coast to make practical investigations of cement lining for cast-iron pipe. In a personal note to the editor he expresses confidence in the merit of this type of lining for the solution of the special problems which it is designed to meet, and the conviction that, in time, as city officials become familiar with the practical side of this matter, it will have a wide acceptance.

"Interpreting Engineering as a Fine Art" is reprinted from the admirable San Joaquin *Power Magazine*, published by the San Joaquin Light and Power Company, to which acknowledgements are due for permission to reproduce both the article and the accompanying cuts. SIDNEY GREEN, writer of the story, is associate editor of the publication.

GEORGE H. KREUTZER is well known as an expert in that very important side of reclamation—its economics. He is connected with the Bureau of Reclamation as Director of Reclamation Economics. W. R. WILLIAMS, as an executive of the great Bank of Italy, represents a financial institution which has manifested a practical interest in reclamation and irrigation developments. R. O. LEHR is associated with the Killefer Manufacturing Company, Los Angeles, and through several years of study, observation and experience with overhead irrigation, has acquired a valuable fund of knowledge on many aspects of this new and interesting subject. His short article in this issue touches on only two or three points in this connection; in the next issue of the magazine he will continue the discussion.

The March issue of the magazine will discuss some very interesting developments in the fields of irrigation and water works. "How Irrigation Has Created a New Industry" will be the subject of an article in an early issue, written by DONALD MITCHELL, who is connected with the Date Growers' Association at Indio, California, and who will discuss some interesting phases of this new orchard crop whose development into one of the agricultural industries of the west has been made possible entirely through irrigation. E. K. BARNUM, superintendent of the City Water Corporation of Fresno, California, has written a valuable technical article on balancing reservoirs, which will appear in the March number.

TABLE OF CONTENTS

FOR MARCH, 1926

THE PROGRESS OF IRRIGATION—A BRIEF SURVEY OF THE IRRIGATION HORIZON 9

GENERAL FEATURES

FRONTISPIECE—*M. C. Hinderlider* 8

IRRIGATION CREATES A NEW INDUSTRY ..... By Donald Mitchell 11
The Tropical Coachella Valley, in Southern California, is the Scene of a Picturesque Evolution, as an American Date Culture Comes into Being.

AN "OUTLINE OF IRRIGATION" ..... By W. W. McLaughlin 13
The Associate Chief of the Division of Agricultural Engineering Tells how American Irrigation and the Service of His Organization Have Simultaneously Developed.

THE RIDDLE OF THE RIO GRANDE ..... By C. H. Pease 15
"Where is the Water Coming From" is the Question that Worries Texans as Mexican Appropriations are Imminent and their Continuity of Supply is Threatened.

SUPPLEMENTING PUMP CAPACITY ..... By E. K. Barnum 16
A Scientific Discussion of How Pumps Can Best be Supplemented by Balancing Reservoirs, By the Engineer of the Fresno (California) Water Corporation.

IDAHO AND WASHINGTON IRRIGATION CONGRESSES MEET 18
Problems of Reclamation and Irrigation in the Northwest are Discussed before Societies of Two States in Annual Sessions.

WHAT IRRIGATION HAS DONE FOR COLORADO ..... By M. C. Hinderlider 19
The Service of Artificial Water Development to this State is Told in Engaging and Authoritative Style by Colorado's State Engineer.

RECENT COURT DECISIONS 22
Introducing a New Department Devoted to the Legal Progress of Irrigation in the in the West.

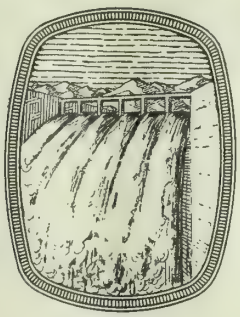
PETROLEUM WORLD 626 S. SPRING ST., LOS ANGELES, CALIF. MODERN IRRIGATION

M. C. HINDERLIDER

State Engineer of Colorado, who in this issue tells of the consummate importance of irrigation to that state. He speaks from the vantage point of twenty-five years' experience in the practical development of water supplies throughout the southwest for irrigation, municipal and power uses. In his article, he pays high tribute to the work of Colorado's irrigation pioneers, and declares that the whole basis of Colorado's present wealth and future greatness is to be found in the artificial application of water to its agriculture.

MODERN Irrigation
The Magazine of Applied Hydraulics



Volume II MARCH, 1926 Number 3

The Progress *of* Irrigation

WILL the sixty-ninth Congress, after all its hearings on the subject of the Colorado River, actually decide upon any form of constructive action in the matter before adjournment? Observers of the Washington situation may be found who declare, with seeming evidence to justify the opinion, that the outlook for definite action is really more encouraging (to the advocates of the plan embodied in the Swing-Johnson measure) at the present time that it has ever been during the whole long tedious course of agitation and negotiation.

Secretary Hoover, testifying early in March before the house committee on irrigation and reclamation, made a statement which is described, by press reports, as a strong endorsement of the bill, without the modifications suggested by Secretary Work, whose report several weeks ago identified the Colorado River development officially as an "administration" measure. Secretary Hoover told the committee that there is urgent need for immediate action, and that the recalcitrance of Arizona should not be allowed to delay the decision of Congress. Arizona's rights, he held, are amply protected in the bill.

Sunset Magazine, which has recently devoted a good deal of editorial attention to the Colorado River, from the attitude of a supporter of the Swing-Johnson plan, sees in the statements of Secretaries Work and Hoover ground for substantial encouragement. In its March issue it declares: "It is apparent that the federal government is going to proceed with the development anyway. . . . Secretary Work of the Interior Department has submitted to the senate committee on irrigation and reclamation a report recommending that the federal government build the dam when six of the Basin states approve the Colorado River pact. . . . Secretary of Commerce Hoover is in favor of building a dam in the Colorado River, and it is known that President Coolidge supports the proposal. . . . After many years of weary delay it now seems that the turbulent Colorado River will be tamed and made useful to the great, growing west that needs its water and the cheap electric energy its water can create."

Arthur Bent, newly elected president of the Los Angeles Chamber of Commerce, threw the influence of that organization strongly into the balance late in February when he addressed tele-

grams to both of the secretaries, urging that no "last-minute" modifications or amendments should be allowed to interfere with action on the measure at the earliest possible moment.

ON THE OTHER hand, however, the opponents of the Swing-Johnson bill are able to discern in the present congressional situation very significant indications that the present Congress may debate its oratorical way to adjournment without doing anything with the Colorado River. The amendment, suggested by Secretary Work, providing for a federal bond issue of $125,000,000, has given the opponents of the measure a new line of attack. They now contend that this provision for revenue raising must constitutionally be approved by the House of Representatives before it may come before the Senate for consideration. Should they be sustained, the Senate committee would give the bill no further consideration until it is passed in one form or another by the House.

The continued unwillingness of Arizona to ratify the Colorado River Compact also remains a potent force of delay.

All things considered, action during the present session of Congress is a very speculative matter, with the odds apparently against those who are anxious for immediate approval of the bill.

HEAVY RAINS in parts of the west which had feared a water shortage in 1926 have resulted in a general spirit of optimism and encouragement in irrigation and agriculture, and this has been reflected in business of all kinds. Throughout California, where the water shortage seemed most threatening before February's storms, the rains have been general, and while in most sections the seasonal total still lacks something of the normal, it is so far above the corresponding mark recorded a year ago that thanksgiving and confidence in improved water conditions for the summer season are widespread.

In many mountain points the snowfall has actually gone above the normal point for this time of year, and has assured an abundance of run-off for irrigation and power later in the season. In the Owens Valley, from which a large part of the municipal water supply of the city of Los Angeles is derived, a surplus of water is in prospect. More than eight feet of snow is standing in the Sierras above Bishop.

An appreciable stimulus has been given to business activity in California by the *volte-face* of the water outlook. A Los Angeles banker, commenting on the quickening of the commercial pulse in the last thirty days, told the story of a farmer who applied to his bank for a loan late in January, and was refused accommodation. In February, after the rains, with optimism general and a new spirit already manifesting itself in both retail trade and finance, the banker advised the applicant to renew his request for the loan, feeling that perhaps the change in conditions might make his proposition more "bankable." To the surprise of the farmer, the loan which had been refused three weeks before was this time readily granted. This is typical of the results which the rain has brought, not alone in Southern California, but throughout the state.

Capital which was beginning to tighten, under the influence of an imminent "dry year," has been released from tension, and is available for irrigation expansion, larger plantings, the purchase of equipment and similar improvements.

IRRIGATIONISTS of Idaho and of Washington met in their respective irrigation "congresses" in February, at Pocatello and Yakima. These periodical meetings are excellent things for irrigation in general and in particular the sections which they represent. Both organizations are planning worth-while constructive activities for the coming year.

Warren G. Swendsen, who has been president of the Idaho Irrigation Congress for the past year, in his message to the organization at the annual meeting, brought forcefully before the membership a question which needs periodically to be asked of every similar body. He said: "The last session of the Idaho Irrigation Congress did me the honor of electing me president, and since that time I have given no little consideration to the question of *what excuse exists for the organization*—whether or not, after all, we are justified annually in attending these gatherings and spending our time and money to engage in them?" From that point, his message was a keen analysis of the needs of Idaho from the standpoint of irrigation, and a careful discussion of what practical service may be rendered by such an organization as the Idaho Irrigation Congress. Mr. Swendsen is right; his example may profitably be emulated by the executives of all such bodies, not only in irrigation, but in every other field. Unless we constantly evaluate our organizations in terms of their service, they soon come to dominate those who have created them.

Mr. Mitchell, author of the accompanying article, caught in the midst of one of the date gardens that he writes about. The photograph illustrates the basin system of irrigation generally used in date culture.

How *Irrigation* is Creating a *New Industry* in the *Hot Spot* of the *American Desert*

By DONALD MITCHELL

IN THE Coachella Valley of California, that portion of the Salton Sea Basin lying north of the sea itself, are found conditions very different from those generally encountered in the agricultural west. Before the advent of the irrigator with his magic water, the valley was a desert, with mesquite and sagebrush as its principal vegetation. Now thousands of acres of cotton, onions, peas, string beans and other vegetables are found, as well as thrifty orchards of grapefruit and picturesque date gardens. The transformation wrought by water during the last quarter of a century is little short of marvelous. In spite of a rainfall of one to four inches annually, the Coachella Valley farmer raises bumper crops of fruit and vegetables and ships them all over the country.

High mountains form the western wall of the valley. The two most prominent peaks, San Gorgonio and San Jacinto, tower over 11,000 feet into the air and carry snow caps the year around. Melting snow and rainfall from this range feeds the underground reservoir which underlies the whole valley. Wells make this water easily available with lifts of from 30 to 150 feet. Some of the larger ranches have installed semi-diesel engines for pumping and are finding them highly satisfactory, but the bulk of the water is pumped by electricity furnished by the Southern Sierras Power Co.

PROBABLY the most interesting, and certainly the most picturesque crop of this unique region, however, is the date.

The intense heat of the summer and the customary absence of rain during the ripening season combine to make the Coachella Valley an ideal locality for growing dates. The date palm, though thriving in most parts of California, will not produce good fruit except under the most favorable conditions. This fact limits the commercial production of dates in this country to a very small area.

About 25 years ago, largely through the efforts of Dr. W. T. Swingle of the United States Department of Agriculture, the federal government was induced to conduct experiments in date growing to see if the barren deserts of Arizona and California could not be made productive. Scientific men went to the date growing regions of the old world and secured offshoots from the best varieties to be found. These were brought to this country and planted in selected places and their growth studied. The early years of the industry were filled with many problems and disappointments and the courageous souls who gave their time, money, and in some cases their lives to the difficult task of pioneering a desert country in order that a new industry might be brought into being, deserve prominent places in the agricultural Hall of Fame.

At the present time, date growing has passed the experimental stage and is recognized as a practical and profitable undertaking. More progress has been made, it is claimed, by growers in this country in the last 20 years, than has been made in the Old World in many

A maturing crop in the Coachella Valley. The dates ripen from September to December, and in the harvest season the visitor may imagine himself transplanted to the Sahara or Mesopotamia. The outer layers of fruit must be protected, lest they ripen too early, by the fiber covers that are visible in this photograph.

centuries. Our growers have been successful in solving problems that seemed at first insurmountable and are convinced that a most alluring future lies ahead.

When a date garden is planned, offshoots from a variety that is recognized as being commercially valuable are secured and planted, usually 30 feet apart each way. The Deglet Noor is by far the most extensively planted, with the Khadrawi, Saidy, Halawi, Tazizazoot, Maktum, and Thoory forming most of the balance. The planting of date seed and seedling offshoots has been largely discontinued as being unprofitable.

Offshoots are removed from the mother palm by means of a huge chisel and a sledge-hammer. This operation must be carefully done and experts in this work are in demand during the planting season. The first few weeks after setting out, the young offshoot is irrigated daily or every other day until it is well established. There seems to be no case on record where the date palms on well drained soil have been injured by too much water. As the palms grow older the irrigation interval usually used seems to be twice a week in the summer tapering off to once a month in the winter. Cultivation after each irrigation is not necessary as the sandy nature of the soil prevents the forming of hardpan.

SEVERAL systems of irrigating are in general use. Some water the entire area between rows by means of furrows, others make one furrow paralleling each row and fill basins dug around each palm. These basins are enlarged as the palm gets older. This system is sometimes changed to the check system when the trees reach full bearing.

Cost of water varies greatly due to differences of soil, lift, pumping equipment, and irrigating practices followed, but should range between $25 and $50 per acre per year. There are a few flowing wells in the lower part of the valley but with increased acreage going into cultivation each year it is thought that they will eventually be put on the pump.

A male blossom is tied loosely in the heart of the female palm in order to insure successful pollenation. This is one of the male blossoms.

Fertilization is now the subject of study and experiments. The desert soil is rich and few growers apply fertilizers during the early life of the palm, but with the production of a heavy tonnage of fruit year after year comes the problem of maintaining the proper condition of soil fertility. Cover cropping is growing in favor as humus and nitrogen are two things most desired. Melilotus Indica and the vetches have been used with success. Barnyard and sheep manure have also been tried and found profitable but a recognized best method of fertilizing date palms has not yet been developed.

During February and March a visitor to the valley will observe the date grower busily engaged in pollinating. In order to secure a good setting of fruit the grower must assist nature and apply pollen from the blossom of the male palm, which bears no fruit, to the female bloom and tie it loosely with a string. A ladder that comes to a point at the top has been found well adapted to this work, as it is easy to thrust upward through the leaves when it is necessary to reach a bloom at the center of the palm. At this time of the year, at least, it can be truthfully said that the life of a date grower has its ups and downs.

The date palm is comparatively free from pests and natural enemies. The only one that gives the grower much concern is the Parlatoria scale. This pest was brought over from the old country upon offshoots. It has been the object of an active campaign for several

An "Outline of Irrigation"

An Account of Reclamation Development in the United States as Reflected in the Evolution of the Division of Agricultural Engineering

By W. W. McLAUGHLIN

Associate Chief, Division of Agricultural Engineering, Bureau of Public Roads, U. S. Department of Agriculture

AT THE BEGINNING of the concluding decade of the last century, irrigation was in a rather chaotic condition. There was a confusion of water laws, a complete lack of uniformity in the procedure of acquiring title to the use of water, and a questionable security of such title when obtained. There was no provision for land settlement, selection of settlers, farm financing, or marketing of farm products, and speculation was general.

It was at this time that Congress undertook the work that finally resulted in the formation of the present Division of Agricultural Engineering of the Bureau of Public Roads of the Department of Agriculture. In the early nineties Congress provided for an irrigation inquiry, and undertook in 1896, the formation of the Division of Irrigation Investigations, "for the purpose of collecting . . . valuable information and data on the subject of irrigation and publishing the same in bulletin form."

The scope of these investigations was broadened by subsequent enactment as the demand for information on irrigation became more general. There had also arisen in the humid region a demand for information on land drainage. As a result of improper use of irrigation water in the older irrigated sections of the West, areas of land which at one time had been most productive, became too wet to permit the growth of any crops other than hay, or too alkaline to support plant life, or both. This demand, coupled with the drainage problems of the humid sections, led to the creation of a drainage office associated with the irrigation investigations. The work was finally designated as irrigation and drainage investigations under the Office of Experiment Stations. In 1907 Dr. Elwood Mead, who had been in charge of the investigations since 1898, resigned his position and Dr. Samuel Fortier, who for some years had been associated with the work, was made chief of the irrigation investigations. Charles G. Elliott was placed in charge of the drainage investigations, being succeeded in the position a few years later by S. H. McCrory.

In 1914 Congress consolidated irrigation and drainage investigations, the Division of Rural Architecture and one or two other minor divisions in an "Office of Public Roads and Rural Engineering," and later, when federal aid in road building was provided, this form of organization became the Bureau of Public Roads with a Division of Agricultural Engineering, the present form under which we are now working.

THUS FROM a simple inquiry into irrigation practice there has developed a division covering the entire field of agricultural engineering. This Division deals not only with problems of developed enterprises but also with problems of organization and development.

MR. McLAUGHLIN presented a most interesting paper to the Idaho Irrigation Congress, meeting in February at Pocatello, taking as his subject the work of the Division of Agricultural Engineering, of which he is Associate Chief, as it touches reclamation and irrigation affairs. The accompanying article is taken from the first part of his paper, in which he takes up the historical background of the Division's organization and the extent of its present activities. In a future issue of the magazine he will continue the discussion, dealing with the special fields in which the efforts of the Division will probably be directed in the future.—EDITOR.

The majority of the investigational work has to do, however, with those problems common to developed and going enterprises.

The natural and economical course of development in most irrigated valleys has been the construction of small, cheap ditches to water the low lands first, to be followed later by larger, higher, and more expensive works. As a result, in many valleys there is a paralleling and duplication of ditches, and opposition of rights, which lead to excessive costs of maintenance and operation, extravagant loss of water, wasteful use, and conflicts over water, where there should be a unifying and rebuilding of ditch systems and a community of rights. A revision of irrigation systems offers fully as good an opportunity for agricultural expansion in the arid region as the construction of new works.

As water becomes more valuable, there is a need to improve conduits of all kinds so as to prevent losses of water, as well as forestall injury to the land.

All these lines of work with old lands involve questions of agricultural practice and organization as well as construction, and deal principally with private irrigation works which supply practically all such lands.

During the past thirty years the Division of Irrigation and later Agricultural Engineering has done much to improve irrigation and drainage practice, stimulate economic use of water, decrease water waste and in general guide the farmers in coping with reclamation problems of both east and west.

LET US review briefly the irrigation development of the west from the settlement of Utah in 1847 to the beginning of the speculative period in the eighties. For a little more than a third of a century, following the first settlement in Utah, development and settlement spread gradually. During this time the Middle West was settling and there was no great demand for irrigated lands. Development was normal, canals being built as they were needed and not far in advance of settlement.

About 1880 attention was attracted to the success of irrigation in the arid region, and led on by the great increase in land values, due to irrigation, capital rushed into this field and a great many large canals were built far in advance of any effective demand for land. The ditch builders could not secure title to the land covered, because it was public land and could be secured only by settlers and in small tracts, but the investors hoped to secure the increase in land values indirectly by selling to the settlers so-called "water rights." The settler could acquire land from the Government through the homestead act or by means of the desert-land entry, but a home could not be maintained on these arid lands without irrigation water. For this reason the promoter thought the settler could not do without him. He overlooked the fact that he could not do without the settler; that the settler had only to stay away and the canal builler had only a ditch, the cost of maintaining which would soon exceed its cost of construction. And the settlers did stay away, or came so slowly that most of the large canals were financial failures.

The building of so many canals had other effects. It proved the inadequacy

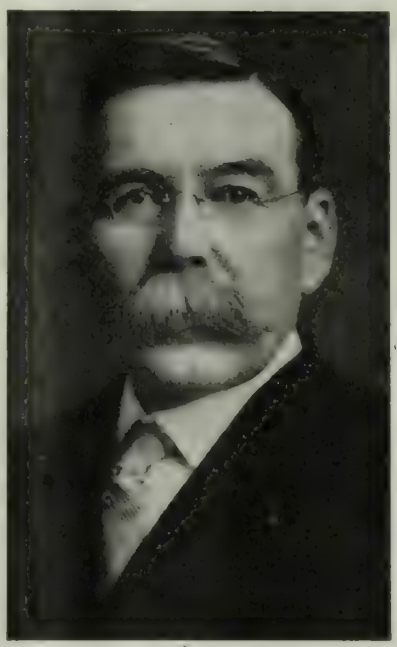
of the water laws of the Western States. Most of these States early recognized the right of appropriating or diverting water from streams for beneficial use and that among appropriators the first in time was the first in right, but they did not provide a means of determining the extent or date of appropriations, or any agency for protecting the earlier appropriator against later comers. Along many streams the capacity of the canals built exceeded the flow of the streams.

In the eighties and early nineties irrigation and canal companies made no attempt to base water charges upon land productivity and the quantity of water allotted was found upon the judgment or whim of the engineer, project manager, chief financial representative, or any one else that might at the time care to express an opinion. One of the first tasks undertaken by the Division of Irrigation was the study of laws and customs of the several states governing the appropriation and use of water for irrigation. There were two fundamental principles in force differing materially in their provisions. One was based upon the right of priority of appropriation and use, and the other upon the English common law doctrine of riparian rights. Some of the states had by constitutional provisions adopted one law while other states had adopted the other, and still other states had adopted no special water legislation but relied upon the common law. As a result of our studies of laws and customs the Division urged the adoption by the several states of certain fundamental principles to govern the acquiring of water rights and maintaining titles thereto. These principles are now reflected in the laws and customs in nearly every one of our western states.

There were practically no laws governing drainage reclamation and the present state laws are for the most part based upon recommendations of this division. The district reclamation acts, which are largely the outgrowth of the California Wright Act, likewise reflect the suggestions of this Division.

The early measure of the quantity of water attached to a claim was most frequently determined by the size of the ditch with little or no reference to the area of land under the ditch, and for this reason the right was indefinite. There was gradually written into the water acts or recognized in court decisions, or both, as the measure of water rights such terms as "beneficial use," "reasonable use," and at present "economic use." These changes in the laws and customs governing the measure of a water right are due almost entirely to work done by this Division and its cooperating agencies in determining the value of water in crop production and the requirements of both crops and soils for water. Our studies on the duty of water or water requirements did not stop with the kind of crop grown and nature of soil, but included seepage losses in conveying water to the farm and losses due to faulty irrigation practices.

AS UNAPPROPRIATED water became scarcer and more expensive to obtain, or where water was at too low an elevation, there was created a demand for information on pumping appliances and equipment. Congress provided, early in the work, for a study of power used in irrigation. This Division made a survey of existing plants, efficiency tests of engines, pumps and other equipment, as well as a comparison of the cost of pumping water with different machinery and using various sources of energy. The results of these tests and investigations were published from time to time and resulted in a more or less standardization of certain equipment and methods of installation.



SAMUEL FORTIER

Prominently identified with the development of the Division of Agricultural Engineering, and head of its irrigation activities from 1908 until his recent retirement from the position.

The old crude method of determining quantity of water and defining it as the amount that can be carried through a flume of so many square inches cross-section, or a ditch so wide and deep has gradually given way to the adoption and use of a more exact method of water measurement. Many contrivances were advocated by many people and agencies and from these a very few have become standard. The use of certain water measuring devices has long been advocated by this Division, as has also the idea of measuring water used on individual farms and fields. This Division is at present perfecting a device to be installed in canals and ditches for the accurate determination of the quantity of water carried by the canal or ditch.

A great many irrigation schemes have failed through the inability of the settlers to meet the imposed terms and unforeseen conditions that might have been foreseen. Many reclamation projects which were unsound economically have been planned and promoted, and it is such schemes and projects that have caused a considerable part of the difficulties of irrigation development. In many cases no attention was paid to the productivity of the soil or differences in productivity within the same project, no thought given to the ability of the soil to produce sufficiently to meet the terms of payment or to warrant the expenditure of that amount of money in its development. Areas of land were included in such projects that never could pay for their development and through their failure imposed additional burdens on the better lands. The larger area was frequently included under a ditch to cut down the apparent per acre cost of development.

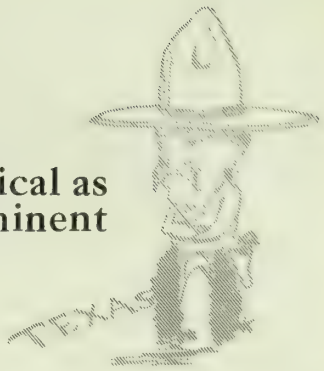
Still other projects failed or partly failed for various other reasons and these failures could frequently have been foreseen had the conditions been properly analyzed. Numerous projects have succeeded and in the past few years we have done much to determine the different factors pointing toward success as well as those pointing toward failure. It has been our aim to determine some of the fundamental economic conditions that must be taken into account if we are to judge correctly the agricultural and economic feasibility of a reclamation project. During the last two or three years this Division has been called upon to make agricultural and economical reports of proposed projects by the Bureau of Reclamation and by the Certification Commission of some of the western states.

These economic and feasibility studies have emphasized the fact that there was, until recently, an unoccupied field between the work of the engineer and the work of the agriculturist. Experience has shown that this unoccupied field was vital in many cases to the success of the project. This is the field this division occupies in reclamation development, the one of combining engineering and agriculture in their economic relation to practical farming. Our studies have shown the importance of weighing the income against the cost; of trying to increase the one and decrease the other.

(*Continued on Page 28*)

The Riddle of the *Rio Grande*

Question of Division of River Water is Critical as Large Mexican Developments Appear Imminent



By C. H. PEASE
Secretary, Lower Rio Grande Valley Water Users Association

TWO PARTS—PART ONE

THE WAR WITH MEXICO began down in the Delta region of the Rio Grande. It was the title to this far-away section that was the immediate cause of the war. Texas asserted that its southern boundary was the Rio Grande, while Mexico contended it was the Nueces River, which enters the Gulf in the vicinity of Corpus Christi, some 150 miles farther north. When the United States annexed Texas, it annexed this boundary dispute also. General Taylor marched down the coast from Corpus Christi to take possession of the lower Rio Grande country and met the Mexicans at Palo Alto, where he fought the first battle of the war.

For more than a half century this land lay almost forgotten. Then a railroad penetrated the Delta and development began. Today this most southerly area is also one of the most promising irrigated districts in the United States. It has nearly a million cares of fertile, alluvial lands suitable for irrigation. At the present time there are over 400,000 acres under fifteen projects, of which over 250,000 acres are now actually being cultivated and irrigated. A population of approximately 100,000 is supported by the industries of the Delta and all of these are dependent entirely upon irrigation.

Millions of dollars have been invested in irrigation equipment and tens of millions in farms and farm equipment in the valley and the values of all of these are dependent upon a water supply from the Rio Grande. There are 500,000 acres of the most productive land in the world still to be brought under cultivation if, and when, a sufficient water supply can be obtained.

BUT THE RIO GRANDE is not the exclusive property of the United States. Being the boundary between the United States and Mexico, it is the joint property of the two nations and subject to their joint jurisdiction. Mexico has a very large area of land in the Delta, probably fully as large and fully as desirable as any land on the north side of the river. Thus far, however, she has made very little use of Rio Grande water. Outside of a few small individual enterprises, there is practically no irrigation on the Mexican side.

Some very important questions are now arising out of this international situation. How much of this water can the United States safely appropriate with the assurance of retaining permanent title to it? How much of this water will Mexico claim, and how much is she entitled to?

There are other facts demanding consideration. The total annual flow of the Rio Grande at Brownsville, under present conditions, with everything being shut off above the Elephant Butte dam in New Mexico, averages around 5,000,000 acre feet. But most of this water is discharged at seasons of the year when there is little use for it. There is a period of low water in the Spring, at the time of peak demand, when the flow sometimes dwindles to 1,000 or 2,000 second feet. This is about sufficient to meet the ordinary requirements of the present cultivated area. There are from 100,000 to 200,000 acres under the various systems in the delta yet to be brought under actual cultivation, and there is considerable doubt of there being sufficient ordinary flow to meet the needs of this additional area.

No arrangements have been made with Mexico for building storage or diversion dams on the Rio Grande. Consequently, all irrigation at present is dependent on the normal flow, lifted out of the river by pumping, the lift varying from 15 to 60 feet. There is no way to increase the water supply by storage except through arrangement with Mexico which will make provision for some kind of international system of river control.

About two thirds of the Rio Grande water-shed (below Elephant Butte dam) lies in Mexico. Development in the delta region is, therefore, waiting for some understanding with Mexico which will permit the development of an additional water supply through storage.

There are no existing treaties with Mexico which contemplate irrigation from the Rio Grande below Fort Quitman, a point about 70 miles below El Paso. The treaty of Guadalupe Hidalgo, which disposed of questions arising out of the war with Mexico, explicitly declares the Rio Grande to be a navigable stream, and prohibits any interference with its use as such. Under a strict interpretation, therefore, it would seem that any diversion of the water for irrigation is in actual violation of this treaty.

THERE IS A TREATY with Mexico, however, which undertakes to determine Mexican and American rights in the Rio Grande down to Fort Quitman, and which gives Mexico the right to 60,000 acre feet delivered to her free of charge from stored water in the Elephant Butte. The treaty contains a stipulation explicitly denying that the United States admits any right on the part of Mexico to water originating in the United States.

This treaty was negotiated for the purpose of settling Mexican claims to water which had been used by Mexican citizens at Juarez for a hundred years before its source, the Rio Grande, or a portion of it, passed under the jurisdiction of the United States. Denying any legal right, the United States tacitly admitted an equitable right, by consenting to supply the Mexican needs from water stored at the Elephant Butte Dam.

About a year ago the citizens of the Rio Grande Delta brought to the attention of Congress the facts of this perplexing situation. Congress authorized the creation of a joint commission to cooperate with a similar commission to be appointed by Mexico, to study the equitable use of the waters of the Rio Grande. The American commission was appointed, consisting of Dr. Elwood Mead, Commissioner of Reclamation, as chairman, Gen. Lansing H. Beach, retired Chief of Engineers, U. S. Army, and W. E. Anderson, of San Benito, Texas.

CHART C—A graphic picture of the average hourly load curve for three maximum days of 1924, showing the required storage for the period of peak demand.

Supplementing *Pump Capacity* With *Balancing Reservoirs*

A Discussion of the Problem of Meeting Peak Demands With an Auxiliary Supply

By E. K. BARNUM*

Engineer, Fresno (California) City Water Corporation

IN CITIES where the topography is more or less level, and natural elevated storage sites cannot be obtained, the question of meeting the maximum hourly demand with pumps or gravity water becomes a problem of designing the works to meet the peak conditions or to supplement the above with stored water, from elevated tanks or surface reservoirs with booster pumps. In the former case a large investment in major equipment results, with corresponding fixed charges often passing the economic limit, while, in the latter case, we are confronted with the problem of balancing annual operating expense, plus fixed charges on our pumping equipment, against that of meeting the peak demand or a percentage thereof, with stored water from balancing reservoirs.

As the economics of the problem require a careful study of load factor conditions, on each particular system before storage capacity should be decided upon, this phase of the problem will be touched upon but briefly.

A hypothetical water works plant will be considered, and a method outlined, as a suggested method of determining the relationship between maximum hourly demand and pump capacity versus storage requirements.

A city of 80,000 inhabitants will be considered operating on a flat rate basis, the average daily demand being 19.5 M.G.D., total consumption of water measured at the pumps. We will assume that the supply is being pumped from the underground waters, and that the plants are distributed throughout the city and pumping direct into the mains. Any additional pumping plants must be so located that interference between wells or overlapping of cone of depression will not be obtained, and that there is a limit to the number of pumps which can safely be installed in the area considered.

CHART A (†) is submitted herewith and shows the hourly load curve for the maximum month of the year studied, and represents the demand expressed

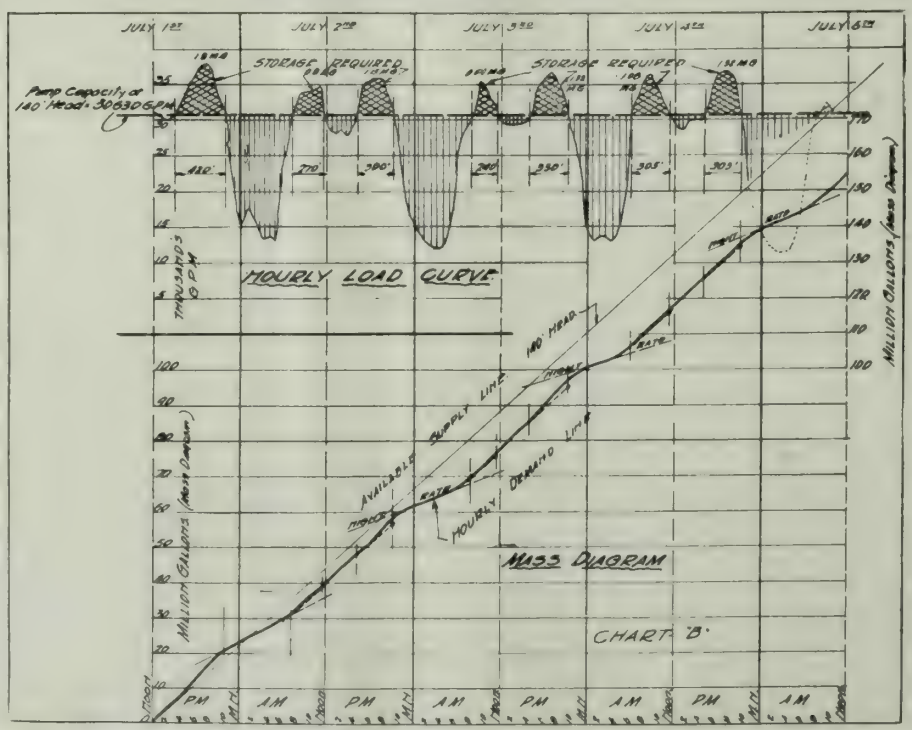

CHART B—Mass diagram and hourly load curve for maximum days of 1924. It is derived from the Chart A, which was too large to be reproduced in this article, and shows in detail the most interesting features visible in that chart, which plotted the hourly load curve for the entire course of the maximum month of the year studied.

*This article was presented by the author as a paper before a recent meeting of the California Section of the American Water Works Association, under the title "Balancing Reservoirs to Supplement Pump Capacity During Peak Demands." Acknowledgements are due to the Society and the author for permission to publish the article.

†EDITOR'S NOTE: Chart A, which the author describes, is not reproduced in this article, being too large for reproduction on a page. Its nature, and the conclusion to be derived therefrom, are apparent from the author's discussion. The most interesting study of this chart is made of the three maximum days, which are reproduced on Chart B, shown herewith, together with accumulative pumpage for the period. Chart B appears at the left.

in gallons per minute. The total consumption for the month is 1016 M.G. or 22,750 g.p.m.; this represents an average monthly load factor of 60.4 per cent. From a study of the performance curve of each pump, the capacity in this case was taken at a total head of 140 feet and then summarized, the result being the available supply at such a head, (namely 140 feet,) that normal service could be rendered. This is seen to be 30,630 gallons per minute. At all points wherein the demand curve is seen to be above the available supply line, then auxiliary capacity is required either in the form of additional pumps, or storage released. It is to be noted that there are only three or four days of the entire month that normal service could be rendered with the present pump capacity.

In order further to study the conditions, the three maximum days have been selected from Chart "A," and reproduced on Chart "B," together with a mass curve showing accumulative pumpage for this period. The mass curve is of the usual form, the demand line being accumulative pumpage, while the supply line represents available supply at 140 feet total head. Any line parallel to the supply line, and drawn tangent to the demand line, has a maximum ordinate whose value represents deficiency in supply. This is further shown on the hourly load curve, as all areas above the available supply line can be integrated and storage requirements determined. Summarizing the above, then it is seen that:

(1) That the average daily demand for the year=19.5 m.g.d.

(2) Pump capacity at 140 feet head=30,630 g.p.m.

(3) Maximum hourly demand (three day average) =36,764 g.p.m.

(4) That for approximately 10 hours for each of the three days selected, the demand was equal to or greater than the available supply, resulting in service being rendered at a reduced pressure head.

(5) Pump capacity in per cent of average daily demand =227 per cent.

(6) Peak demand (three day average) in per cent of average daily demand=273 per cent.

(7) Peak demand in per cent of pump capacity=120 per cent.

By reference to the mass diagram it is seen that the average night rate of flow is about 12,500 g.p.m., while the average rate during maximum demand period is about 33,000 g.p.m. or approximately 264 per cent of the night flow.

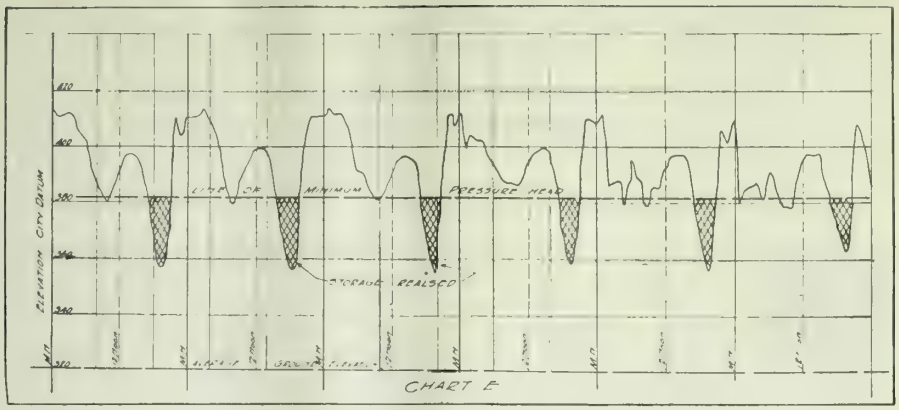

CHART E—Hourly elevation hydraulic grade line, Arlington Heights, maximum days of 1924. Fresno City Water Corporation.

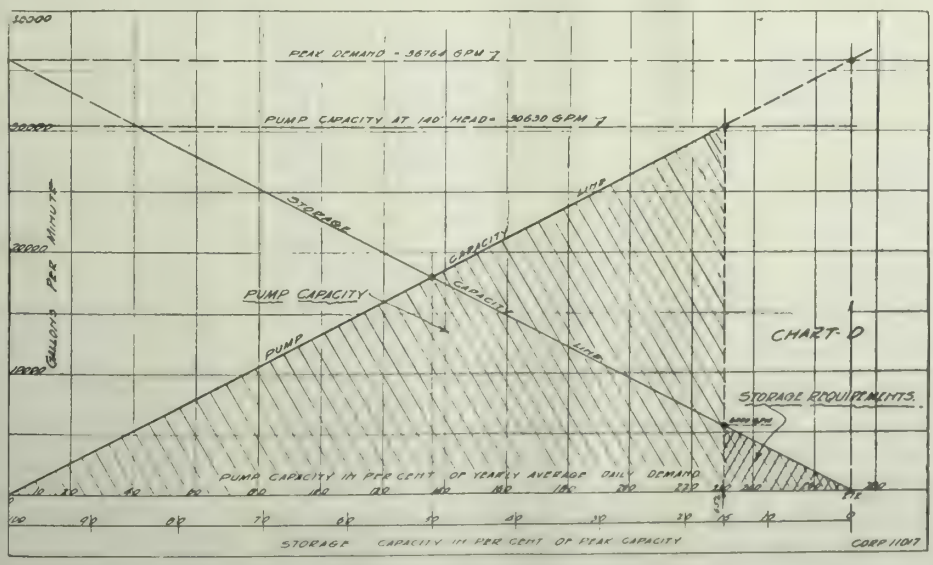
CHART "C" is now plotted as an average curve for the three maximum days and reflects the average system operating conditions from which final conclusions may be drawn, as to deficiency in supply during peak demand period, and pump capacity. From 4 P.M. until 9:30 P.M. it is obvious that the pump capacity should be either increased or auxiliary supply furnished in the amount of 1.35 m.g. If reservoirs are provided then, 13.5 m.g. mentioned above, and about 600,000 gallons during the morning load, or from 7 A.M. to 11.30 A.M. or in other words, about 20 per cent more capacity is required to equalize the flow during peak conditions.

Chart "D" represents graphically the operating condition of the system during this three day maximum period. It is seen at once that to supply the peak demand of 36,764 g.p.m. storage or auxiliary supply is necessary; with a pump capacity of 30,630 g.p.m., representing approximately 227 per cent of the yearly average daily demand, there remains a deficiency in the amount of about 17 per cent of the peak demand to be provided. Chart "D" is further useful in the determination of the economic solution of this problem as the cost of storage expressed in terms of per cent of peak capacity is readily balanced against cost of equivalent pump capacity in terms of per cent of yearly average daily demand.

It is assumed, herein, that if storage is to be provided that it will be utilized throughout the year, and the pumping plant so operated that maximum use of stored water will be obtained. By this scheme of operation certain plants may be shut down as the average daily demand decreases, allowing the remaining plants to operate at a higher load factor, and efficiency, which is very desirable in a system of this kind.



PEAK DEMAND = 36764 GPM
PUMP CAPACITY AT 140' HEAD = 30630 GPM
STORAGE
PUMP CAPACITY
CHART D
STORAGE REQUIREMENTS
PUMP CAPACITY IN PER CENT OF YEARLY AVERAGE DAILY DEMAND
STORAGE CAPACITY IN PER CENT OF PEAK CAPACITY
CORP 11047

CHART D—These curves show the relation of pump capacity to required storage capacity for the maximum days of 1924.

The economics of storage versus additional pump capacity should now be studied, and the annual cost of operation plus fixed charges of both schemes balanced. There will be found a point or a balanced condition wherein the total annual cost of operation of pumping plants expressed as a percentage of average daily demand will

(*Cont. on Page 36*)

Why Are Our Irrigation Organizations?

Leader of Hydraulic Developments in Northwest Discusses Proper Function of Idaho Congress

By WARREN G. SWENDSEN

State Reclamation Commissioner of Idaho, and President, Idaho Irrigation Congress

THE LAST session of the Idaho Irrigation Congress did me the honor of electing me president and since that time I have given no little consideration to the question of what excuse exists for the organization —whether or not after all we are justified annually in attending these gatherings and spending our time and money to engage in them.

It occurs to me that this is what might be properly termed an age of conventions, clubs and organizations and, perhaps, we are spending too much time in such activities. I am inclined, therefore, to suggest that an inventory be taken at this session with a view of determining whether this Congress should be continued, and, if so, what its future activities should be.

According to the best available estimates fifty per cent of Idaho's water supply available for irrigation is already devoted to that use and about six per cent of the total available water power is developed. This condition suggests that we have only fairly started the task of putting our water resource to a beneficial use. There can be no question but what the completion of this development presents a problem of vast importance to the entire state.

WHEN Mr. Swendsen prepared and delivered the following remarks, which are taken from his address to the annual meeting of the Idaho Irrigation Congress, he had in mind specifically the organization which he was to address as president. But there is much of general application and value to irrigationists and irrigation organizations in every part of the country in what he has to say, and for this reason his remarks are reprinted at some length.—EDITOR.

It is, however, an open question as to what institution of government or what organization is best equipped to assume the responsibility of directing plans designed to bring about the highest possible beneficial use of our unappropriated water supply. Quite independent of what organization, whether government or otherwise, undertakes this responsibility, it seems to me very evident that its solution must ultimately rest in the crystallization of public sentiment.

THE FOLLOWING problems appear to me to be of vast importance: We have a much greater area of desert land in Idaho than the total available water supply will accommodate even if it were all used in irrigation. Physical conditions suggest numerous schemes under which the surplus might be utilized. If the state's interest is to be adequately considered, and it is assumed that this is the sincere desire of all its citizens, and particularly this Congress, we must apply the remaining water supply to the areas and uses which will contribute the greatest possible benefit.

In the past this problem has not received consideration in its broadest aspect. Fortunately, however, the resource has not been dissipated or the development thus far has not been detrimental. Our success has, however, been more of a matter of luck than the result of scientific study. Economic errors have been made and it is not expected that they could be avoided in the development of a new country. We cannot forecast future conditions with such accuracy as to permit building an empire without the necessity from time to time of remodeling plans and wrecking structures, in order to meet continually changing conditions; indeed, such remodeling and changing is often, in the end, good economy. I believe if we profit by our past experiences, future development can progress in a more orderly fashion eliminating to a large extent economic waste.

For example, had we fully realized years ago the value and necesity of impounding water in the American Falls reservoir, we probably would have reserved a reservoir site for such use and thus avoided the later necessity of moving a town of considerable size, moving a portion of a transcontinental railroad, appearing before Congress to adjust the boundaries of an Indian reservation and purchasing accrued power rights.

Has the time arrived when we should begin to give consideration to matters of this kind in the building of our future

(*Continued on Page 24*)

HEATED discussion on various phases of state and national reclamation policies featured the annual meeting of the Washington Irrigation Institute at Yakima on February 10 and 11. Retiring president Ralph B. Williamson, in his annual address, vigorously attacked the "defeatist" attitude of the U. S. Bureau of Reclamation, asserting that "the $8,000,000 due and unpaid into the reclamation fund from the state of Washington, of which so much capital has been made, dwindles when it is disclosed that $44,000,000 has been paid, and the $8,000,000 is all that remains of a $52,000,000 debt."

The attitude of the state administration was given by Erle J. Barnes, director of conservation and development, who opposed the adoption of a state reclamation policy, declaring that state reclamation "does not work out." State Senator D. V. Morthland, as a representative of the majority opinion in the recent legislature, presented the other side of the picture of state reclamation, and urged that the Congress postpone any action adverse to state reclamation until after the report of the legislature's joint committee which is making an investigation of the problem.

F. A. Kern, of Ellensburg, secretary of the Kittitas reclamation district, was unanimously elected president of the Congress for the ensuing year. Under his direction the organization will undertake practical work on a scale not hitherto attempted. He was directed by resolution to appoint a standing committee of five to collaborate with the state supervisor of hydraulics in the formulation of a definite state program for obtaining an accurate survey of water resources of the state.

IRRIGATIONISTS of Idaho met in the joint session of the Idaho Irrigation Congress and the Idaho Chapter of the American Association of Engineers at Pocatello on February 25, 26 and 27. Leaders of reclamation, irrigation and engineering from all parts of the state were in attendance.

One of the principal matters discussed at the meeting was the extension of the scope of the organization to include more than irrigation developments, and the undertaking of a comprehensive program covering all phases of water development in the state. This was the recommendation made by W. G. Swendsen, state reclamation commissioner and president of the Congress. The organization is looking to a material broadening of its activities as a result of the meeting.

President Swendsen's address was the main feature of the opening day of the Congress, and his analysis of the water development needs of the state occasioned widespread interest. W. W. McLaughlin, head of the irrigation and reclamation work of the Division of Agricultural Engineering of the Department of Agriculture, addressed the meeting on the functions of his division as related to Reclamation. (His address is reprinted, in part, in this issue.)

"Federal Reclamation" was the subject of an address by Dr. John A. Widtsoe, well-known reclamation expert, on the second day of the convention. He was followed by William J. Hall, State Commissioner of Public Works, who spoke on "Public Works in Idaho."

The eternal snows of Colorado are her great water reserves. James Peak in winter garb, viewed from Moffat Road.

What Irrigation Has Done For My State—*COLORADO*

By M. C. HINDERLIDER

MR. HINDERLIDER is state engineer of Colorado. His is the second of a series of articles to be presented in MODERN IRRIGATION, *in which eminent westerners will tell what irrigation has meant to their respective states.*

COLORADO is pre-eminently an agricultural state, although classed, and properly so, as one of the eight arid states of America.

To those who have lived wholly in a humid region, the foregoing statement may seem paradoxical. To the Westerner, however, there is no enigma, since he is not accustomed to think of rainfall and humidity as essential to crop production. To him, successful agriculture means the artificial application of water to the soil through irrigation. Aridity plus irrigation means bountiful crops and agricultural achievements.

Irrigation is that art of ancient and modern civilizations, the practice of which enabled the early progenitors of man to exist, provided the foundation and support for the greatest civilizations of the past, succored the nations of more recent times, and now safeguards the existence of millions in their constant struggle with the grim spectre, famine. No other influence in history has had a more beneficent effect upon the well-being of mankind than has the practice of irrigation, and in no other country have the results of such practices been more pronounced, than in the State of Colorado.

Colorado is a commonwealth blessed beyond measure with scenic attractions of inspiring grandeur, with mineral wealth of endless variety, a salubrious climate unexcelled, great valleys of fertile lands, cradled among majestic mountains mantled with eternal snows; and with vast stretches of rolling plain requiring but the life-giving stimulus of irrigation. It is mighty empire of developed resources, splendid in present accomplishments, yet poor in comparison with future possibilities.

THE HISTORY of irrigation in Colorado is one of heroic achievement in empire building, and its annals are replete with the romance of a great work well done. Who, except one of prophetic vision, could have sensed the true significance of the struggles of those hardy pioneers of the early sixties, who through individual effort constructed the miniature canals for the growing of vegetable and forage crops needful for the bustling gold camps of those days? Or the great achievements resulting from the foresight and perseverance of those bold spirits, who, through a community interest, conceived and built the first extensive systems for reclaiming the supposedly sterile uplands adjacent to the streams, and pointed the way for those greater developments later made possible through corporate endeavor? Or the tremendous expansion over far-flung areas, through municipal, state and federal activities? Who but a seer could have visioned the great labyrinth of the twenty-eight thousand miles of canals now serving the four million acres of irrigated lands, or the thousand reservoirs with their millions of acre-feet of water, sufficient to submerge to a depth of many feet the entire city of Los Angeles and the San Fernando Valley. Surely these achievements constitute epics of transcending interest in the history of human endeavor.

What may *not* be said in praise of this genie which has changed dreary wastes into places of plenty, transformed uninhabitable areas into communities of activity, converted ravaged valleys and desert plains into well tilled farmsteads and happy homes, and unlocked nature's treasure houses with their great blessings of sufficiency?

UPON the results of irrigation in Colorado, a million people depend, and by virtue of its beneficent blessings, her future millions will rejoice in abundance. From her factories, wholly dependent upon irrigation, are annually produced two million tons of sugar beets, almost the equivalent of the combined output of all other sugar producing states of the West. An adjunct to this industry, that of livestock feeding, produces annually many thousands of head of finished cattle and hogs, and has made Colorado the greatest sheep feeding center in the United States. But for her irrigation practices, great livestock, mercantile, manufacturing, mining, and banking interests could not exist, and transportation systems would languish and cease to

"Intangible Realities"

ONE OF the most unusual and illuminating analyses of the key problem of reclamation—colonization—that has appeared in this magazine, or in any other publication, is Dr. Widtsoe's article in this issue, in which he gives the five essentials to a successful settlement policy.

It will be instantly noticed by the reader that three of the five essentials which Dr. Widstoe enumerates as the requisites for successful reclamation are not material factors. Five lessons have been learned, he declares, from great American experiments in land settlement. The first of these is "that no enterprise in colonization can succeed unless the project is adequate to enable the farmer to meet his obligations and to live properly in this day of high civilization." The second is that settlers must be selected in accordance with their fitness to live and labor under prevailing project conditions. The third lesson is that settlers must be aided, financially, technically and by friendly interest and encouragement. The fourth is that there must be an organized community life. The fifth—one which the author admits is difficult to define—requires a spiritual purpose, organized either around a church or some other expression of those intangible things which are nevertheless the most real stuff of human experience.

Every one of these five factors stresses the intangible—the things of the mind and spirit. The first and third are more than half matters of the heart and brain, rather than of the bank-account and material substance. The second, fourth and fifth are almost exclusively such.

There were men of prophecy, in days long gone by, who had the vision and the courage to pierce through the extrinsic manifestations of matter and to see, and declare, the underlying realities. They were more numerous then than now. Today, while there is no lack of unselfish purpose, and sincere dedication to the task, there is too much reliance on those things exclusively that may be seen and measured. Dr. Widtsoe is rendering a great service to all the irrigation brotherhood in bringing forcibly to its attention that while dams and ditches and dollars make farms possible, they do not make farms. While they may grow crops, they do not necessarily create satisfactions for human needs. Underlying the outward appearance there are those "intangible realities" that constitute the determining factors in human relations.

Should We Expand?

THERE are two ways of viewing the agricultural situation in the United States. One of these is admirably illustrated in the recently issued fourth annual "agricultural outlook report" of the United States Department of Agriculture. This report warns the American producer of farm products against any general expansion. Admitting that the farming industry is in the best general position that it has occupied since 1920, it declares that any general increase in production this year would tend to place agriculture in a less favorable position than it now holds.

The recommendations of the Department of Agriculture are based, it must be admitted, on very strong considerations. The so-called "business cycle" is not limited to commerce and industry. It applies with very great force to the economic and phychological motives that actuate the producer of farmstuffs. Today the farmer finds himself in a favorable position in the cycle, with his goods bringing fair returns in real income, and the danger is that these welcome circumstances will stimulate a chain of expansion and overproduction which will bring him again to a condition of glutted markets and unprofitable production. He needs to be warned, just as the manufacturer and the merchant need to be warned, that caution must be observed if he would maintain his pleasant position.

But there is another way of viewing the agricultural situation. It is a method that reckons not so much in terms of a given crop and a given market for a given year, but rather in the terms of the advancing population of the world and of each of its several parts, in relation to the food supply, also in-

POINT *Of* VIEW

creasing, but not keeping pace with the growing population.

The irrigationist, as a practical producer of goods which must be sold, is compelled to consider the immediate agricultural outlook from the standpoint typified in the report of the Department of Agriculture. But, as a believer in the movement of irrigation, he finds encouragement and justification and inspiration when he looks into the future, and views the gradual encroachment of population upon the large but not unlimited resources of America and of the world.

Our National Farm

AS CITIZENS of the United States we own a large farm. In the aggregate we have 1903 million acres. Like the farms of many individuals, our national farm land is not all of equal productivity. Authoritative government surveys indicate that only 800 million acres can be cultivated even after the population has greatly increased and the demand for food is much larger than now. It is estimated that forests will permanently occupy 360 million acres; that 425 million acres will always be poorly improved pasture or range land; and that 238 million acres are destined permanently to remain desert lands; and that 80 million acres will ultimately be used for the purpose of cities, roads, railroads, and other purposes which do not produce agricultural crops. Thus 1103 million acres, or 5.7 per cent of our national farm, is destined to be used only for purposes other than production of food.

At present we are cultivating approximately 500 million acres. From the figures above given it is apparent that we can increase our cultivated acreage only 60 per cent. Since the national farmer, like the individual farmer, has doubtless used the best land first, the 300 million acres left to be cultivated are likely to produce very much less per acre than the land now used. An estimate that they may produce only one-half as much per acre as the land now used seems to be conservative. On this basis the United States can increase its food production only 30 per cent.

Though we now have some surplus, especially during the years of maximum production like 1925, let us assume that we use all of the food produced during the average year and then view our needs of the future. Remembering that our population is increasing by approximately 1.6 millions annually, it is apparent that in 1946 we will have a population of approximately 143 millions, provided the present rate of increase continues. In a short period of only twenty years our own people may therefore consume all of the produce of our fully-developed national farm, provided the remaining three-eighths is only one-half as productive as the five-eighths now in use. On a more liberal assumption that the remaining 300 million acres is equally as good as the land now in use, we could increase our production only by 60 per cent. This would be enough to feed a total of 176 millions, a population which we will reach in 40 years, provided the present annual increase is maintained.

Of the 300 million acres yet to be reclaimed, 30 million must be made productive by irrigation, 60 million by drainage, 150 million by clearing of forests, and approximately 60 million by dry-farming. Remembering the important fact that thirty to fifty years are required to complete the development of large irrigation projects, it seems to be a wise policy to continue the construction of reservoirs and irrigation works, looking toward utilization of all of the waters of the West for irrigation and allied uses, and thus further the possibility of cultivating all of the arable land in our national farm.

A Poor Excuse

IT IS the privilege—or the misfortune, as it may be construed—of the editor of such a magazine as this to read, during the course of a month, literally hundreds of editorial columns in which the newspaper men of all parts of the country have set down their opinions on questions of irrigation and reclamation; voicing their opposition to or advocacy of contemplated projects, their condemnation of certain policies and their vigorous championship of others.

In several of the editorial expressions which have punctuated the unsteady progress of developments in the Colorado River debate, there has been visible a most interesting slant of opinion from editors in other parts of the country than the southwest. Many of the editors in Oregon, Washington, and Idaho, for instance, are enthusiastic in their congratulation of the southwest, and the whole country at large, and their own particular section especially, when something happens to lend color to the expectation that the federal government may soon proceed with the development of the Colorado.

"It's a grand and glorious thing that the government is about to do," they chorus, when a cabinet member's endorsement, or a committee's investigation apparently brings action a little closer. But their enthusiasm is based, not on the benefits which they forevision as accruing to the southwest, or the country as a whole, from such developments, but upon the assumption that the precedent thus established will lead to similar expenditures by the government in their own territory.

It is not intended to belittle the feasibility or the merit of any northwestern project, either actual or contemplated, by this observation. We are just as much interested in the development of the water resources of the northwest as of any other section. But the editors of any section, in support of any project, are doing an unwise thing when they seize upon federal approval of some other project, in some other section of the country, as the reason why their particular pet project should have federal attention. The future of reclamation, if it is to be a success socially and economically, depends upon each project standing four-square upon its own merits, and demanding attention by its unimpeachable feasibility. Reclamation in the long run will not be retarded. Its progress will rather be stimulated and assured.

Some Current Decisions of Western Courts Involving Irrigation and Drainage

Introducing a New Department Instituted in Response to a Widespread Demand From Readers

By HANKINS & HANKINS

Attorneys for Glenn-Colusa Irrigation District, San Francisco

IN RESPONSE to a widespread demand from readers, MODERN IRRIGATION has instituted a new department devoted to Irrigation Law. Under a departmental heading will be presented, each month, a short synopsis of current judicial decisions throughout the western states concerning irrigation and drainage. This department will be conducted by Messrs. Hankins & Hankins, of San Francisco, attorneys for the Glenn-Colusa Irrigation District of California. This firm of lawyers is not only widely experienced in irrigation legislation, but is also a large land-owner in the Sacramento Valley, with the result that they view the theory of irrigation laws with an understanding of the practical necessities of farming.—Editor.

Liability of Directors of Drainage Districts

Directors are severally and jointly liable for trespass, even when such trespass is committed by them in official capacity.

The Appellate Court of California, third district, in the case of Newberry et al v. Evans, et al., 49 Cal. App. Dec. 393 (Feb. 10, 1926), holds that the directors of a drainage district in entering upon the property of a landowner without his knowledge, consent or approval, and digging a ditch across such property, causing damage, constitutes a trespass for which the directors are severally and jointly liable, even if the acts complained of were committed by the directors in their official capacity, and that the only proper method of procedure was either to obtain the consent of the land owner or commence and maintain proceedings in eminent domain as provided for by the constitution.

The drainage district was originally a party defendant but was later dismissed, presumably under the idea that a suit could not be maintained against a drainage district under the provisions of the statutes of 1903. These provisions are practically identical with those of Sec. 15 of the California Irrigation District Act. The appellant court holds this to be error, apparently on the theory that it was not a question of negligence of the directors and thus differentiates the case from Whiteman v. Anderson Cottonwood Irrigation District, 60 Cal. App. 234.

The court further states, however, that if the drainage district, as a consequence of the action against the directors, actually obtained the possession of the land for ditch purposes, and was using the ditch in the same manner as though authority had been obtained through eminent domain proceedings, then the directors were jusified in issuing a warrant of the district to pay the amount of the judgment obtained against the directors, no question of the negligence of the directors being involved.

The case was reversed with instructions to the trial court to allow such amendments as would bring all issues squarely before the court.

District's Responsibility to Utility Obligations

An irrigation district is held to have the right to take over a public utility system free of public utility obligations.

The Glenn-Colusa Irrigation District, situated in Glenn and Colusa Counties, California, was organized to take over an unprofitable public utility water system. As part of the plan application was made to the State Railroad Commission for leave to make the transfer free and clear of public utility obligations. On this hearing certain land owners who had refused to include their lands in the irrigation district, filed objections, but upon the hearing the Railroad Commission allowed the transfer of the properties but provided that the protestants would be allowed a certain time within which to join the irrigation district. The protestants insisted that they could not be deprived of their right of service from a public utility, claiming it to be a vested property right, refused to join the district and after demand for service proceeded to use the water. The district brings an injunction suit to prevent this unauthorized use.

In the case of Glenn-Colusa Irrigation District vs. Paulson, et al., 48 Cal. App. Dec. 460 (Nov. 3, 1925) the Appellate Court upholds the district's position in refusing to deliver water and the action of the Railroad Commission. It also reiterates the law laid down in the case of Jenison v. Redfield, 149 Cal. 500 to the effect that an Irrigation District cannot deliver its water for use on lands outside of the district.
